Public Social Work and Welfare.—Housing.—Prisons and Crime Control.

XVI. Labor and Labor Legislation 663
Labor Conditions and Legislation.—Employment Conditions and Statistics.—Child Labor.

TABLE OF CONTENTS

DIVISION PAGE

XVII. RELIGION AND RELIGIOUS ORGANIZATIONS 692
Interdenominational Activities.—Protestant Denominational Activities.—The Roman Catholic Church.—The Eastern Churches.—Judaism and Jewish Communal Affairs.

PART SIX: SCIENCE—APPLICATION AND PRINCIPLES

XVIII. MATHEMATICS AND ASTRONOMY 743
Mathematics.—Statistical.—Analytical.—Astronomy.—Total Solar Eclipse.—Solar Spicules.—New Comets.—Novae 1945.—Variable Stars.—Andromeda Nebula.

XIX. ENGINEERING AND CONSTRUCTION 756
Structural Engineering.—Mechanical Engineering.—Electrical Engineering.—Radio.—Technical Progress in Sound Equipment.—Naval Architecture and Marine Engineering.

XX. GEOPHYSICAL SCIENCES 800
Earthquakes and Volcanoes.—Mineralogy and Petrography.—Terrestrial Magnetism and Electricity.—Meteorology and Climatology.—American Exploration.

XXI. CHEMISTRY AND PHYSICS 819
Physical Chemistry.—Physics.—Organic and Inorganic Chemistry.—Electrochemistry.

XXII. BIOLOGY 838
Organic Evolution and Genetics.—Entomology.—Botany.—Economic Botany.

XXIII. MEDICAL SCIENCES 866
Medicine. — Pathology. — Physiology. — Surgery. — Public Health.—Dentistry.—Vital Statistics.

XXIV. PSYCHOLOGY AND PHILOSOPHY 898
Psychology.—Philosophy.—Anthropology and Ethnology.

PART SEVEN: THE HUMANITIES

XXV. LITERATURE AND LANGUAGE 916
Fiction.—Poetry.—History.—War Books.—Biography.—Travel.—Criticism and Belles Lettres.—English Language and Literature.—Germanic Languages and Literatures.—Romance Languages and Literatures.—Latin Literature.—Greek Literature.—Semitic Languages and Literatures.—Slavic Languages and Literatures.—Linguistics.

XXVI. THE ARTS 989
Painting.—Sculpture.—Architecture.—Music and the Opera.—The Theatre.—Motion Pictures.

XXVII. EDUCATION 1028
Elementary Education.—Secondary Education.—Higher Education.—Vocational Education.—Adult Education.—Negro Education.—Libraries.

NECROLOGY 1087

PRESIDENT

COLONEL MARSTON TAYLOR BOGERT

VICE PRESIDENT AND SECRETARY

REAR ADMIRAL GEORGE H. ROCK, U.S.N. RETIRED*

BOARD OF DIRECTORS

COLONEL MARSTON TAYLOR BOGERT, *ex officio*
REAR ADMIRAL GEORGE H. ROCK, *ex officio**
MRS. WILLIAM H. PURDY
MR. GEORGE A. STETSON
DR. ERNEST M. PATTERSON
DR. MILTON JAMES FERGUSON
DR. FRANK W. NOTESTEIN

---

* Deceased, April 20, 1946.

CONSTITUENT SOCIETIES AND SUPERVISORY BOARD

SOCIETIES AND REPRESENTATIVES

1. **ACTUARIAL SOCIETY OF AMERICA.**
   James S. Elston, Travelers Insurance Co., Hartford, Conn.

2. **AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE.**
   Dr. Ernest M. Patterson, University of Pennsylvania, Philadelphia, Pa.

3. **AMERICAN ANTHROPOLOGICAL ASSOCIATION.**
   Dr. Clark Wissler, American Museum of Natural History, New York City.

4. **AMERICAN ANTIQUARIAN SOCIETY.**
   Clarence S. Brigham, Worcester, Mass.

5. **AMERICAN ASSOCIATION OF ECONOMIC ENTOMOLOGISTS.**
   Dr. L. M. Peairs, Editor, *Journal of Economic Entomology*, Morgantown, W. Va.

6. **AMERICAN ASSOCIATION OF MUSEUMS.**
   Dr. Laurence Vail Coleman, Director, American Association of Museums, Washington, D. C.

7. **AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.**
   Professor Edwin G. Conklin, Princeton University, Princeton, N. J.

8. **AMERICAN ASSOCIATION FOR LABOR LEGISLATION.**
   Mrs. Irene Osgood Andrews, 131 East 23d Street, New York City.

9. **AMERICAN ASTRONOMICAL SOCIETY.**
   Professor Henry Norris Russell, Princeton University, Princeton, N. J.

10. **AMERICAN BAR ASSOCIATION.**
    Chief Justice Harlan F. Stone, United States Supreme Court, Washington, D. C.

11. **AMERICAN CHEMICAL SOCIETY.**
    Colonel Marston T. Bogert, 1158 Fifth Avenue, New York City.

12. **AMERICAN COUNCIL OF LEARNED SOCIETIES.**
    Dr. Waldo G. Leland, 907 Fifteenth Street, Washington, D. C.

13. **AMERICAN ECONOMIC ASSOCIATION.**
    Professor Frederick S. Deibler, Northwestern University, Evanston, Ill.

14. **AMERICAN FEDERATION OF ARTS.**
Duncan Phillips, Director, Phillips Memorial Gallery, Washington, D. C.

15. **AMERICAN HISTORICAL ASSOCIATION.**
Professor Thomas C. Cochran, New York University, New York City.

16. **AMERICAN INSTITUTE OF ACCOUNTANTS.**
John L. Carey, Secretary, American Institute of Accountants, 13 East 41st Street, New York City.

17. **AMERICAN INSTITUTE OF ARCHITECTS.**
Charles T. Ingham, 1741 New York Avenue, Washington, D. C.

18. **AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.**
Henry H. Henline, 33 West 39th Street, New York City.

19. **AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS.**
Professor Bradley Stoughton, Lehigh University, Bethlehem, Pa.

20. **AMERICAN LIBRARY ASSOCIATION.**
Dr. Milton James Ferguson, Librarian, Brooklyn Public Library, New York City.

21. **AMERICAN MATHEMATICAL SOCIETY.**
Professor G. T. Whyburn, University of Virginia, Charlottesville, Va.

22. **AMERICAN MEDICAL ASSOCIATION.**
Dr. Frederic E. Sondern, 180 W. 58th St., New York City.

23. **AMERICAN ORIENTAL SOCIETY.**
Dr. Ludlow Bull, Metropolitan Museum of Art, New York City.

24. **AMERICAN PHILOLOGICAL ASSOCIATION.**
Professor George Depue Hadzsits, University of Pennsylvania, Philadelphia.

25. **AMERICAN PHILOSOPHICAL SOCIETY.**
Professor Gilbert Chinard, Princeton University, Princeton, N. J.

26. **AMERICAN PHYSICAL SOCIETY.**
Dr. Henry A. Barton, American Institute of Physics, 175 Fifth Ave., New York City.

27. **AMERICAN POLITICAL SCIENCE ASSOCIATION.**
Professor Arthur N. Holcombe, 573 Widener Library, Cambridge, Mass.

POLITICAL—NATIONAL AND INTERNATIONAL

DIVISION I
AMERICAN POLITICAL HISTORY

THE PRESIDENT AND HIS POLICIES

By Everett S. Brown
Professor, University of Michigan

CHANGE IN PRESIDENTS

Franklin Delano Roosevelt, the only President of the United States to be elected for more than two terms, died suddenly on April 12 at Warm Springs, Georgia, and was succeeded immediately by Harry S. Truman, of Missouri, the Vice President. President Roosevelt had served slightly less than three months of his fourth term.

ROOSEVELT'S STATE OF THE UNION MESSAGE

On January 6, 1945 President Roosevelt sent to Congress his message on the state of the Union. In it he declared that the war must—and would—be waged to ultimate victory. He warned, however, that we must never make the mistake of assuming that the Germans were beaten until the last Nazi had surrendered. Reviewing the basic strategy of the war, he said that the tremendous effort of the first years had been directed toward the concentration of men and supplies in the various theaters of action at the points where they could hurt our enemies most. He characterized the cross-channel invasion in Europe as "the greatest amphibious operation in the history of the world," but also emphasized the importance of the battle along the vitally important Italian front.

Turning to the Pacific, President Roosevelt related that during the year we had driven the Japanese back more than 3,000 miles across the Central Pacific, had cut their forces in the Philippines in two, and had struck a tremendous blow at Japanese naval power in the engagements in the waters of the Philippines. Our overall strategy, he said, had not neglected the important task of rendering all possible aid to China.

The President recalled that a year ago he had recommended that Congress adopt a national service act as the most efficient and democratic way of insuring full production for our war requirements, but that Congress had failed to do so. He repeated the call upon Congress to enact the measure for the total mobilization of all our human resources for the prosecution of the war. Stressing the shortage of nurses at army hospitals, President Roosevelt urged that the Selective Service Act be amended to provide for the induction of nurses into the armed forces.

In the field of foreign policy, the President said that we proposed to stand together with the United Nations not only for war but for victory after the war. He defended the principles of the Atlantic Charter and declared that we would not hesitate to use our influence to secure so far as humanly possible the fulfillment of those principles. He said that, while it was our purpose to help the peace-loving peoples of Europe to live together as good neighbors, we must not permit the many specific problems of adjustment connected with the liberation of Europe to delay the establishment of permanent machinery for the maintenance of peace. The President expressed pleasure at the return of the French nation to the ranks of the United Nations and said we fully recognized France's vital interest in a lasting solution of the German problem.

Returning to his discussion of domestic issues, President Roosevelt declared that we must have universal military training after the war, and promised to send a special message to Congress on the subject. He referred to the economic bill of rights which he had enunciated in the previous year and said that the Federal Government must see to it that these rights became realities. Although our policy would be to rely as much as possible on private enterprise to supply jobs, the President intimated that if private enterprise failed to do so the Government might assist through the development of our natural resources and other useful public works, among them our river-watershed projects, airports, and national highways. He also urged the expansion of the social-security program and adequate health and educational programs. He recommended to Congress the study of the tax system as preparation for peacetime encouragement of capital to invest and provide jobs. His suggestions included the reduction or elimination of taxes which bore too heavily on consumption.

The President closed his message on a level of high optimism and prophecy in these words: "This new year of 1945 can be the greatest year of achievement in human history. 1945 can see the final ending of the Nazi-Fascist reign of terror in Europe. 1945 can see the closing in of the forces of retribution about the center of the malignant power of imperialistic Japan. Most important of all—1945 can and must see the substantial beginning of the organization of world peace."

BUDGET MESSAGE

President Roosevelt, in his budget message transmitted to Congress on Jan. 9, 1945, stressed the fact that the actual expenditures of the Federal Government would depend largely on the course of the war. He proposed to use $70,000,000,000 as a tentative estimate of war expenditures for the fiscal year 1946. For purposes other than war he recommended appropriations, in general and specific accounts, to cover estimated expenditures of $13,000,000,000. He proposed no substantial change in tax legislation at the time of submitting the budget.

Referring to over-optimistic speculation about the possible cut in war expenditures when major hostilities in Europe came to an end, the President warned that we should make a great mistake if, in our military and budgetary planning, we should underestimate the task of defeating Japan. He added that the task in Europe would not end with the cessation of hostilities there but that we must accept our share of responsibility for the administration of occupied territories and for relief and rehabilitation in the liberated areas. The uncertainties of war required that the budgets of the military agencies should be sufficiently large and flexible to permit them to meet all demands that might arise.

Tentative estimates of appropriations included provisions for continuing lend-lease to our Allies. About one-sixth of the current war outlays, the President said, were for lend-lease and for relief and rehabilitation. He promised to continue lend-lease to the full extent necessary to win the war but added that it would be liquidated with the end of the war.

In his review of appropriations and expenditures for other than war activities, President Roosevelt pointed to the inevitable increase in expenditures for war veterans, interest in the public debt, and tax refunds. To insure continued agricultural production he recommended appropriations for the Department of Agriculture, including the War Food Administration, of $512,000,000. He described this as a wartime budget, which did not reflect desirable long-time objectives, namely, the elimination of malnutrition and rural poverty. He said that the Government was committed to support agricultural prices to farmers at a fair level for two years after the war. In the field of Social Security he asked Congress to give early consideration to extension and improvement of our social security system and to reexamine the financial basis of the program. He recommended reorganization of the basic structure of the Office of Education, stating that this reorganization would facilitate service to the states in the development of more adequate educational programs with proper emphasis on all the various aspects of education. Although recommendations for the actual construction of public works would be restricted to those projects which contributed to the war effort, the President urged that plans should be made for the post-war period.

While stating that reductions in the Federal personnel would be made as the course of the war permitted, President Roosevelt said that the main concern was to keep essential personnel on the job. He recommended that Congress enact permanent legislation authorizing overtime compensation of Government employees at true time and one-half rates, and also asked prompt reexamination of Federal salary rates with a view to making adjustments consistent with the national stabilization policy.

Summarizing estimated expenditures, the President pointed out that 84 per cent were for direct war purposes; 12 per cent were for veterans, interest on the public debt, and tax refunds; and only 4 per cent for all other activities of the Federal Government. With respect to receipts, he reported that under existing legislation they were expected to decline from $45,700,000,000 in the current fiscal year to $41,300,000,000 in the fiscal year 1946. He insisted that wartime taxes must be maintained as long as large-scale war expenditures were necessary but favored a policy of orderly but steady debt reduction, consistent with the objectives of long-run economic policy. Looking to the human side of reconversion, which required effective organization to aid discharged war veterans and war workers to find their way back into productive peacetime employment, the President said, that in addition to legislation then on the books, a strong, integrated system of public employment offices was a basic necessity. This objective could best be accomplished, he said, by the establishment, through permanent legislation, of an effective national employment service with adequate coverages throughout the nation. With respect to labor disputes, the President advocated the working out of a sound long-range policy implemented by permanent mediation machinery for the adjustment of labor disputes. He held that every effort ought to be made to achieve full civilian use of plants built for war purposes when they were no longer needed for war production and to facilitate their rapid transfer to private industry for productive use. He repeated his recommendation of the previous year that Congress make appropriations to provide statistical information concerning business activities and markets, employment and unemployment, incomes, expenditures and savings, which was urgently needed as a guide for economic policies during the remainder of the war and during the reconversion and post-war periods.

Referring to international financial affairs, President Roosevelt said that a concrete program for monetary and financial cooperation at an early date was essential. He urged acceptance of the articles of agreement for the establishment of an International Monetary Fund and an International Bank for Reconstruction and Development and recommended enactment of legislation which would permit the United States to make its proportionate investment in the Fund and in the Bank. He also recommended early expansion of the lending power of the Export-Import Bank. He stated that it was essential that legislation impeding our foreign investment programs by restricting loans to those countries which were in default on loans arising out of the First World War should be repealed.

In order to preserve the balance between incomes, savings, and expenditures, the President said it would be necessary to retain the machinery for allocation and price controls as long as certain materials and finished goods were in short supply. He therefore recommended extension of the Economic Stabilization Act before its expiration on June 30, 1945. He said that in general it would be our policy to hold the overall cost of living and to permit only such readjustments as were conducive to the full utilization of available resources and compatible with the general objective of economic stabilization. Controls, needed in war, must be readjusted to changing levels of war production and civilian production.

Estimating that as a result of postwar demobilization, before long there might be 60,000,000 men and women to be employed, the President declared that we must attack the employment problem on every front. This included overhauling the wartime tax structure to stimulate consumers' demand and to promote business investment; the provision of opportunities for new and growing business; and the development of the human standards and material resources of the nation. This program included social security and medical care; better education, public health and nutrition; the improvement of homes, cities and farms; and the development of transportation facilities and river valleys.

FOURTH INAUGURAL ADDRESS

In his inaugural address on Jan. 20, 1945 President Roosevelt declared that "in the days and years that are to come we shall work for a just and honorable peace, a durable peace." He added that "we have learned that we can not live alone, at peace; that our own well-being is dependent upon the well-being of other nations, far away. We have learned that we must live as men, and not as ostriches, nor as dogs in the manger. We have learned to be citizens of the world, members of the human community."

REQUEST FOR RESIGNATION OF JESSE JONES

In a letter of Jan. 20, 1945, President Roosevelt informed Jesse Jones that Henry A. Wallace deserved a reward for his unselfish service during the preceding presidential campaign, and since Wallace thought he could do the greatest amount of good in the Department of Commerce, the President asked Jones to give up his post as Secretary of Commerce. He expressed the hope that Jones would continue in government service and intimated that he might have an ambassadorship if he desired. Jones submitted his resignation but declined to consider the proffer of another position.

BRETTON WOODS PROPOSALS

In a message to Congress on Feb. 12, President Roosevelt recommended the immediate adoption of the Bretton Woods Agreements. He described them as the cornerstone for international economic cooperation just as the Dumbarton Oaks proposal for a permanent United Nations was the cornerstone for international political cooperation. He declared that it was time for the United States to take the lead in establishing the principle of economic cooperation as the foundation for expanded world trade.

REPORT ON YALTA CONFERENCE

On March 1, 1945, President Roosevelt reported to Congress on his conference at Yalta with Prime Minister Churchill and Marshal Stalin. The two main purposes of the conference, he said, were first to defeat Germany as quickly as possible and second "to continue to build the foundation for an international accord which would bring order and security after the chaos of war, and which would give some assurance of lasting peace among the nations of the world." He announced that arrangements had been made for periodic meetings of the Foreign Secretaries of Great Britain, Russia, and the United States at intervals of three or four months. He listed the problems of vital political consequence discussed at the conference. These were the occupation and control of Germany after victory; the differences over the international security organization after the Dumbarton Oaks Conference; the problems common to all of the areas liberated from the Nazi control; and the special problems created by Poland and Yugoslavia. On all of these matters unanimous agreement was reached.

In his report the President announced that a conference of all the United Nations of the world would meet in San Francisco on April 25, 1945. With a view toward gaining senatorial support for our participation in the United Nations Organization, he stated that the Senate and House of Representatives would both be represented at the San Francisco Conference, and, further, that our congressional delegation would consist of an equal number of Republican and Democratic members. He reported that France had been invited to participate as a fourth member of the proposed Allied Council on Germany and also to join as a sponsor of the International Conference at San Francisco. Regarding the lack of agreement at Dumbarton Oaks on the procedure of voting in the Security Council of the United Nations, the President said that a proposal made by the Americans and accepted by the British and Russians would be announced publicly in a short time. He regarded the conclusions reached on this point as "a fair solution of this complicated and difficult problem."

So far as the Yalta Conference as a whole was concerned, President Roosevelt characterized it as "a turning point in American history"—a choice soon to be presented to the Senate and to the American people whether we should take the responsibility for world collaboration or bear the responsibility for another world conflict.

POLICY TOWARD FRANCO

On Sept. 26, the Department of State made public a letter written by President Roosevelt on March 10 to Norman Armour, newly appointed ambassador to Spain, in which it was stated that Spain could not expect economic aid or other manifestations of friendship from the United States while a totalitarian government remained in control in that country. In the letter the President said he could see no place in the community of nations for governments founded on Fascist principles. He expressed the hope that the time might soon come when Spain would play "the role and responsibility which we feel it should assume in the field of international cooperation and understanding." The letter was interpreted as a diplomatic blow aimed at the régime of Generalissimo Franco.

POLICY RESPECTING PALESTINE

Letters exchanged between the King of Saudi Arabia and President Roosevelt on March 10, but not published until Oct. 18, brought out the President's policy on the dispute between Jews and Arabs in Palestine. President Roosevelt recalled to the King's attention that on previous occasions he had made clear the desire of the American Government that no decision should be taken with respect to the basic situation in Palestine without full consultation with both Arabs and Jews. He added the assurance that he "would take no action in his capacity as Chief of the Executive Branch of this Government, which might prove hostile to the Arab people."

ROOSEVELT MESSAGE ON TARIFFS

On March 26, President Roosevelt warned Congress that while the hopes for a peaceful world depended on the outcome of the San Francisco Conference, we could not succeed in building a peaceful world unless we built an economically healthy world. He therefore recommended to Congress the renewal of the reciprocal trade agreement program inaugurated in 1934, renewed on three occasions, and which was due to expire in June. After reviewing the history of the trade agreement program, the President recommended that the 50 per cent limit on rates be brought up to date by an amendment relating it to the rates of 1945 instead of 1934, thus giving the President the powers necessary to deal with other nations on the basis of the existing situation. He said the legislation was "essential to the substantial increase in our foreign trade which is necessary for full employment and improved standards of living."

FOOD AND AGRICULTURAL ORGANIZATION

Transmitting to Congress on March 26 for its information and consideration the first report to the governments of the United Nations by the Interim Commission on Food and Agriculture, President Roosevelt recommended that Congress authorize acceptance of the constitution and the participation of the United Nations in the work of the food and agricultural organization. He said that our participation would be an essential step in the collaboration of nations toward achieving freedom from want, although at the same time we would retain complete freedom of action in determining our national agricultural policies.

MANPOWER TRUCE

In a fourth direct appeal for enactment of a manpower control bill, President Roosevelt, on March 28, 1945, told the Senate that its rejection of the then pending compromise measure would make the successful conduct of the war even more difficult. He urged the Senate to adopt the conference report, even though the compromise was not all that was recommended by General Marshall, Admiral King, and himself. Adoption of the report would serve notice on our enemies that there would be no slowing down in our war effort, the President declared.

REPORTS ON UNRRA

In a letter of April 11, transmitting to Congress the quarterly report on UNRRA, President Roosevelt stated that UNRRA had shipped some supplies to the areas liberated from Nazi control and that its personnel had begun to aid in the distribution of these supplies. UNRRA, he added, had also begun to assist in the repatriation of the millions of the United Nations nationals who had been displaced by the war, as well as in the effort to control the spread of disease among the victims of war. The report disclosed that countries and peoples freed from Axis control would need $100,000,000,000 of food, clothing, and other relief, but the countries themselves would furnish about 92 per cent of their own needs.

ROOSEVELT'S LAST PUBLIC STATEMENT

President Roosevelt, in a speech written the night before he died and intended for delivery by radio on April 13 in observance of Jefferson Day dinners throughout the country, declared that Americans were determined there should not be a Third World War. He asserted that we sought enduring peace and "an end to this brutal, inhuman and thoroughly impractical method of settling the differences between governments" by wars. If civilization is to survive, he said, "we must cultivate the science of human relationships—the ability of all peoples, of all kinds, to live together, in the same world, at peace."

TRUMAN'S FIRST ADDRESS

In his first address to Congress on April 16, President Truman pledged warfare against Germany and Japan until their final and complete defeat. He appealed to every American to support the efforts to build a strong and lasting United Nations Organization.

UNITED NATIONS CONFERENCE AND CHARTER

Speaking over the radio on April 26 President Truman greeted the delegates to the United Nations Conference in San Francisco. He said that it was not the purpose of the conference to draft a treaty of peace in the old sense of the term but to devote its energies to the single problem of setting up the essential organization to keep the peace.

At the close of the conference the President delivered an address to the delegates on June 26. After complimenting them on the successful accomplishment of their allotted task, he said that the Charter of the United Nations was a solid structure upon which we can build for a better world. He predicted that the Charter would be expanded and improved as time goes on.

The President submitted the United Nations Charter to the Senate on July 2 and asked for its prompt ratification.

PRICE CONTROL AND LABOR POLICIES

On May 1, 1945, President Truman gave emphatic support to the Office of Price Administration and expressed the hope that Congress would extend the price control law for at least another year. On June 7 he declared that the Little Steel formula still stood, but he intimated that there might be a revision in the light of studies being made. On Aug. 9, in a letter to Chairman Krug, the President called on the War Production Board to extend into the reconversion program the spurs and controls it applied in building up the great production of the war, but he emphasized that restrictions should be lifted as soon as they were no longer required.

In a statement on Aug. 16, the President declared that our national welfare required that, during the reconversion period, production of civilian goods and services go forward without interruption, and that labor and industry cooperate to keep strikes and lockouts at a minimum. He said that, in the near future, he would call a conference of representatives of organized labor and industry for the purpose of working out by agreement means to minimize the interruption of production by labor disputes in the reconversion period.

When strikes shut off a third of the country's refinery capacity, President Truman on Oct. 4 ordered government seizure of 26 oil producing and refining companies and directed Secretary of the Navy Forrestal to operate them. In a speech delivered on Oct. 30 he advocated substantially higher wages for American laborers but held that prices must be kept stable. He said that wage increases were necessary to prevent deflation, but he warned that excessive wage boosts requiring higher prices would bring inflation. In an accompanying executive order, he provided the machinery under which the Government would give its approval to price increases necessitated by certain wage increase demands.

At the opening of the labor-management conference on Nov. 5 the President stated that the conference had been called in the expectation that it would furnish a broad and permanent foundation for industrial peace and progress.

On Dec. 3, President Truman announced his intention to set up fact-finding boards to deal with the General Motors strike and the threatened walkout of steel workers, and asked Congress for permanent machinery to handle labor disputes in important nation-wide industries. The proposed law would place a ban on strikes or lockouts for at least 30 days after certification by the Secretary of Labor to the effect that a dispute continued despite his efforts at conciliation. A fact-finding board, similar to the emergency board provided for under the Railway Labor Act, would be appointed by the President or his authorized agent. While neither labor nor management would be legally bound to follow the recommendations of fact-finding boards, the general public would know all the facts, with the result, the President hoped, that in most cases both sides would accept the recommendations.

On Dec. 12, the President named Judge Walter P. Stacy, Lloyd G. Garrison, and Milton Eisenhower as members of the fact-finding board in the General Motors strike. In another effort to control prices and to assist in solving the housing problem, President Truman asked that dwellings be placed under price control and directed reinstatement of the priority system on building materials. He named Wilson W. Wyatt, former mayor of Louisville, to be special housing expediter under the Office of War Mobilization and Reconversion.

A week later, on Dec. 20, President Truman issued a statement asserting that it was essential to the fulfillment of the duty of a fact-finding board in an industrial dispute where one of the questions at issue was wages, that the board have the authority to examine the books of the employer in order that it might determine the ability of the employer to pay an increase in wages. He expressed the hope that Congress would grant subpoena power to the fact-finding boards. He concluded his statement with the remark that "in view of the public interest involved, it would be highly unfortunate if any party to a dispute should refuse to cooperate with a fact-finding board."

ECONOMY PROGRAM

Because of changing war conditions, President Truman on May 2 recommended to Congress an economy program looking to the saving of more than $7,445,000,000 in the budget. The largest single item was that of $7,000,000,000 to be cut from funds available to the Maritime Commission for ship construction. He called for a reduction of more than $80,000,000 in the 1946 budgets of eight agencies and also informed Congress that he was terminating the Office of Civilian Defense by June 30 and withdrawing its proposed budget of $369,000 for the next fiscal year.

VETO OF FARM LABOR DEFERMENT

On May 3, President Truman vetoed a proposed amendment to the Selective Training and Service Act of 1940 which would have deferred registrants engaged in "agricultural occupations or endeavors essential to the war effort." He expressed doubt that it was the real intent of Congress that agricultural workers should be given blanket deferment as a group. The practical effect of the amendment, he said, would be to single out one special class of our citizens and put it on a plane above both industrial occupation and military service.

LEND-LEASE

President Truman transmitted to Congress on May 22 the nineteenth report of operations under the Lend-Lease Act. He asserted that lend-lease and reverse lend-lease as the basic mechanisms of combined Allied war supply made a vital contribution to the victory over Nazi Germany. While admitting that the task of reconversion and reconstruction was commencing, he said that lend-lease and reverse lend-lease must continue as a military necessity on the scale required to build the overwhelming power which alone could bring an early and complete victory over Japan.

On Aug. 21, the President directed the Foreign Economic Administration to take steps immediately to discontinue all lend-lease operations and to notify foreign governments receiving lend-lease of its action. At his press conference on Aug. 23, the President explained that lend-lease had been devised and used purely as a weapon of war and that, since there was no state of war, the vast United Nations' supply was no longer necessary. On Aug. 30, in his report on lend-lease operations, he told Congress that to attempt to collect the $42,000,000,000 sent to the United Nations in sinews of war would threaten their political stability and help sow the seeds of another war. He said that the lend-lease program had proved one of the most effective instruments of achieving victory and remarked that our Government was working out arrangements to bridge the gap left by the sudden ending of our financial support of the Allies.

REORGANIZATION OF EXECUTIVE BRANCH

In a message of May 24, the President called attention to the problem of an orderly transition from war to peace and asked Congress to enact legislation aimed at improving the organization of the executive branch of the Government. He suggested that the legislation should be generally similar to the Reorganization Act of 1939; that such legislation should be of permanent duration; that no agency of the executive branch should be exempted from the scope of the legislation; and that the legislation should be sufficiently broad and flexible to permit of any form of organizational adjustment for which necessity might arise.

UNEMPLOYMENT COMPENSATION DURING RECONVERSION

In a message to Congress on May 28, President Truman reviewed steps already taken to prepare the country for economic adjustments which the nation would face during the transition from war to peace but pointed to the lack of adequate benefits for workers temporarily unemployed during the transition period and urged Congress to close this gap. After a summary of the major effects of existing state laws, he recommended that Congress take emergency action to widen the coverage of unemployment compensation and to increase the amount and duration of benefits, at least for the duration of the emergency period. In his opinion, every eligible worker should be entitled to 26 weeks of benefits in any one year, if his unemployment continued that long, and the maximum payment should be raised from present levels to not less than $25 per week.

When the Senate Ways and Means Committee rejected the President's proposal and decided to postpone indefinitely further consideration of the Senate bill or related House measures, the President called the Democratic members of the committee into conference on Sept. 27, asserted that they had let him down, and said he expected the House not to follow their example.

PROSECUTION OF WAR WITH JAPAN

Presenting to Congress on June 1 a long and detailed account of the war against Japan, the President declared that our primary task was to win the war as completely and quickly as possible. Our military policy called for pinning down the Japanese forces and keeping them divided so they could be destroyed piece by piece; concentrating overwhelming power on each segment we attack; using ships, aircraft, armor, artillery, and other material in massive concentrations; and applying relentless pressure to the enemy so that he could not rest or reorganize his battered forces to meet our next attack.

SALARIES OF MEMBERS OF CONGRESS

Writing to Senator Kenneth McKellar on June 11, President Truman declared that "the salaries of the members of the House of Representatives and of the Senate should be commensurate with the nature and volume of their work and with their responsibilities." While it would not be possible or wise to increase the salaries to the proper level all at once, he suggested that the adjustment should be in the full amount consistent with the Little Steel formula. Later, congressional salaries, in his opinion, should be increased to at least $15,000.

SUCCESSION TO PRESIDENCY

In a message to Congress on June 19, President Truman asked for a change in the order of succession to the Presidency. Expressing the opinion that so far as possible the office of President should be filled by an elective officer, he recommended legislation placing the Speaker of the House of Rrepresentatives first in order of succession and the President *pro tempore* of the Senate second, to be followed by Cabinet members as at present provided. In all cases the person selected should not serve any longer than until the next Congressional election or until a special election called for the purpose of electing a new President or Vice President.

POLICY TOWARD UNRRA

On June 29 President Truman transmitted to Congress the third quarterly report on UNRRA. He reported that shipments of supplies were going forward in increasing volume to Greece, Poland, Yugoslavia, Czechoslovakia, and other nations but added that what had been accomplished was only a beginning. He said that the United States, as a member of the UNRRA, was determined to do its part in furnishing the ships and supplies required to meet critical needs.

In a message on Nov. 13, the President referred to the recommendation of the Council of UNRRA that each member country whose country had not been invaded by the enemy should contribute an additional amount to its original contribution equal to 1 per cent of its national income for the fiscal year 1943, and requested Congress to authorize a new appropriation of $1,350,000,000 for participation in the activities of UNRRA.

SURPLUS PROPERTY ADMINISTRATOR

Convinced that the effective performance of the vast administrative task remaining for the disposal of surplus property required that authority to make decisions and responsibility for those decisions should be centered in a single official, the President, on July 17, requested Congress to amend the Surplus Property Act of 1944 by substituting a single administrator for the present Surplus Property Board.

STATEMENTS OF FOREIGN POLICY

On the occasion of the raising of the American flag over the group control headquarters in Berlin on July 20, President Truman made an important pronouncement of American foreign policy in the following words: "Let us not forget that we are fighting for peace and for the welfare of mankind. We are not fighting for conquest. There is not one piece of territory or one thing of a monetary nature that we want out of this war."

From July 17 to July 25, he attended conferences of the Big Three at Potsdam at which important decisions and agreements were reached concerning the occupation of Germany and the policy with respect to other European countries. On Aug. 9 he made a report by radio to the American people in the course of which he stated that, although the United States wanted no territory or profit out of the war, we were going "to maintain the military bases necessary for the complete protection of our interests and of world peace." Such bases would be acquired, he added, "by arrangements consistent with the United Nations Charter." He declared that no secret agreements or commitments, apart from military arrangements, had been made at the Berlin Conference. Of the questions discussed he regarded winning the war against Japan as the most important. Referring to the use of the atomic bomb against Japan, he said that we would continue to use it "until we completely destroy Japan's power to make war."

In a Navy Day speech in New York on Oct. 24, the President laid down 12 fundamentals of the foreign policy of the United States:

1. We seek no territorial expansion or selfish advantage. We have no plans for aggression against any other state, large or small. We have no objective which need clash with the peaceful aims of any other nations.

2. We believe in the eventual return of sovereign rights and self-government to all peoples who have been deprived of them by force.

3. We shall approve no territorial changes in any friendly part of the world unless they accord with the freely expressed wishes of the people concerned.

4. We believe that all peoples who are prepared for self-government should be permitted to choose their own form of government by their own freely expressed choice, without interference from any foreign source. That is true in Europe, in Asia, in Africa, as well as in the Western Hemisphere.

5. By the combined and cooperative action of our war allies, we shall help the defeated enemy states establish peaceful democratic governments of their own free choice. And we shall try to attain a world in which nazism, fascism and military aggression can not exist.

6. We shall refuse to recognize any government imposed upon any nation by the force of any foreign power. In some cases it may be impossible to prevent forceful imposition of such a government, but the United States will not recognize any such government.

7. We believe that all nations should have the freedom of the seas and equal rights to the navigation of boundary rivers and waterways and of rivers and waterways which pass through more than one country.

8. We believe that all states which are accepted in the society of nations should have access on equal terms to the trade and the raw materials of the world.

9. We believe that the sovereign states of the Western Hemisphere, without interference from outside the Western Hemisphere, must work together as good neighbors in the solution of their common problems.

10. We believe that full economic collaboration between all nations, great and small, is essential to the improvement of living conditions all over the world, and to the establishment of freedom from fear and freedom from want.

11. We shall continue to strive to promote freedom of expression and freedom of religion throughout the peace-loving areas of the world.

12. We are convinced that the preservation of peace between nations requires a united nations organization composed of all the peace-loving nations of the world who are willing jointly to use force if necessary to insure peace.

ATOMIC BOMB

On Aug. 6, President Truman issued a statement announcing the first use of the atomic bomb. After a review of the history of the development of the bomb he said that, although normally, following the habit of our scientists, everything about the work with atomic energy would be made public, under present circumstances it was not intended to divulge the terminal processes of production or all the military applications, pending further examination of possible methods of protecting us and the rest of the world from the danger of sudden destruction. He announced that he would recommend that Congress consider promptly the establishment of an appropriate commission to control the production and use of atomic power within the United States.

Through an executive order issued on Sept. 13 the President sought to protect the sources of materials for the atomic bomb by barring the sale or other disposition of all public lands containing radio-active mineral substances. He followed this action by recommending to Congress, in a message under date of Oct. 3, that it enact legislation to fix a policy with respect to our existing atomic bomb plants, and to control all sources of atomic energy and all activities connected with its development and use in the United States. The legislation, in his opinion, should give jurisdiction for these purposes to an Atomic Energy Commission with members appointed by the President with the advice and consent of the Senate. Congress should lay down the basic principles for all the activities of the Commission, the objectives of which should be the promotion of the national welfare, securing the national defense, safeguarding world peace, and the acquisition of further knowledge concerning atomic energy.

On Nov. 15, President Truman and Prime Ministers Clement Attlee of Great Britain and W. L. Mackenzie King of Canada issued a joint declaration on atomic energy. They stated that they were "not convinced that the spreading of the specialized information regarding the practical application of atomic energy, before it is possible to devise effective, reciprocal, and enforceable safeguards acceptable to all nations, would contribute to a constructive solution of the problem of the atomic bomb." They advocated the setting up of a commission under the United Nations Organization to prepare proposals for extending between all nations the exchange of basic scientific information for peaceful ends and for the control of atomic energy to the extent necessary to insure its use only for peaceful purposes.

POLICY RESPECTING PALESTINE

Being asked at his press conference on Aug. 16 what was the American position on Palestine, President Truman replied that we wanted to let as many Jews into Palestine as was possible and still maintain civil peace. He revealed for the first time that this position had been registered with the British at the Big Three's Berlin Conference.

On Nov. 13 the President issued a statement in which he reported that the situation of the Jews in Europe and in Palestine had been the subject of frequent discussions with Prime Minister Attlee and that a formal agreement had been reached whereby a joint committee had been agreed upon to examine the entire question and make recommendations necessary to meet immediate needs.

POLICY TOWARD FRANCO

Asked at his news conference on Aug. 23 to elaborate on United States policy toward Spain, President Truman recalled the Potsdam declaration of the Big Three on their determination to outlaw the Franco régime from the United Nations organization, and added emphatically that "none of us likes Franco or his Government."

COOPERATION WITH DE GAULLE

At the end of General Charles de Gaulle's four-day visit to Washington on Aug. 25, President Truman and General de Gaulle issued a joint statement in which they reported that they had fully recognized "the fundamental harmony between French and American aims in the construction of the post-war world and have expressed their readiness to act in accordance with this mutual understanding by establishing an even closer cooperation between the two countries."

POLICY TOWARD CHINA

In a statement issued on Dec. 15, shortly after General George C. Marshall had left for China as ambassador, President Truman laid down the policy of the United States toward China. He set forth two primary points: (1) That a cessation of hostilities be arranged between the armies of the National Government and the Chinese Communists for the purpose of completing the return of all China to effective Chinese control; and (2) that a national conference of representatives of major political elements be arranged to develop an early solution to the current internal strife and bring about the unification of China.

The President intimated that if these things were not done China could not expect the post-war assistance she had anticipated; if they were, our Government would be prepared to consider favorably requests for credits and loans.

PEACETIME PROGRAM

President Truman sent to Congress on Sept. 6 a 16,000-word message outlining the peacetime program of his Administration. He proposed a 21-point program of legislation, calling for Congressional cooperation to insure that the transition from war to peace would not cause too much unemployment and to provide a stable economy and a high standard of living. He set as his immediate goal the following objectives: demobilization as soon as possible of armed forces no longer needed; cancellation and settlement of war contracts as soon as possible; clearance of war plants so as to permit contractors to proceed with peacetime production; holding the line on prices and rents until fair competition can operate to prevent inflation and undue hardships on consumers; holding wages in line where their increase would cause inflationary price rises; removing all possible wartime government controls in order to speed and encourage reconversion and expansion; keeping only those controls which are necessary to help reconversion and expansion by preventing bottlenecks, shortages of material, and inflation; and preventing rapid decrease of wage incomes or purchasing power.

The President's proposals for legislation included: legislation to supplement state benefits for the present emergency by increasing them to provide 26 weeks of protection to a weekly maximum of not less than $25, with coverage extended to include Federal employees, maritime workers, and others not now insured; a substantial increase in the 40-cent minimum wage to a level which will eliminate substandards of living; no action by Congress to proclaim the end of the war, in order to preserve war powers and wartime agencies necessary for the present; legislation authorizing the President to reorganize the executive branch of the Government; early action on the full employment bill to provide, among other things, machinery for a continuously full employment policy; legislation putting the Fair Employment Practice Committee on a permanent basis; continuation of the United States Employment Service at least until June 30, 1947, before returning it to the States; transfer of $500,000,000 of lend-lease funds to the Commodity Credit Corporation for price support; a well-rounded crop insurance program; continuation and strengthening of scientific research for agriculture and forestry; development of farm export markets and adjustment of farm programs to peacetime needs; providing Army and Navy inducements for voluntary enlistments, together with inductions from the 18-25 age group for maximum service of two years; broad and comprehensive legislation to help private enterprise build between 10,000,000 and 15,000,000 houses in the next ten years; Federal aid for slum clearance; resumption of the pre-war program of Federal aid for low-rent housing; quickening the rate of progress in rural housing; establishment of a single agency for Federal scientific research and the promotion and support of private research; providing as soon as possible limited tax reductions for the calendar year 1946; later modernization of the tax structure and further cuts; creation of a single administrator to replace the present three-man Surplus Property Board; clarification and liberalization of provisions for hospitals and medical care, vocational training and education loans guarantees and life insurance for veterans; social security coverage for the period of service; a program for regional development of the natural resources of the country's great river valleys, construction of Federal buildings, roads and airports, grants to states and municipalities for public works as well as Federal grants for hospital construction; salary increase to $20,000 for House and Senate members; repeal of the House expense allowance; provision of an adequate retirement system for members of Congress; adequate wage scales for the executive and judicial branches of the Government; and acquisition and retention of stock piles of materials in which the country is naturally deficient but which are necessary to supply the needs of national defense.

In the foreign field, the President said that, with the arrival of V-J Day, lend-lease aid had practically come to an end. He urged that lend-lease accounts should be settled on a basis of conditions which would "permit generally a sound world-wide economy and contribute to international peace and our own national economy." He stated that we were preparing to extend the operations of the Export-Import Bank and had taken steps to carry out the Bretton Woods proposals, the objective being to enable the peace-loving nations of the world to become self-supporting. He advised the repeal of the Johnson Act, and full American support of UNRRA.

On Sept. 17 the President issued a statement on aid to Europe in which he related that, with the exception of sugar, fats, and oils, the United States Government was in a position to fulfill the main requests of Europe. The limiting factor in meeting the minimum needs of the liberated peoples was no longer one of shipping but a problem of finance: how to work out credits or other financial arrangements with the European governments, and how to make additional funds available to UNRRA for emergency relief. The President said that it was an American responsibility to see that this country should do its full part in helping to restore health and strength to those who fought at our side in Europe and in the Far East.

UNITED STATES EMPLOYMENT SERVICE

The President pocket-vetoed a bill to cut back war-expenditure authorizations more than $51,000,000,000 because it carried a rider to return the United States Employment Service to the States within 100 days. He said that the rider would immeasurably retard the re-employment program at the very time local employment offices would be experiencing the peak work load in their history. He criticized Congress strongly for tacking the objectionable rider to a major appropriation bill which he found otherwise commendable.

CONSERVATION MEASURES

President Truman, by proclamations and executive orders, on Sept. 28 asserted the exclusive right of the United States to all mineral resources in the Continental Shelf running out to an off-shore depth of 600 feet from the United States, its territories and possessions. He also asserted this country's right to regulate and control all fishing grounds contiguous to its boundaries where such grounds have been developed exclusively by American nationals.

In dedicating the Kentucky Dam on Oct. 10, the President praised the Tennessee Valley Authority project as a genuine national achievement. He said that he had always been a supporter of the TVA and he favored the application of the same principles to other river valleys.

ST. LAWRENCE SEAWAY

President Truman sent a message to Congress on Oct. 3, strongly recommending the speedy approval by Congress of the arrangement of March 19, 1941, between the United States and Canada for the development of the Great Lakes-St. Lawrence Basin, as a part of the program of international cooperation, expansion of foreign trade, and domestic progress in commerce and industry.

POLICY TOWARD PHILIPPINES

In a statement read to his press conference on Oct. 3, President Truman served notice that he would not consider advancing the date for proclaiming the independence of the Philippines before July 4, 1946, unless and until adequate provision for their rehabilitation and satisfactory arrangements concerning their relations with the United States after independence had been made.

On Oct. 26, he warned that continued existence of a Philippines guerrilla army threatened the stability of government and declared that it must be disbanded while pro-Japanese puppets were being purged and punished. He made it plain that he was not satisfied with the steps which President Osmena's Government had taken to get the Philippines back on their feet. He was especially critical of the slowness of the Commonwealth Government in punishing disloyal leaders.

POLICY TOWARD PUERTO RICO

President Truman told Congress in a special message on Oct. 16 that the people of Puerto Rico ought to have a chance to decide their own political status. He urged legislation providing such an opportunity and suggested four possible alternatives to be submitted: the right of the Puerto Ricans to elect their own governor, with a wider measure of local government; statehood; complete independence; and a dominion form of government. Our Government, in the opinion of the President, should be prepared to carry into effect whatever options were placed before the people of Puerto Rico, once the Puerto Ricans have expressed their preference.

MILITARY TRAINING

Warning that peace must be built upon power, as well as upon good will and good deeds, the President urged Congress on Oct. 23 to adopt a plan for universal military training for young men in the 18-20 age bracket. No exemptions should be allowed except for total physical disqualification.

NATIONAL HEALTH PROGRAM

President Truman told Congress in a special message on Nov. 19 that the health of the nation was a national concern. Pointing to the large number of rejections for military service as disclosed by the examinations conducted by the Selective Service System, he listed five basic problems which must be attacked vigorously. These were the number and distribution of doctors and hospitals; the need for development of public health services and maternal and child care; medical research and professional education; the high cost of individual medical care; and loss of earnings when sickness strikes. To meet these problems the President recommended that Congress adopt a comprehensive health program, consisting of five major parts: the construction of hospitals and related facilities; the expansion of public health, maternal and child health services, with more generous Federal grants to the states; the undertaking by the Federal Government of a broad program to strengthen professional education in medical and related fields, and to encourage and support medical research; the distribution of costs of all necessary medical, hospital, and related services through expansion of the existing compulsory social insurance system, with coverage of needy persons through appropriate premiums paid for them by public agencies; and the payment of benefits to replace at least part of the earnings that are lost during the period of sickness and long-term disability.

ARMY-NAVY MERGER

On Dec. 19, President Truman asked Congress to merge the Army and Navy into a single department. Warning that any future war would erupt suddenly, with the United States very likely the first target, he asserted that unification of the services was the best means of keeping the peace. He coupled his program with an urgent plea to Congress to approve his request for compulsory military training for 18-20 year-old youths. The Presidents merger proposal provided for a new department of national defense under a single civilian secretary. Air, land, and sea forces would enjoy equal status, all three being under separate assistant secretaries.

IMMIGRATION POLICY

Stating that the United States shared responsibility for relieving the suffering of displaced persons and refugees in Europe, President Truman, on Dec. 22, ordered the admission of such persons into this country at a maximum rate of 3,900 a month under existing immigration laws. He said that, although he had no intention of excluding the issuance of immigration visas in other parts of the world, a decision had been made to concentrate the program in the immediate future in the American zones of occupation in Europe. Visas, according to the President, would be distributed fairly among all faiths, creeds, and nationalities. He urged that there be no further reduction in immigration quotas by Congress.

NATIONAL PERSONALITIES

JAMES F. BYRNES

After a long career in government service which included 24 years in Congress, 16 months on the Supreme Court, eight months as Economic Stabilization Director, and nearly two years as Director of the Office of War Mobilization (and Reconversion), James F. Byrnes retired from active duty in April, only to be recalled three months later to the secretaryship of State.

As War Mobilization Director, Byrnes adopted stern measures affecting civilian life at the beginning of the year. By his order all racetracks were closed Jan. 3, 1945, the use of electricity for display lighting purposes was prohibited, railroad transportation and supplies of heating fuel were reduced, and conventions of more than 50 persons, which were unnecessary to the war effort were requested not to meet after Feb. 1. To cope with manpower problems, Brynes favored reexamining agricultural workers' draft deferments and forcing into war work unemployed persons as well as men physically unfit for the armed services. In February 1945, all places of public entertainment, with the exception of restaurants serving only food, were asked by Byrnes to close at midnight in order to conserve fuel, manpower, and transportation. This request encountered little opposition except in New York City, where Mayor LaGuardia extended the curfew one hour past midnight, an act which Byrnes condemned but was powerless to modify.

Meanwhile, Byrnes attended the Big Three meeting early in February at Yalta, then flew to Washington ahead of the presidential party on Feb. 14 to discuss the conference with press representatives and Congressional leaders.

On March 24, 1945, Byrnes tendered his resignation as War Mobilization and Reconversion Director to President Roosevelt. Reminding the President that he had accepted the appointment with the expectation of not remaining to administer the reconversion program, Byrnes said he was convinced that, with victory near, his successor should take office immediately in order to become acquainted with the problems of, and to develop plans for returning the nation to peacetime economy. President Roosevelt accepted the resignation (March 31) with "heartfelt regret." and conveyed to Byrnes the nation's gratitude ". . . that we could fall back on the counsel you were able to give us out of an experience gained in the discharge of so many positions of the highest trust and responsibility." Similar tributes were expressed in Congress, where Senator Barkley, for instance, said that he knew of no one "whose departure from public service would create a greater vacuum."

Conferences in Washington between Byrnes and President Truman shortly after the death of Franklin D. Roosevelt in April led to rumors that he would be offered a post high in the Administration, but it was not until July 1 that the President nominated him for Secretary of State. Without referring the matter to a committee, the Senate confirmed it unanimously (July 2). Upon taking the oath of office, Secretary Byrnes disclaimed any intention of modifying the basic principles underlying United States foreign policy. Furthermore, he welcomed the guidance of Congressional experts and of former Secretaries Hull and Stettinius. No change would be made in the personnel of the State Department, he asserted, until completion of an investigation by the Budget Director. Almost immediately after assuming office, he accompanied President Truman to the Potsdam Conference where he took an active part in the discussions with the chiefs of state and the foreign ministers of Great Britain and Russia.

After returning to the United States Secretary Byrnes participated in the negotiations leading to the Japanese surrender. On Aug. 14, President Truman awarded him the Distinguished Service Medal for his wartime governmental services. In August also, he held conferences in Washington with Premier Soong of China and General de Gaulle of France. By threatening (Aug. 19) not to extend formal recognition to the Bulgarian Government unless elections scheduled there were free and representative of all elements, Secretary Byrnes was able to force a postponement of those elections.

Byrnes' staff in the State Department was revamped before he left to attend the London meeting of the Council of Foreign Ministers in September. The resignations of Under Secretary Grew and four Assistant Secretaries (Acheson, MacLeish, Holmes, and Rockefeller) were accepted, and Dean Acheson was named Under Secretary. To London Byrnes took as one of his advisers John Foster Dulles, foreign affairs consultant to Republican candidate Thomas E. Dewey in the 1944 presidential campaign. Although some progress was made, the conference became deadlocked on certain points; unsolved differences arose over admitting France and China to participation in treaty discussions for the Balkans, over Italian colonies and reparations, and over recognition of the Bulgarian and Rumanian governments. Shortly after arriving home the Secretary of State defended his position at the conference both in a radio address to the nation (Oct. 5) and in a detailed report to the Senate Foreign Relations Committee, whose members approved Byrnes' actions at London.

Nine nations were invited by the Secretary of State to attend a Far Eastern Advisory Commission at Washington (Oct. 23) concerned primarily with Japanese occupation policies. After Russia became the last of the Big Five and the twenty-ninth nation to approve the Charter framed at San Francisco, Byrnes' signing of the document late in October proclaimed the legal existence of the United Nations Organization. The announcement in November by Prime Minister Attlee of Great Britain, Prime Minister King of Canada, and President Truman of a plan to control the atomic bomb, led Byrnes to express the belief that within a few months atomic secrets could be entrusted to a special commission of the UNO.

Charges made by Major-General Patrick J. Hurley, who had recently resigned as Ambassador to China, that State Department diplomats had been sabotaging United States policy in China and Iran, were denied vigorously by Byrnes (Dec. 7) who loyally defended his subordinates. On Dec. 12, the Secretary flew to Moscow, despite adverse weather conditions, for another meeting with Foreign Ministers Bevin and Molotov. The official communique at the conclusion of the conference (Dec. 27) and Secretary Byrnes' radio broadcast to the nation (Dec. 30) disclosed that agreements had been reached on such major issues as the establishment of an atomic energy commission, an allied policy-making commission for Japan, recognition of Bulgaria and Rumania after further democratization of their governments, a five-year trusteeship for Korea, and the calling of a general peace conference. Appointed a delegate to the Assembly of the UNO, Byrnes flew to London on Jan. 7, for the opening session of that body on Jan. 10, 1946.

HARRY HOPKINS

The long political career of Harry Hopkins, close friend and confidant of the late President Roosevelt, ended at least temporarily in July 1945. As special adviser to the President, Hopkins had occupied a unique position. In recent years, much of his time had been devoted to problems connected with foreign affairs and the war, in contrast to his former concern with domestic matters.

In January 1945, Hopkins spoke out in favor of a long occupation of Germany and Japan and for compulsory military training in the United States. Late in the month, he flew to London, Paris, and Rome for conferences with Churchill, Eden, de Gaulle, and Pope Pius XII, then on to Yalta for the Big Three meeting in February. Following his return to the United States, poor health forced him to enter the Mayo Clinic (March 1) where he remained several weeks. After the death of Franklin D. Roosevelt, Hopkins supplied (May 4) President Truman with information on United States foreign policy, especially on the decisions made at Yalta, and discussed with him problems facing the United Nations Conference at San Francisco. On May 24, the President dispatched him to Moscow for special consultations with Marshal Stalin and other Soviet officials. During this mission Hopkins was credited with having persuaded Russia to withdraw her contention that the veto power of the United Nations Security Council should include the right of each permanent member to prohibit *discussion* of international issues or situations which might threaten world peace.

Illness and imperative need for rest were the causes stated for Hopkins' resignation early in July. At that time President Truman highly praised Hopkins for his loyal service and two months later (Sept. 5) awarded him the Distinguished Service Medal for his significant role in the Second World War. Meanwhile, Harry Hopkins accepted and entered upon the duties (Sept. 6) of a new position—impartial chairman of the New York City women's coat and suit industry. Thereafter his health failed rapidly, and he died in New York on Jan. 29, 1946. His death brought messages of appreciation from many parts of the world for his liaison service between President Roosevelt and President Truman, and the leaders of foreign states.

EDWARD R. STETTINIUS, JR.

Secretary of State in 1945 for only six months and a member of the State Department for less than three years, Edward R. Stettinius, Jr., nevertheless, directed United States foreign affairs with noteworthy skill during a period of significant advance toward world peace and security. Within a short interval he successfully undertook heavy responsibilities at the Yalta, Mexico City, and San Francisco conferences.

Early in January 1945, Stettinius announced that the United States would continue to recognize the Polish government in exile rather than the newly formed provisional "Lublin Government." In line with this policy and with the declaration made at the Yalta conference in February, the Secretary upheld (April 12) the exclusion of Poland from the United Nations Conference at San Francisco because of the failure to reorganize its government on a more democratic basis. In January also, Stettinius praised Turkey's breaking of diplomatic relations with Japan, supported the then Foreign Secretary Eden's suggestion for regular conferences of the Big Three, and approved of the proposed full employment bill with the reservation that our foreign trade should not be lessened by the "stimulation of uneconomic production" or by the introduction of "added rigidities into our economy."

After attending the Yalta conference the Secretary of State visited Moscow (Feb. 13-14), and then flew to Mexico City for the Inter-American Conferences on Problems of War and Peace. To the delegates of the latter conference Stettinius said (Feb. 22) that the good-neighbor policy and inter-American cooperation were considered by the United States to be "indispensable to the building, after victory, of a peaceful and democratic world order." The basic objectives of United States foreign policy described by Stettinius may be summarized thus: (1) final defeat of the aggressor nations; (2) complete demilitarization of Germany and Japan and permanent obliteration of their capacity to wage war; (3) the "right of every nation to develop free institutions according to its own desires"; (4) creation of an international organization to insure world peace; (5) attainment of a world in which "all men in all the lands may live out their lives in freedom from fear and want." The American Republics were assured of United States help in reducing the economic dislocations of war, promoting trade, stabilizing rates of exchange, and raising the standard of living.

President Roosevelt, in February 1945, appointed Secretary Stettinius chairman of the United States delegation to the United Nations Conference at San Francisco. When the Secretary announced (March 5) at Mexico City the issuance of invitations to the San Francisco Conference, he both explained and defended the formerly unpublished decision reached at Yalta on the voting procedure for the Security Council. After returning to Washington, he stated (March 15) that the United States would request opening the conference to the press and to the public. Moreover, he expressed (March 17) the hope that the principle of free access to, and exchange of information on an international basis would be incorporated in the United Nations Charter.

In a major address before the Council on Foreign Relations at Chicago, Secretary Stettinius stressed (April 4) that "no machinery for combined action to prevent or suppress aggression will work for any length of time in a world in which the causes of war, particularly the economic causes, are permitted to poison relations between countries." To help alleviate these factors, the United States, he said, favored lower tariffs, expanded investments abroad, increased foreign loans, settlement of lend-lease obligations in such a way as not to hinder trade, relief measures for liberated countries, prevention of cartels, and elimination of chronic world-wide surpluses of certain staples.

Two conditions essential for the establishment of a successful world organization were stipulated by Stettinius when he first addressed (April 26) the Conference at San Francisco: first, unanimous agreement and action by all leading military and industrial powers; second, voluntary cooperation of all peaceful nations to promote justice, human rights, and economic and social advancement. He further advised that in their deliberations the delegates, while striving to construct the best possible charter, should "not sacrifice approval to perfection" and should remember that their work "can be improved upon with time."

Contrary to expectations, opposition by the Russian delegation prevented the election of Stettinius as permanent president of the San Francisco Conference; instead, a compromise was adopted by which the presidency was rotated among the chief delegates of the four sponsoring powers. However, as permanent chairman of the important steering and executive committees, the Secretary of State wielded great authority. Although some American commentators attacked him both before and during the conference, he won widespread acclaim in the press and from most of the delegates for his tactful yet firm and efficient conduct of meetings and his effective leadership of the United States representatives. On several significant questions, such as the admittance or exclusion of Poland, the adoption of the clauses on human rights, regional security arrangements, and trusteeships, and the strengthening of the Economic and Social Council, Stettinius' influence was a major factor in the decisions reached. In recognition of his services, honorary degrees were awarded him by the University of California (May 4) and Columbia University (June 5, in absentia).

Midway in the conference the Secretary of State flew (May 24) to Washington to consult with President Truman. A few days later he reported (May 28) by radio to the nation on the achievements of the Conference to that date and asserted that the delegates would succeed in "writing a strong and democratic charter."

Stettinius' long-rumored resignation as Secretary of State was announced June 27, one day after the conclusion of the conference. At the same time President Truman named him United States representative on the Security Council of the United Nations Organization. Senate action on the nomination was postponed pending ratification of the Charter. In the meantime Stettinius appeared (July 10) before the Senate Foreign Relations committee to urge the Charter's approval. In August, the President appointed him United States representative (with ambassadorial rank) to the Preparatory Commission of the United Nations Organization.

Arriving in London (Sept. 1) to meet with the Executive Committee of the Preparatory Commission, he tried to speed the work so that the United Nations Organization could begin operations with as little delay as possible. Fitting tribute to Stettinius' accomplishments was paid in December by President Truman in naming him one of the five United States delegates to the Assembly as well as United States member on the Security Council of the United Nations Organization.

FRED M. VINSON

No political figure during 1945 occupied as many high-ranking offices in the United States Government as Fred M. Vinson. Formerly a member of the House of Representatives, Associate Justice of the Court of Appeals for the District of Columbia, and Chief Judge of the Emergency Court of Appeals, Vinson had succeeded James Brynes as Director of Economic Stabilization in 1943 and was still in that post at the beginning of 1945. Following the separation of the Federal Loan Agency functions from the Commerce Department, President Roosevelt nominated (March 6) him to be Federal Loan Administrator. When Brynes retired early in April as Director of War Mobilization and Reconversion, President Roosevelt, in his last major appointment, again turned to Vinson to fill an important vacancy. Finally, President Truman named (July 16) him Secretary of the Treasury. Both in Congress and in the press the selection of Vinson for these positions received widespread approval.

A primary aim of Vinson's policy throughout the year was to "hold the line" against inflation. As Director of Economic Stabilization, he forbade (Feb. 12) the making of so-called "fringe adjustments" in wages and salaries if they adversely affected the price stabilization program, and in March he set up specific, narrow limits within which such increases could be granted. In a report to President Truman he advocated (May 9) maintaining wage controls during reconversion, but approved increases for wage losses caused by the shorter work-week. Although he ordered (May 18) an additional subsidy for beef processors, retail prices were held at a firm level.

Vinson's two reports on reconversion (May and July) stressed the need for a gradual transition to civilian production. To cushion the economic shock however, he favored somewhat lower taxes, greater unemployment compensation, and higher minimum wages. When he recommended (Oct. 1) a cut of about $5,000,000,000 in Federal taxes for 1946—the first Secretary of the Treasury in 16 years to ask for a reduction in revenues—Vinson stated that the "only real solution of our tax problems and our debt problems is a high level of production, employment, and national income."

Other measures endorsed by Vinson in 1945 included the Bretton Woods monetary and banking plans, extension of the Price Control Act, expansion of the Trade Agreements Act, and the full employment bill. After victory in Europe he removed (May 9) the midnight curfew on amusements, and on July 12 he ordered an end to the drafting of physically unfit men over 26 years of age who left essential jobs. In a Memorial Day address at Arlington National Cemetery, he pleaded for the prevention of wars and depressions, both of which he described as "man-made institutions." During the fall he helped negotiate a loan of more than $4,000,000,000 to Great Britain. On Dec. 28, Vinson signed for the United States the document which formally established the international bank and monetary fund projected at Bretton Woods.

ARTHUR H. VANDENBERG

The impact on United States foreign affairs during 1945 of Arthur H. Vandenberg, Senator from Michigan, was of the first magnitude. A member of the Senate Foreign Relations Committee, Vandenberg participated effectively in the framing, ratification, and implementation of the United Nations Charter.

The key to Senator Vandenberg's thinking appeared in his now famous "collective security" address in the Senate on Jan. 10, 1945, an important milestone in America's progress toward international cooperation. While stressing the indispensability of unity among the United Nations, Vandenberg believed that fear of international dissension should not prevent public discussion of the issues peace would bring. Lack of candor by the United States had resulted in confusion rather than unity. In the Senator's opinion the United States should state clearly its stand on four points: dedication to the principles of the Atlantic Charter; acceptance of joint rather than unilateral settlement of international problems; subjection of all peace decisions to revision by the world organization; and proposal of better terms to the Axis for a quicker unconditional surrender.

In elaborating these primary aims, Senator Vandenberg greatly regretted the "shocking results" of President Roosevelt's dismissal of the Atlantic Charter as a "mere collection of fragmentary notes," an act which had "jarred America to its very hearthstones." These basic pledges, said Vandenberg, which "sleep with our martyred dead," must now be reaffirmed. Since no nation could any longer "immunize itself by its own exclusive action," he held that America must cooperate to maintain world order and peace. He attributed most of our contemporary friction with other nations to the "fear of reborn German aggression." To solve this difficulty Vandenberg proposed immediate adoption by the major powers of an agreement to keep Germany and Japan permanently demilitarized under which the President could act instantly without reference to Congress.

The effect of Senator Vandenberg's speech was momentous. Except for extreme isolationists most Americans were pleased. However, a Moscow publication attacked Vandenberg as an "imperialist." President Roosevelt called it a good address, and it possibly was a factor in his choosing Vandenberg in February as a delegate to the United Nations Conference. Before announcing (March 6) his acceptance of the assignment, the Senator noted that the President had assured him of freedom of action at the Conference. Later he suggested (March 18) a number of amendments to the Dumbarton Oaks plan, and he opposed (March 29) giving both the United States and Russia three votes in the Assembly.

In March 1945, Senator Vandenberg took a stand on certain other matters concerned with foreign affairs. He called attention in the Senate (March 8) to the vital task of creating a new Polish government that would be truly representative of all Polish interests and parties. Although he approved the bill to extend lend-lease, he insisted (April 9) that aid under the act should stop when fighting ceases, and that goods and services provided thereby must not be used for post-war relief or reconstruction. The United States should do its part in helping "to reconstruct a healthy, happy world," he said, but he thought that "we are neither big enough nor rich enough to become permanent almoner to the whole earth." Therefore, he asked the Administration to furnish an overall estimate of the external post-war obligations of the United States.

Upon leaving (April 20) to attend the San Francisco Conference, Vandenberg stated that, while he had no illusions about attaining the "millennium," he did have faith in the success of the venture. Recognized as one of the leading delegates at the Conference, he was instrumental in having the concepts of justice and international law included in the Charter's objectives, and he served prominently in the negotiations for a suitable formula on regional agreements.

After more than two months absence Vandenberg made (June 29) a preliminary report to the Senate advocating ratification of the United Nations Charter because the "alternative is physical and moral chaos in many weary places of the earth." He was convinced that not force but "the pacific settlement of disputes before they ever reach a fighting stage" was the main potential value of the new organization. Henceforth all issues would have to proceed through a regular course of "pacific routines" which would "stop almost every dispute short of the necessity for the consideration either of sanctions or of force." Moreover, justice, human rights, and fundamental freedoms would be guaranteed a hearing "under the healthiest possible auspices available."

In the committee hearings (July 11) and during the Senate debate (July 23-28) on the Charter, Vandenberg staunchly reemphasized his previously expressed views. In particular, he pointed out that, by joining the United Nations Organization, Congress would not abdicate its constitutional power to declare war, nor would it lack ultimate control over the American delegate on the Security Council.

Following Senate approval of the Charter (July 28), Vandenberg wrote (Aug. 5) to Secretary of State Byrnes advocating full presidential control of the United States forces assigned to maintain peace, and proposing that the job of policing the Western Hemisphere be turned over exclusively to the American Republics. Later he played an important role in getting enabling legislation passed to make United States participation in the United Nations Organization effective.

Senator Vandenberg proposed (Sept. 6) a resolution for the creation of a joint committee to deal with the development, control, and use of atomic energy. Although this measure was approved (Sept. 27) unanimously by the Senate, the House did not concur. The Senate then established its own Special Committee on Atomic Energy to the membership of which Vandenberg was appointed (Oct. 26). After the communique issued (Dec. 27) by the Moscow foreign ministers conference revealed that an atomic energy commission would be established, it was reported that Senator Vandenberg personally secured from President Truman assurances that no atomic bomb secrets would be disclosed until complete guarantees of security had been obtained.

Describing the Pan-American Union as "the greatest and the noblest regional arrangement on earth," the Michigan Senator spoke (Oct. 22) forcefully on the indispensability of maintaining sympathetic relationships and mutual engagements with the Latin-American Republics. Even more effective was his plea (Nov. 15) for reducing international friction by raising "the iron curtain of secrecy." Despite his belief in full freedom of international communications, however, Vandenberg successfully asked the Senate to defeat a proposal limiting American participation in foreign relief under UNRRA only to those countries which would allow free access to our press representatives. The climax of Senator Vandenberg's efforts for international cooperation came with his appointment by President Truman in December to be one of the United States representatives to the United Nations Assembly.

Other issues besides international security occupied Vandenberg's attention in the Senate. He opposed the national service and the full employment bills but supported (July 19 and 21) the Bretton Woods international monetary and banking plans and the Hot Springs international food organization. His proposal (July 30) to Secretary of Labor Schwellenbach for an industrial relations parley led to the calling of the labor-management conference in October. Although Senator Vandenberg favored higher unemployment benefits, he expressed dislike (Sept. 19) of the Administration-sponsored measure providing payments of $25 a week for 26 weeks because of objections to the practical effectiveness of the plan. The Washington, D.C. transit strike induced him to demand (Nov. 9) that a way be found to prevent strikes which violate collective bargaining contracts.

Indicative of the increased national stature attained by Senator Vandenberg in 1945 were the results of a poll conducted among party workers by the official Republican magazine which disclosed that, since 1943, he had registered the largest gain (40 per cent) in prestige and popularity of all the party leaders.

HENRY A. WALLACE

The nomination (Jan. 20, 1945) of Henry A. Wallace to be Secretary of Commerce precipitated an extensive political controversy in Congress. Protests were particularly vehement about a letter to the incumbent Secretary of Commerce, Jesse Jones, from President Roosevelt, requesting Jones to relinquish his post in favor of Wallace. According to President Roosevelt, Wallace deserved "almost any service which he believes he can satisfactorily perform" because of his active help in the campaign of 1944.

Wallace was characterized in Congress as an "impractical idealist" and a "starry-eyed dreamer" who lacked the business ability and economic philosophy necessary to manage properly the vast financial authority vested in the office. Not until a compromise measure severed the Federal Loan Agency from the control of the Secretary of Commerce did the Senate on March 1 confirm (56-32) the nomination.

In the meantime Wallace gained some political prestige by his outspoken self-defense. To a Senate committee he charged (Jan. 26) that the real issue behind the movement to strip the Commerce Department of its lending powers was not his personal deficiency in experience or competence, but whether or not the powers "are to be used only to help big business or . . . little business and to help carry out the President's commitment of 60,000,000 jobs." In New York City he stated (Jan. 30) that there were two goals in his fight: first, "jobs for all after the post-war boom is over"; second, to make the common man "better off in time of peace than he was in time of war."

As Secretary of Commerce Wallace testified in favor of extending the President's reciprocal tariff powers, urged legislation for tax adjustments, and backed the full employment bill. However, he opposed the establishment by war veterans of more than 500,000 to 700,000 new small business enterprises. During the fall he began a partial reorganization of the Commerce Department, recommended that a labor-supply census be taken every five years, helped Secretary of Labor Schwellenbach plan the labor-management conference, and contended that the automobile industry could increase basic wages 25 per cent by 1947 without raising prices and still continue to earn substantial profits. According to an unconfirmed report Wallace advocated revealing the atomic bomb secrets to Russia immediately.

In his book, *Sixty Million Jobs* (published in August), Wallace set forth the thesis that the Federal Government must assume responsibility for full, continuous employment whenever private enterprise, after stimulation and encouragement by the Government, fails to do so; government economic planning through a National Employment and Production Budget would be used to maintain national production at $200,000,000,000 a year and employment at 60,000,000 jobs. In line with this, he endorsed (Oct. 30) the Murray-Wagner full employment bill because it would establish confidence in the future, provide better coordination of government agencies, and set up simple but effective machinery and procedures to put the program into operation.

On June 4 the Churchman's Award for 1945 was bestowed on Wallace. As recipient of this honor he was described as "a man of vision who has dared to speak . . . against the privilege of the few and for the privilege of the many."

LEWIS B. SCHWELLENBACH

Former Senator Lewis B. Schwellenbach, since 1941 a Judge of the United States District Court for eastern Washington, reentered national politics in May when President Truman named him Secretary of Labor. Apparently loath to give up the bench, Schwellenbach reportedly consented to the Cabinet post only after considerable persuasion by the President. Leaders of both political parties and of organized labor in general were satisfied with the choice, and the Senate approved it with little opposition.

Soon after commencing his new duties (July 1) Secretary Schwellenbach broadcast to the nation his views on handling future labor relations. He emphasized that, because of its cost to all concerned, industrial strife must be eliminated. While both government and industry should try to minimize the workers' fear of unemployment, he insisted that employees as well as employers must recognize and accept their responsibilities. Schwellenbach cautioned that, although men "are entitled to the right to work," the "most powerful weapon a labor union has is the good will and the sympathetic support of the general public." It was his wish that labor respect the no-strike pledge and that management refrain from provoking labor in violation of that pledge.

Under Schwellenbach's direction, the Labor Department was partially reorganized (Sept. 18). Two new special assistants to the Secretary were named, three previously external labor agencies (War Labor Board, War Manpower Commission, and United States Employment Service) were incorporated into the Department, and the Conciliation Service was made the chief agency for settling labor disputes. To head the expanded Conciliation Service, Schwellenbach selected Edgar L. Warren, a former WLB regional director.

Following the termination of hostilities with Japan, several major labor contests arose, in few of which Secretary Schwellenbach and his cohorts were able to obtain satisfactory adjustments. The September oil refinery strike was ended only by government seizure of the plants after Schwellenbach's compromise proposal was rejected. A coal strike of four weeks duration ceased only because of a voluntary postponement by John L. Lewis. Likewise, mediation attempts by Schwellenbach and his aides in the General Motors Corporation strike (Nov. 21) met little success.

Meanwhile, the long-heralded management-labor conference, which was held during October and November in Washington under Administration sponsorship, failed to provide an adequate formula for work stoppages. In December, the Secretary of Labor backed President Truman's program for the establishment of fact-finding bodies to act in major labor disputes. By executive order such investigating boards were provided late in the month for the oil, steel, and General Motors disputes and were vested by Schwellenbach with authority to recommend wage increases based on inquiries of the employers' ability to pay.

HAROLD E. STASSEN

Although Capt. Harold E. Stassen, youthful (37) former Governor of Minnesota, was on active duty with the Navy for more than half of 1945, he received public attention through his work as a delegate to the United Nations Conference at San Francisco and from his speeches and writings.

Named a delegate to the San Francisco Conference by President Roosevelt (Feb. 13), Stassen immediately returned to the United States on temporary leave after spending nearly two years on Admiral Halsey's staff in the Pacific. At Washington he was awarded the Legion of Merit. He discussed the duties of his new post with Republican congressional leaders and with Governor Dewey of New York, and then exchanged views on international affairs with a number of faculty experts at Harvard University. His decision to accept the assignment was based on his belief that, irrespective of what effect it might have on his aspirations for the presidency, it was as much his duty "to work for a successful peace as it is to win the war."

Stassen voiced his opinions on world affairs in a radio address from Minneapolis (March 7), where he set forth the following "seven cardinal points" for future United States foreign policy: (1) join with our allies to build a permanent United Nations Organization based on justice and law and insured by force; (2) delegate a limited part of our national sovereignty to the United Nations Organization; (3) recognize that the welfare, peace, and happiness of America is necessarily linked to the status of the whole world; (4) use our productive capacity and wealth to advance standards of living throughout the world; (5) believe in freedom of information through press, radio, school, and forum as vital to world peace and progress; (6) strip aggressor nations of all means to make war; (7) remain a democracy characterized by free citizens, private capital, and individual enterprise, yet strive to improve its functioning and not prohibit study of other forms of government. Major goals for the proposed United Nations Organization, according to Stassen, should include the power of making basic, world-wide laws to permit the enactment at a future date of a "fundamental code of human rights," and the establishment of an international court with worldwide jurisdiction, a police force to maintain order and justice, and an effective and equitable system of trusteeships.

At the San Francisco Conference, Stassen played a prominent role. To help him understand and better represent the serviceman's viewpoint, he selected two wounded fighting men—a soldier and a marine—as his aides at the Conference, where he served on the subcommittee on trusteeships, defended the plan for the Security Council against the criticisms of small nations, and upheld the stand of the big powers on colonies. Shortly after the sessions at San Francisco were concluded, he appeared before the annual Governor's Conference at Mackinac (July 1) and in the nation's capital (July 5) to discuss the terms of the United Nations Charter and to advocate its immediate ratification.

Admitting that the charter was a "curious blend of idealism and realism," Stassen emphasized at Washington that its basic greatness lay not so much in specific provisions as in its capacity for growth and adjustment to future needs, and in the fact that methods were established "for peaceful change with justice and without war." He singled out for praise the Economic and Social Council as an "instrumentality for a continuing, constructive approach to the underlying causes of economic warfare and injustice," and he liked the responsibility imposed on nations holding trusteeships to make public reports on their stewardships. The General Assembly, he believed, would become the "world forum of the future."

After he rejoined the Pacific fleet for active duty in July, Captain Stassen participated in the Japanese surrender formalities and reported on a survey of Japanese prison camps. He then returned to Washington where, following a short period of service attached to the office of the

Secretary of Navy, he was honorably discharged in November. At that time Admiral Halsey described Stassen as a great naval officer, a great governor, and a man capable of performing the duties of any position the people entrusted to him.

Even prior to assuming civilian status, Stassen spoke out on current issues, and during the remaining weeks of the year he delivered several major addresses. At the height of the atomic bomb controversy, he proposed (Nov. 8) that world peace be maintained by a United Nations air force consisting of five bomber and ten fighter squadrons based at suitable points, each bomber squadron to be equipped with five atomic bombs furnished by the United States. Henceforth, manufacture of atomic weapons would be outlawed but atomic research would be permitted by registered scientists. In a speech before the National Association of Manufacturers (Dec. 7), Stassen called for a "real post-war economic conference" of government, labor, business, and agriculture, with the aim of projecting a "ten-year plan" in which all elements of society would unite "to champion and encourage and develop the basic American system."

To relieve the acute housing shortage, Stassen urged (Dec. 12) a number of measures, including (among others) the appointment of a national housing expediter, the release from the armed services of all skilled tradesmen not needed for immediate military purposes, the training of construction workers by an expanded apprentice program, the leasing for temporary occupancy of unused Army and Navy barracks, and the revision of city building ordinances which unnecessarily restrict home construction.

On Dec. 14, Stassen expressed the opinion that the United States should demand immediate cessation of armed intervention by the British and Dutch in Java and that the problem should be submitted to the United Nations Assembly in January for study and recommendation. Speaking to the American Bar Association at Cincinnati (Dec. 19), he asked the assembled lawyers to search for new answers to the needs of government and proposed that a committee of the Bar Association visit Russia and other foreign countries with the ultimate goal of establishing a basic international code of rights.

ROBERT E. HANNEGAN

Robert E. Hannegan, chairman of the Democratic National Committee throughout 1945 and Postmaster-General of the United States since July 1, announced in January 1945 that plans were already being made for the next Congressional elections. On numerous occasions Hannegan stressed the importance of a Democratic victory in 1946. At Rochester (March 17) he contended that the 1944 election results made it obligatory for all those who voted for Roosevelt to support the Administration's program and to "follow through" by assuring a Democratic majority in Congress.

President Truman's nomination (May 3) of Hannegan to be Postmaster-General was vigorously opposed by Senator Donnell of Missouri, who objected to the fact that the members of the Senate Committee on Post Offices had been merely "polled" by the chairman (McKellar) without calling a formal meeting, and who tried at length but in vain to have the nomination recommitted to the committee for hearing on Hannegan's fitness. Donnell questioned the appointment on such grounds as Hannegan's retention of the chairmanship of the Democratic National Committee, the vast patronage at the disposal of the Postmaster-General, and particularly a series of incidents in Missouri political life and elections from 1934 through 1941, but the Senate confirmed (May 8) the nomination with only two dissenting votes.

At a testimonial dinner in his honor following his confirmation, Hannegan told Democratic Congressmen that their party members would be given preference in appointments to Federal jobs. This "return to the spoils system" was roundly criticized by Mayor LaGuardia and others. On July 4 at Gainesville, Ga., the new Postmaster-

General praised the "splendid manner in which President Truman has measured up to his unparalleled responsibilities," emphasized the need for post-war cooperation through the United Nations, and called for a "job for every man and woman who wants to work."

After victory in the Far East, Republican Congressmen were warned (Sept. 17) by Hannegan that with the war over they could no longer "conceal their final objectives behind platitudes or counsels of perfection," nor could they "get by with endorsements in principle and amendments that would cancel out the principle they have endorsed." In St. Louis, Hannegan assured (Sept. 18) businessmen that the Truman Administration would assist them "to the limit consistent with good government in time of peace" through such means as easing regulations and lowering taxes. At French Lick, Ind. he charged (Nov. 17) that Republican leaders in Congress were "still voicing defeatism," trying to overthrow the social and economic advances made under the New Deal, and attempting to "smear" Franklin D. Roosevelt in the Pearl Harbor investigation.

THOMAS E. DEWEY

Defeated as Republican candidate for President in 1944, Thomas E. Dewey, Governor of New York, devoted the year 1945 mainly to the affairs of his own state. In his January 1945 message to the New York legislature, he recommended such matters as reform and extension of workmen's compensation insurance, greater benefits for the unemployed, and additional state funds for public housing projects. Later he demanded passage without amendment of a bill outlawing discrimination by employers because of race, religion, color, or national origin, a bill which became law by his signature in March. The Civil Service Reform Association, in May, praised the Governor's record in regard to laws affecting New York state administrative organization and services.

Speaking to Republicans assembled at Washington for the annual Lincoln Day dinner (Feb. 8, 1945), Governor Dewey emphasized American unity during war, demanded that the United States "take a full, responsible part in the establishment of collective security among nations," pledged Republican support to President Roosevelt's efforts at the Yalta Conference, yet insisted that the "decisions to be made shall be in harmony with our American ideals of liberty and justice" and that the "actions to be taken shall not be concealed and shall not be devious." Late in February he discussed with Commander Stassen the principles by which the latter would be guided as a delegate to the United Nations Conference at San Francisco.

In June, Dewey said that if world economic warfare were to be prevented and lasting peace preserved, existing curbs on international trade must be abolished. For the United States he specifically urged the lowering of tariffs, cancellation of debts of the First World War, repeal of the Johnson Act, settlement of lend-lease obligations in such a way as to "promote mutually advantageous economic relations," joining the international bank and international monetary fund proposed at Bretton Woods, and long-term stabilization of the dollar-sterling exchange rate.

Governor Dewey played a prominent role at two gatherings of state chief executives. The first (June 19) was a meeting of 12 northern state governors to discuss food shortages. At the second, the 37th annual Governors' Conference at Mackinac Island, he asked for quick ratification by the Senate of the recently framed United Nations Charter, and he stressed the necessity of states cooperating with each other to improve their governmental structure and administrative efficiency.

Local politics claimed Dewey's attention to some extent during the summer and early fall. In late August, he made a five-day tour through the northern counties of New York in behalf of Republican candidates. In the New York City Mayoralty race, Governor Dewey supported Judge Jonah J. Goldstein, who suffered a decisive defeat in the election. This defeat, coupled with the results of a poll taken by a Republican organ among more than 4,000 party workers which showed that Dewey's decrease in popularity was greatest of all the party leaders, may not lack political significance.

In September, Governor Dewey exchanged telegrams with President Truman over the St. Lawrence River seaway project. The Governor, fearing that the Administration was about to sponsor a measure providing for the seaway only, threatened (Sept. 19) to oppose the entire project unless it also included the development of waterpower resources. President Truman immediately assured Dewey that he was "enthusiastically in favor not only of the St. Lawrence waterway but also of the water power on the river." Furthermore, the President voiced the opinion that, once constructed, the power facilities should be turned over to New York State.

After it was disclosed in September that Dewey knew about the United States breaking Japanese military and diplomatic codes before December 1941, but had refrained from using this information during the 1944 campaign because of an urgent request for secrecy from General George C. Marshall, a political controversy ensued in which the Governor took no part. Repercussions from this incident cropped up during the congressional committee investigation of the Pearl Harbor disaster when Senator Lucas demanded (Dec. 15) that inquiries be made as to how Dewey had first learned of the American interception of Japanese code messages, but no action was taken. In the meantime, Governor Dewey's appearance before a United States District Court as the representative of nine northern states resulted in an injunction (Dec. 21) restraining the United States Interstate Commerce Commission from enforcing its May 15 decision ordering differential freight rate adjustments between the North and the South.

ELLIS G. ARNALL

Few state governors received more national publicity during 1945 than Ellis G. Arnall, the young chief executive of Georgia. Governor Arnall continued with vigor and success his efforts for governmental reform which, during the previous two years, had resulted in lowering the legal voting age to 18, modernizing budgetary procedures, protecting educational institutions against political interference, and reforming the prison system.

When the Georgia legislature failed to abolish the poll tax at his request, Governor Arnall threatened to do so by executive order, thereby forcing the legislature to adopt the measure. In March, he argued in person before the United States Supreme Court for permission to file suit against 20 northern railroads for anti-trust law violations, charging them with conspiracy to fix discriminatory freight rates against Georgia (and other southern) shippers. The Court voted (5 to 4) to hear the case. Further success came in May when the Interstate Commerce Commission ordered southern freight rates decreased ten per cent and northern rates increased by the same amount.

During the first week in July Arnall attended the 37th annual Governors' Conference at Mackinac Island, where he served on the resolutions committee and was named to the executive committee of the organization. The crowning achievement of his gubernatorial career came when the people of Georgia approved (Aug. 7) a new, progressive state constitution, framed earlier by a Commission which he headed. Rumors circulated (Sept. 4) that President Truman would appoint Arnall Solicitor General of the United States, but they proved false.

Insight of Governor Arnall's political philosophy can be found in his description of the American way of life—or freedom—as the "right of the individual to lead his own life in his own way, free of the threat of interference so long as he interferes with no other man's freedom." For years Arnall has expressed concern about the relative economic status of the

South and the North. With aggressive action to end the sources of southern poverty, which he believes to be the fundamental cause of all the ills affecting his area, the Governor predicted in July that the Southern States could look forward to a great future.

THE YEAR IN CONGRESS

By Mary Sumner Benson
Professor, Milwaukee-Downer College

ORGANIZATION AND COMPOSITION

The first session of the Seventy-Ninth Congress convened Jan. 3, 1945. The Senate contained 57 Democrats, 38 Republicans, and one Progressive, a line-up which showed little change from the previous session. The House, with 243 Democrats, 190 Republicans, one Progressive, and one American-Laborite, showed a Democratic increase of 21 over the beginning of the Seventy-Eighth Congress. Senator Alben W. Barkley was re-elected majority leader and Senator Kenneth McKellar became president *pro tem* of the Senate. In the House, Speaker Sam Rayburn was re-elected. John W. McCormack and Joseph W. Martin, Jr. served as majority and minority leaders, respectively.

GENERAL

Congress was at once confronted with a variety of problems, some domestic, others connected with the conduct of the war. Matters of international security and cooperation were also conspicuous. In his message to Congress on the state of the union, President Roosevelt especially urged a national service act, more effective use of men classified as "4-F," induction of nurses into the armed forces, and universal military training after the war. He suggested that tax modifications be planned for the end of the war in Europe, to encourage capital to invest in new enterprises and to provide jobs; but he thought that there should be no major tax revision until after the war should have ended on all fronts. He also restated his "American Economic Bill of Rights" in plans for post-war economy and made a strong appeal for world unity. The President's budget message on Jan. 9 showed the same combination of war problems with the possibility of peacetime revision of appropriations and controls. International responsibilities were again emphasized in his Bretton Woods message of Feb. 12.

COURSE OF LEGISLATION

Congress had a brief recess at Easter time. The death of President Roosevelt on April 12, although a shock to Congress as to the nation, did not materially change the course of legislation. The end of the war in Europe brought some modification of wartime controls, as for instance the change in the excess profits tax. Congress planned for a summer vacation, the first of any length in several years. The House recessed July 21, intending to return Oct. 8. The Senate remained in session until Aug. 1, to complete ratification of the United Charter.

The principal measures of this first part of the year included extension of the Trade Agreements Act, approval of the Bretton Woods agreements, expansion of the lending authority of the Export-Import Bank, approval of membership in the United Nations Food and Agricultural Organization, extension of Lend Lease, and membership in the United Nations Organization, a most important body of legislation in the international field. Domestic measures for the same period included extension of the draft law, increase of the national debt limit, continuation of price control, salary increases for postal and other Federal employees, and approximately

$59,000,000,000 of appropriations. Quite a large part of the domestic program was left for action in the fall.

The end of hostilities on Aug. 14 shortened the summer recess, and Congress reconvened on Sept. 5, to face a period of reconstruction. The next day President Truman sent a message with a 21-point legislative program, dealing partly with the end of the war and partly with long range policies. The fall months were marked by intensive discussion of economic measures and by investigations, notably those on Pearl Harbor and on atomic energy control. President Truman sent a number of messages. Among the most important were those dealing with atomic energy control, universal military training, and the merger of the armed services.

Major bills passed in this period provided for participation in the UNO, appropriated new money for UNRRA, cut income taxes and repealed the excess profits tax, revised the "G I Bill of Rights," and authorized government reorganization. There was also a measure cutting current and past unused appropriations by $52,000,000,000, but this was vetoed after the close of the session. In all, some 290 public laws were passed during the year. The session ended on Dec. 21, 1945.

The year's achievements in international relations were notable. There were many domestic matters awaiting action in the second session which opened Jan. 14, 1946. Among these were universal military training, merger of the armed services, salary increases for members of Congress, labor legislation, revision of social security, "full employment" measures, establishment of a permanent FEPC, and domestic control over atomic energy. Approval of the $4,400,000,000 loan to Britain was also pending.

AGRICULTURE

Legislation passed early in the year appropriated $6,784,000 for completion of an agricultural census. The Agricultural Adjustment and Soil Conservation Acts were amended to protect the acreage allotments of cotton, wheat, and peanut growers who had shifted to war crops and so were not eligible for benefits under the original acts. Appropriations were authorized for distribution to states for more county-extension work. The sums were $4,500,000 for 1946, $8,500,000 for 1947, and $12,500,000 for 1948. The distribution will be made in the same manner as in the Smith-Lever Act. A measure was also passed revising the Farm Credit system to make it more efficient and simplify the procedure for loans.

AIRCRAFT

The provisions of the National Motor Vehicle Theft Act were extended to include the transportation of stolen aircraft in interstate or foreign commerce.

APPOINTMENTS

Many new appointments were made during the year. On March 1, Henry A. Wallace was confirmed as Secretary of Commerce after the Federal Loan Agency had been made independent of the Department of Commerce. Other cabinet appointments were those of Tom Clark as Attorney-General, Robert E. Hannegan as Postmaster General, Lewis B. Schwellenbach as Secretary of Labor, Clinton Anderson as Secretary of Agriculture, James F. Byrnes as Secretary of State, Fred M. Vinson as Secretary of the Treasury, and Robert P. Patterson as Secretary of War. Vinson had recently been approved as Federal Loan Administrator and in April as Director of War Mobilization and Reconversion. John W. Snyder succeeded him first as Federal Loan Administrator and later as Director of War Mobilization and Reconversion.

The Senate rejected Aubrey Williams as Rural Electrification Administrator. Claude R. Wickard was later confirmed for this post. David E. Lilienthal's reappointment as chairman of the Tennessee Valley Authority was confirmed in May. In the Army nine full generals were confirmed in March, giving the Army its greatest number of full generals. Most notable of the Army and Navy confirmations of the year were those of Dwight D. Eisenhower as Army Chief of Staff and Chester W. Nimitz as Chief of Naval Operations. Harold H. Burton, formerly Senator from Ohio, was unanimously confirmed as Associate Justice of the Supreme Court on Sept. 19.

At the session's close the Senate confirmed the delegation to the United Nations Organization, Edward R. Stettinius, Jr., Senator Tom Connally, Senator Arthur H. Vandenberg and Mrs. Eleanor Roosevelt. The fifth delegate was the Secretary of State, whose name did not require confirmation. Stettinius was to serve as representative on the UNO Council as well as delegate to the General Assembly. Confirmed as alternates were Representatives Sol Bloom and Charles A. Eaton, Frank C. Walker, former postmaster general, John Foster Dulles, and John G. Townsend, former senator from Delaware.

APPROPRIATIONS

President Roosevelt on Jan. 9, 1945 sent to Congress the budget for the fiscal year, 1946. In his message he emphasized the need of planning not only for an all-out war program but for one which would provide a full-employment peace economy. He estimated that $70,000,000,000 would be needed for war purposes in the fiscal year, but made it clear that unobligated balances of war appropriations no longer needed would be placed in reserve and reported to Congress for action. For other than war purposes he estimated that $13,000,000,000 would be needed. This represented an estimated drop of $17,000,000,000 from the amount appropriated for the fiscal year, 1945. A revised estimate as of July, 1945, still showed the war expenditures as $70,000,0000,000 and placed others at $15,288,000,000.

In September President Truman asked Congress to rescind $3,500,000.000 of appropriations and contract authorizations to 20 war agencies. It was clear, however, that some changes would not appear until the budget for the fiscal year, 1947. At the close of the session, appropriations had reached a total of $69,780,000,000, of which approximately $62,000,000,000 was counted as new appropriations. Toward the close of the session Congress passed a measure rescinding some $52,000,000,000 of war appropriations and authorizations, only part of which belonged under the 1946 budget. After Congress had adjourned, this measure was vetoed by President Truman because of a rider which ordered the return of the United States Employment Service to the states. The President ordered the Budget Bureau to see that the money was not spent until Congress should have taken further action. The effect of the end of the war and the proposed cutbacks is to make the total amount appropriated during the year somewhat misleading.

Among the major appropriation acts of the year were the following:

First Deficiency Appropriation, 1945	$2,600,000,000
Treasury and Post Office	$1,343,000,000
War Department Civil Agencies	$112,450,940
War Agencies (Civilian)	$769,364,850
Independent Offices	$3,000,000
Agriculture	$594,724,527
State, Justice, Commerce Departments	$270,000,000
Navy	$23,421,000,000
Legislative Branch	$50,994,481
District of Columbia	$64,000,000
Interior Department	$102,602,628
Labor-Federal Security	$1,100,736,922
Military Appropriations	$38,620,904,581
Second Deficiency Act, 1945	$18,000,000
First Deficiency Act, 1946	$2,388,201,630

The measure for the 20 civilian war agencies was not passed until July 13, 13 days beyond the usual deadline. The original bill had called for $446,200 for continuation of the Fair Employment Practice Committee for another year. This resulted in a filibuster in the Senate. FEPC was supported by a working coalition of Republicans and Northern Democrats and opposed by Southerners. The matter was finally compromised by granting FEPC $250,000. The amendment giving this sum was somewhat ambiguously worded but suggested complete termination of the agency by the end of the 1946 fiscal year.

President Truman in his message of Sept. 5 asked that the agency be made permanent. In the House there was an effort to cut the funds for the Office of War Information to $18,000,000, less than half the sum originally asked, but it finally received $35,000,000.

ARMED FORCES

Measures connected with the armed forces were numerous. New problems were raised by the cessation of hostilities, and action on several controversial matters was left incomplete at the end of the session.

A bill was passed in January, increasing the Naval Reserve Officers Training Corps to 24,000 until one year after the cessation of hostilities, then continuing it at 14,000. The rank of general was created for the Marine Corps and the Coast Guard, with the proviso that each body should have only one such officer and that the authority to fill the post should end after the war. It was provided that military or naval academy appointments for sons of service men who had received the Congressional Medal of Honor or died in action should not be charged against the existing admission quotas of the states. Age limits for eligibility to enter the academies were raised for veterans of the Second World War.

The problems of compulsory service and universal military training proved difficult to solve. In his opening message President Roosevelt asked that a national service act be rushed through. Congress attempted to meet this by partial measures, and a limited manpower draft bill passed the House on Feb. 1, providing that men between 18 and 45 who left essential jobs or refused to take them, be subject to induction, fine, or imprisonment. The Senate passed a "voluntary" manpower bill of its own. A compromise bill was rejected on April 3, despite the President's pleas. Proposals for a draft of nurses met with no success. A resolution which would have continued the deferment of large numbers of agricultural workers was vetoed by President Truman as his first major veto. His objection was that it conferred special privileges on a group. The veto was promptly sustained by the House. A bill providing for the extension of the Selective Service Act to May 15, 1946, or to the date of the termination of hostilities as specified by Congress, was passed in May. President Truman signed it reluctantly because it contained a proviso that no man under 19 should be sent into actual combat service without at least six months of military training. This, he felt, put undue restrictions on the Army and Navy.

As hostilities ended, the question of post-war training became acute. On Oct. 24 President Truman asked for a year's military training for young men to provide a trained reserve. Extensive hearings on the matter were held by the House Military Affairs Committee, and the plan was strongly advocated by General George C. Marshall, then Chief of Staff, by Secretary of War Patterson, General Eisenhower, Dr. Karl T. Compton of the Massachusetts Institute of Technology, and Gen. William S. Knudsen. Admiral King urged it as necessary for the building up of an organized naval reserve. Dr. George F. Zook, president of the American Council on Education, asked delay in action to permit study by a commission to be appointed by the President. Dr. James B. Conant suggested the extension of Selective Service on a year-to-year basis with the term of draftees limited to 15 months. This would give time for the study of the way in which the atomic bomb affected the armed forces. Various organizations sent representatives in opposition to the proposal. No action had been taken by either house at the close of the session.

Steps were taken to maintain and to extend the Regular Army. In June, enlistments were permitted during the war period up to the total enlisted peacetime strength of the Regular Army. In October this measure was clarified and extended to both the Army and Navy, and enlistment in the Regular Army was opened to all qualified males over 18 with no limit on numbers. New retirement provisions for the Regular Army comparable to those now in force in the Navy were introduced. Special inducements for reenlistment of discharged veterans were offered, such as furlough travel allowances, acceleration of mustering-out payments, and a reenlistment allowance. The benefits of the "G. I. Bill of Rights" and the free mailing privilege were also given recruits. The Army and the Navy were encouraged to undertake recruiting compaigns.

The House in October voted for a peacetime Navy of 6,084 warships, totaling 4,698,000 tons.

UNIFICATION PROPOSAL FOR ARMED FORCES

One of the most controversial matters of the year was the bill to merge the armed forces into a single unit. Long and vigorous hearings were held on the matter. In general there was a cleavage between the Army and the Navy on the desirability of the merger. Among the most vigorous witnesses for this were General Marshall, General Eisenhower, and General Doolittle. Secretary of the Navy Forrestal submitted a Navy Plan for National Security to the Senate Military Affairs Committee on Dec. 12 which would coordinate action through a National Security Council to which joint Chiefs of Staff would report but would leave the present forces and departments separate. On Dec. 19, the President sent a message urging a single Department of National Defense with co-equal status for land, sea, and air forces and a single secretary in the Cabinet. He suggested a commander for each branch responsible to a Chief of Staff selected on a rotating basis. Among those testifying in opposition to the merger were Admiral Nimitz, who reversed his earlier views on the basis of further study, Admiral Leahy, and Admiral Halsey. Several bills differing in many points were introduced but action was incomplete at adjournment.

ATOM BOMB

The atom bomb was the subject of much study. A jurisdictional dispute developed in the Senate as to which committee should have charge of bills dealing with atomic energy. This was resolved by the creation of a Select Senate Committee on Atomic Energy with 11 members. In the House the Military Affairs Committee studied the subject and recommended passage of an atomic energy act, drafted by the War Department and designed to control the domestic aspects of the problem. Each committee heard testimony of scientists and military men. Major General Leslie who controlled development of the bomb urged the ending of his own control and replacing it with a nine man commission. He favored continuance of the manufacture of the bomb for the present. Professor Harold Urey thought domestic control should be placed under a director or a small *ex-officio* commission but that the weapon should no longer be made. Other scientists gave their views. In general witnesses approved the plan of President Truman, Prime Minister Attlee and Prime Minister King for placing international control of atomic energy under a commission responsible to the UNO. Final action was deferred until 1946.

DEBT LIMIT

The limit on the public debt was increased from $260,000,000,000 to $300,000,000,000.

FEDERAL EMPLOYEES AND CONGRESSIONAL PAY

On June 30, President Truman signed a bill giving Federal employees a basic wage increase averaging 15.9 per cent and time and one half for overtime. This affected most Federal civil service employees except for the Post Office Department and a few other specified groups. It was the first general increase for Federal workers since 1923 and was estimated to add $736,000,000 to the Federal payroll.

In the Legislative Branch supply bill of June there was a provision for a $2,500 annual expense account for

House members retroactive to Jan. 2, 1945. The Senate refused to vote this for itself, although it did not disapprove the House payment. President Truman signed the bill, though he disapproved of the method employed. He was decidedly in favor of an increase in the pay of congressmen.

The Administration proposed giving an increase of approximately $10,000 to most top Federal officials in legislative, executive, and judicial branches of the government. No action was completed on this measure.

At the close of the session a bill was being considered which would grant pay increases to 1,000,000 Federal officials, justices, judges, and other workers and members of Congress. It would amount to a flat 20 per cent increase for employees under the Classification Act and $5,000 for most of the superior offices.

FOREIGN SERVICE

A measure was passed to improve the quality and efficiency of the Foreign Service. It provided for the creation of an administrative and fiscal branch in the service; temporarily removed the percentage limits on promotion in the service because of wartime difficulties; permitted the assignment of members of the State Department to Foreign Service for four-year periods, as well as qualified persons from other departments or agencies; permitted the assignment of Foreign Service members to the State Department; and made some other changes designed to improve personnel.

HOUSING

An amendment to the National Housing Act permitted the increase by $100,000,000 of the aggregate amount of mortgages under Title VI of the National Housing Act and extended the authority of the Federal Housing Administration to insure under this title until July 1, 1946. This clause provides for government insurance of privately held mortgages on privately owned war housing in localities in which the President finds an acute housing shortage which would impede the war effort. The previous authorization under this title was exhausted early in 1945. Special funds to aid in housing for veterans were also included in the final deficiency bill of the year.

INSURANCE

In 1944 the Supreme Court decided that insurance is interstate commerce and so subject to Federal regulation. Congress therefore passed an act stating that regulation and taxation of insurance by the states is in the public interest and may continue. It was specified that the anti-trust provisions of the Sherman, Clayton, and Federal Trade Commission Acts would apply to the insurance business after Jan. 1, 1948, to the extent that the state had not acted. No change was made in the application of provisions of the National Labor Relations Act, the Fair Labor Standards Act, or the Merchant Marine Act to insurance.

INTERNATIONAL FINANCE

Lend Lease was extended until June 30, 1946, with clauses which precluded the use of lend-lease funds for post-war reconstruction and rehabilitation; however, certain contracts were not to be regarded as post-war relief, specifically those in which the United States agreed to furnish to a foreign government articles for defense or war services and provided for the disposal of these articles on terms prescribed by the President after he had determined that they were no longer needed for defense. The estimates made in June to Congress for expenditures under Lend Lease were for an appropriation of $1,975,000,000 of new funds and the use of $2,400,000,000 of unappropriated balances, a marked reduction from that for 1945. Lend Lease was suspended by President Truman immediately after the surrender of Japan.

Congress voted to approve participation by the United States in the Bretton Woods pacts for an International Monetary Fund and the Bank for Reconstruction and Development. Approval in the House was by a vote of 345 to 18, and in the Senate by 61 to 16. The United States was the first country to ratify the agreements. By Dec. 31, 1945, 28 countries had ratified, exceeding the 65 per cent quota required to make the agreement effective. The share of the United States in these deposits is $2,750,000,000 for the Bank and $3,175,000,000 for the Fund, but only a portion of this need be paid at once. The measure provides for a governor of the Fund who serves also as governor of the Bank, an executive director of the Fund, and an executive director of the Bank, all appointed by the President with the consent of the Senate. It also establishes a National Advisory Council on International Monetary and Financial Problems, to coordinate the policies of our representatives on the Bank and Fund with all agencies of our government participating in foreign financial transactions. Membership on this council is *ex officio*. If agreement of the United States is required before action may be taken, the decision is made by the Advisory Council under the general direction of the President. Congress, however, must authorize any change in the United States quota or in the par value of the dollar under the Fund, any subscription to additional shares in the Bank, and any loan to the Bank or Fund. It also amends the Johnson Act by providing that it does not apply to sale or purchase of bonds and other securities of a foreign government in default while the Government is a member of both Bank and Fund.

A companion to the Bretton Woods bill was the expansion of the lending authority of the Export-Import Bank of Washington from $700,000,000 to $3,500,000,000. The objectives of the increase are the maintenance of a high level of employment by providing for foreign trade in the reconversion and post-war periods. The Bank encourages the participation of private capital and makes loans only when private facilities are not available.

INVESTIGATIONS

The year brought as usual many investigations by standing and select committees of Congress. In May official and unofficial missions overseas were so numerous as to create an absentee situation. House officials were reported to have insisted on delay of other trips until important legislative measures could be passed.

In January a special House Committee on the election campaign proposed that Congress set up a permanent agency to police the activities of all political campaign organizations and bring them under scrutiny of the Corrupt Practices Act. So many organizations other than established political parties participated in the 1944 presidential campaign that the special committee was unable to estimate expenditures.

The Committee on Un-American Activities, formerly known as the Dies Committee, was made a standing committee of the House in a surprise move at the beginning of the session.

The Joint Congressional Economy Committee under the chairmanship of Senator Byrd reported on March 22 that, in the three years of its existence, it had effected savings of $2,457,623,568 to the Federal Government through abolition and modification of various agencies and changes in procedure. The committee recommended overall control of government corporations by the General Accounting Office and the Bureau of the Budget. This was later put into effect.

The Ways and Means Committee spent some time studying a decision of the Treasury Department to allow John A. Hartford an income tax deduction of $196,000 written off as a "bad debt" on a $200,000 loan to Elliott Roosevelt, but finally recommended that the Treasury's settlement be allowed to stand. The committee divided on partisan lines and a minority report was filed, opposing the decision.

Seven members of the Colmer Committee of the House spent eight weeks in Europe and conferred with various high officials there. In November the whole committee of 18 members unanimously approved a report urging reorganization of American economic foreign policy with centralization of foreign economic authority in the State Department in a new Under-Secretary for Economic Affairs. It also recommended productive loans to Great Britain with certain conditions as to removal of exchange and import restrictions and loans to Russia if certain statistics and information were produced in full, if her political obligations were fulfilled on the same terms as those of other governments, and if freedom of entry were given to reporters in Russia and the countries under Russian control, with other similar conditions. The committee also recommended immediate relief and short term productive loans in the liberated countries of Europe.

The resignation of Gen. Patrick Hurley as ambassador to China contained charges that State Department subordinates had subverted American foreign policy in China. The Senate Foreign Relations Committee held hearings in which General Hurley, Secretary of State Byrnes, and other witnesses testified and examined secret State Department reports. After a week of these, Senator Connally, Chairman, announced that no further hearings or closed sessions were planned and the matter was apparently dropped.

Some other conspicuous investigations such as those on Pearl Harbor and on the Atom Bomb are noted elsewhere in this article.

LABOR AND SOCIAL SECURITY

Many proposals were made in the fields of Labor and Social Security during 1945, but almost nothing was carried to completion before adjournment. A measure to amend and broaden the Social Security Act to include a national social insurance system covering health, unemployment, disability, retirement, and survivors' insurance and to continue Federal operation of the United States Employment Service was introduced in the Senate in May, but was not passed before the close of the session. The Social Security taxes for 1946 were frozen at the earlier figure of one per cent by the November tax reduction act.

In May President Truman asked that unemployment compensation be increased to a maximum of $25 a week for a 26-week period, that coverage be extended to Federal employees, maritime workers and others not covered, and that the Federal Government pay the benefits to these groups and supplement the state payments for others as an emergency measure. The Senate later passed a compromise measure which would have provided 26-week benefits but at the state-established rates. This was not passed by the House.

The President's request that the United States Employment Service remain under Federal control until June 30, 1947 was rejected by both Senate and House. The service had been taken over from the states in 1942 as a war measure. The order for the return of the service to the states was contained in a rider attached to a bill cutting wartime appropriations by $52,000,000,000. This was vetoed by President Truman on Dec. 23, after Congress had adjourned. The President expressed his disapproval not only of the order returning the service but also of the method used in doing so.

In President Truman's message of Sept. 5 he asked for a "full employment" bill which would provide periodic government gathering of facts about employment and opportunities therefor, would insure a stable and consistent public policy so that private enterprise could better make its plans, and would direct government policies and programs to assure maximum production and employment in private enterprise. He spoke also of the ultimate duty of the Government to use its own resources if all other methods of preventing unemployment failed. The Senate in September passed a somewhat modified bill on the general lines indicated by the President, which made a declaration of policy and provided for a National Production and Employment Budget and a Joint Congressional Committee to study the budget. On Dec. 14 the House passed a greatly altered version of the bill which omitted all reference to "full employment," using instead the phrase "high level of employment," and did not provide for the "Employment Budget." The two measures were sent to conference but not reported on before the close of the session.

An Administration request for labor fact-finding boards to investigate labor disputes affecting the public interest attracted much attention early in December. A bill for this purpose was introduced, and hearings were begun in both Senate and House Labor Committees. The matter proved a highly controversial one, and it was decided to continue the hearings after the holiday.

The House by voice vote in December passed legislation to bring labor unions under the provisions of the 1934 Anti-racketeering Act. The Senate took no action on the bill before adjournment. A rider attached to the December deficiency bill stopped the taking of strike votes by the National Labor Relations Board.

PALESTINE QUESTION

In the final days of the session, both houses passed a resolution asking the Government to use its "good offices" with Great Britain to permit free entry of Jews into Palestine. The resolution was merely an expression of opinion, but there was much discussion in advance as to the advisability of its passage.

PEARL HARBOR

The full investigation of the Pearl Harbor disaster had been postponed on various occasions until the end of the war. In June a bill was passed extending the time for prosecutions until six months after the termination of hostilities. Immediately after Congress reconvened in September there was a demand for such an investigation. A concurrent resolution providing for a joint Congressional committee of ten members passed early in September. This was composed of three Democrats and two Republicans from each house, all lawyers. Counsel for the committee was William D. Mitchell who had complete access to all records and prepared much documentary material which was used during the sessions. Even before the hearings started there was controversy over the right of individual members of the committee to obtain information from government offices without specific committee authorization. It was agreed that they might receive voluntary testimony but could not as individuals demand secret documents. The hearings opened on Nov. 15.

In general, witnesses presented prepared statements and then were questioned by members of the committee, often a lengthy process. The first group of witnesses and sets of documents presented dealt largely with the Washington end of the situation. To the public, perhaps, the most interesting fact disclosed at this time was the breaking of the Japanese code by the United States in 1940. Admiral T. B. Inglis and Col. Bernard Thielen gave accounts of the events in their departments in late November and early December 1941. Admiral Richardson, who was Chief of Staff of the Pacific Command until Feb. 1, 1941, was also called. He was apparently the only witness who had disapproved the basing of the Pacific Fleet at Pearl Harbor.

Former Secretary of State Cordell Hull and former Under Secretary Sumner Welles were questioned extensively on diplomatic relations preceding Pearl Harbor and on the nature of the so-called "ultimatum" to Japan. They were also asked about agreements with other countries, particularly Great Britain, which might have involved this country in war. Some of the questions went back to the Atlantic Charter meetings at which Welles was present. Both denied any such commitments and the existence of any diplomatic intent to provoke war. This was also borne out by Joseph C. Grew, former ambassador to Japan. Next Major-General Sherman Miles and General Leonard T. Gerow testified in regard to the data sent to General Short and other commanders, and the factors in its selection.

General Marshall appeared before the committee for several days and was subjected to most detailed questioning about the warnings sent and the means of communication used. In connection with his testimony, the committee made public in full his two letters to Governor Dewey of New York at the time of the 1944 campaign in which he urged the Governor not to press the Pearl Harbor issue lest the breaking of the codes become known to the Japanese. Following General Marshall, Admiral T. S. Wilkinson and Admiral Richard K. Turner were questioned as to the division of responsibility for orders in the Navy and the sending of information to the fleet commanders.

It had been originally intended that the hearings should end early in January but the questioning of the witnesses had become very detailed and much time was consumed. By Dec. 13, 700,000 words of testimony had been gathered. On Dec. 14, Counselor Mitchell announced that he and his staff were resigning soon since it was apparent that the hearings would not be ended by the time expected. Even Senator Barkley, chairman of the committee, thought that his other duties might compel his withdrawal. Congress, before adjournment, authorized continuance of the investigation to Feb. 15, 1946. The committee then recessed from Dec. 21 to Dec. 31.

After the recess, Admiral Stark was questioned for five days and gave detailed reports as to the contents and purposes of the messages he sent just prior to the Pearl Harbor disaster. At this time, a hitherto secret report of the late Secretary of the Navy, Frank Knox, was released, which gave his views after investigation. The committee then recessed until Jan. 15, 1946, to give its new counsel, Seth W. Richardson, time to become familiar with the testimony and records. The point was regarded as concluding the Washington phase of the investigation. It was fairly clear that, though there was fear of a Japanese attack, most of the witnesses had thought it would be to the South and not directed at Pearl Harbor. It was not clear whether the warnings from Washington had been adequate and not properly heeded or whether the field commanders had lacked important information. The men in the field were heard next. Admiral Husband E. Kimmel discussed the withholding of the "intercepts" and the interpretation of orders. He was followed by Major General Walter C. Short. Several other major witnesses remained to be heard, but it was hoped that the investigation could be ended by Feb. 15.

POST OFFICE

A measure was passed continuing the temporary increase in postal rates on first class matter until June 30, 1947. In July a bill provided for reclassifying postmasters, officers, and employees of the Post Office Department and established a uniform procedure for recalculating compensation. In December the Department was authorized to give cash awards to its employees for ideas that would improve the postal service. Total payments for this were limited to $25,000 in any one year.

PRICE CONTROL

The office of Price Administration was continued until June 30, 1946. Action was completed on the bill less than ten hours before the old law would have expired. The bill covered both the Emergency Price Control Act and the Stabilization Act of 1942. Under this act the OPA is required to obtain the approval of the Secretary of Agriculture in setting prices applying to processors but not to retail stores. All slaughtering limitations were lifted on plants found to be sanitary by the Secretary of Agriculture. There was also a section added establishing rent advisory councils to be consulted before issuance of regulations in the field.

PUBLIC WORKS

A Rivers and Harbors bill was passed in February, authorizing post-war construction of navigation, irrigation, and hydroelectric works costing nearly $500,000,000. The Missouri Valley Authority and other controversial projects which had caused postponement of a similar act in 1944 were omitted. In October the President asked for revival of the public works program as a part of reconversion and requested a special appropriation for projects interrupted by the war. These included flood control, highways, and the dams called for in the Mexican water treaty. Much debate took place over some items of this sort, notably the Garrison Reservoir in North Dakota. The final deficiency bill of the session contained an appropriation of $125,000,000 for navigation and flood control.

RECIPROCAL TRADE AGREEMENTS

President Roosevelt in March sent a message to Congress asking for renewal of the Trade Agreements Act, praising the results of the act and stressing its importance in the reconversion period. Two months later President Truman appealed for passage of the bill. As passed, the act was extended to June 12, 1948. The President was given the power to reduce tariffs by 50 per cent from present rates to countries which made reciprocal concessions. This was a gain over the earlier version of the act in which the tariff rates of 1930 were the basis for reductions. The use of Jan. 1, 1945, as the base, makes possible new reductions.

GOVERNMENT REORGANIZATION

The entire problem of reorganization of Federal agencies was recognized as a serious one because of the numerous war agencies and the need for rearrangement of the permanent agencies. One step in that direction was taken by a bill which required government corporations to submit their budgetary problems to the Bureau of the Budget and their expenditures to the General Accounting Office for audit. This measure was advocated by the Congressional Economy Committee. There are nearly 50 corporations, with assets estimated at $20,000,000,000. The Tennessee Valley Authority alone handles its funds as before.

In May, President Truman asked for legislation giving the President permanent authority to reorganize the executive branch of the Government. He felt that continuous revision was necessary to keep the government structure from becoming unwieldy, and suggested a measure similar to the Reorganization Act of 1939. Congressional action on a reorganization measure was completed on Dec. 14 and the bill signed Dec. 19. The powers of the bill are limited to the current presidential term. Any recommendations which the President makes become law within 60 days unless both Senate and House disagree. No readjustment of cabinet departments is permitted. The civil functions of the Army Engineers Corps are wholly exempted from reorganization. The Interstate Commerce Commission, Federal Trade Commission, National Mediation Board, National Railroad Adjustment Board, and Railroad Retirement Board are exempt from reorganization, but functions may be transferred to them. In the cases of the Federal Deposit Insurance Corporation, the Federal Communications Commission, United States Tariff Commission, and Veterans' Administration, separate plans must be submitted if changes are to be made.

SUBSIDIES

The Reconstruction Finance Corporation was given continued authority to pay subsidies for one year for food products and strategic materials. These were limited to $595,000,000 to meat producers, $100,000,000 for butter, $190,000,000 for flour, $290,000,000 for petroleum and petroleum products, $88,000,000 for strategic metals, and $100,000,000 for miscellaneous commodities. In signing the bill President Truman announced that he considered it as permitting administrative reductions or the elimination of subsidies whenever it might be shown that such payments were no longer needed.

The Commodity Credit Corporation was continued until June 30, 1947 and its borrowing power increased to $4,750,000,000. Limited subsidies were permitted to complete prior operations. The sum of $568,000,000 was allowed for subsidies on dairy products for the year ending June 30, 1946, and $120,000,000 for non-crop programs, such as feed-wheat, for the same time. Subsidies of $225,000,000 were also permitted for the 1945 crop. This was the last law approved by Franklin D. Roosevelt.

PRESIDENTIAL SUCCESSION

President Truman asked for a change in the order of succession to the presidency. He felt it wrong that it should lie within his power to name his possible successor and suggested legislation naming the Speaker of the House successor until a special election could be held. The House passed a measure providing for the succession of the Speaker in the event of a vacancy, but made no provision for a special election. The Senate took no action on the bill.

TAXES

In July a corporate tax adjustment bill was passed, estimated to free $5,500,000,000 for reconversion and post-war expansion. The measure increased the specific excess profits tax exemption from $10,000 to $25,000 after Jan. 1, 1946, a change estimated to free 12,000 corporations from the tax entirely and lighten the burden for many others. It also provided that post-war refund bonds would be payable at the option of the owner on or after Jan. 1, 1946. The measure made possible the use of the post-war credit of 10 per cent of the excess profits tax currently with respect to tax liabilities of 1944 and subsequent years. The payment of refunds resulting from carry-backs of net operating losses was speeded up, as was the payment of refunds from the recomputation of deductions for amortization of emergency facilities.

In November a tax reduction bill gave the first general reduction in 16 years. It became effective Jan. 1, 1946, for 1946 income, but was not retroactive. All taxpayers received some reduction, those with incomes under $50,000 receiving ten per cent or more, and 12,000,000 low income taxpayers were removed from the tax rolls entirely. The individual surtax exemptions of $500 for the taxpayer and $500 for each dependent were applied to the normal tax. Cuts were also made on the surtax. For corporations the excess profits tax was repealed as of Dec. 1, 1945, and slight reductions were also made for normal and surtax corporation rates for 1946. The $5 a year automobile use tax was repealed as of June 30, 1946. Service pay of enlisted personnel was exempted from any tax during the war years, and commissioned officers were given three years to pay any back taxes on their service pay. Social Security rates for employer and employee remained at one per cent each for 1946 instead of increasing automatically to two and one half per cent. The measure was estimated to cut revenue by $5,920,000,000.

TREATIES

The major treaty ratification of the year was that of the Charter of the United Nations Organization which is discussed elsewhere. Early in the year President Roosevelt asked the Senate to return to him the Anglo-American petroleum agreement of Aug. 8, 1944, since he felt that a new draft was needed because of diverse interpretations of its language, both here and abroad. In April the Senate ratified the United States-Mexico Water Distribution Treaty by 76 to 10.

The House voted 288 to 88 to participate with the Senate in the approval of treaties through decisions made by a majority of the membership of each branch of Congress. This would, of course, require a constitutional amendment. The measure was sent to the Senate, but it was not acted upon there.

UNITED NATIONS FOOD AND AGRICULTURAL ORGANIZATION

Membership in the United Nations Food and Agricultural Organization was accepted by the House on April 30 and the Senate on July 21, and signed by the President ten days later. This organization developed from the Hot Springs Conference of 1943. Member nations are required to make periodic reports on food and agriculture and to contribute to the Organization's financial support. The sum of $625,000 was authorized as the United States' share in expenses for the first year.

UNITED NATIONS ORGANIZATION

Some of the most important legislation of the year was that dealing with the membership of the United States in the United Nations Organization. The Charter of the UNO was signed in San Francisco on June 26. Two days later Senator Connally reported to the Senate on the conference at San Francisco, as did Senator Vandenberg on July 29. Both urged prompt ratification of the Charter. The Charter was formally presented to the Senate by President Truman on July 2 with an appeal for speedy action. The Foreign Relations Committee devoted a week to hearings at which Secretary of State Stettinius and other members of the State Department testified. Three days were given to testimony and written statements from anyone who wished to be heard. On July 16 the committee reported in favor of adopting the Charter without amendment.

The Charter was ratified 89 to 2 on July 28. This made the United States a member of the UNO, whenever a sufficient number of other countries should ratify the charter, but left several problems such as that of the powers of our delegate on the Security Council to be determined later by action of both Houses of Congress. It was understood, at least by Administration forces, that any military agreements implementing the Charter should also be passed in this way and not as treaties by a two-thirds vote in the Senate.

Action on the bill to implement participation in the UNO was completed in the last week of the session. This provides for presidential naming of an American representative on the Security Council with ambassadorial rank and a deputy for this post, for representatives to the General Assembly and to other UNO organs and agencies. These posts require Senate confirmation except in cases in which the appointees already hold Federal offices with Senate consent. Government officials may serve as delegates without extra pay. The President is to make annual or more frequent reports to Congress on the activities of the UNO and participation in them by the United States. He is empowered to use economic sanctions and other measures short of war without first consulting Congress. Negotiation of agreements with the Security Council to make armed forces available for emergency use is performed by the President with approval by act of Congress. The measures passed the Senate 65 to 7 and the House 344 to 15.

UNRRA

The United Nations Relief and Rehabilitation Administration was the subject of much legislative discussion during the year and eventually received the support asked. A House committee made a study of conditions during the summer. In his fourth report on UNRRA, on Oct. 11, President Truman revealed that about $780,000,000 of the United States' appropriation of $800,000,000 was committed by Aug. 31. The State Department at the same time urged prompt appropriation of $550,000,000 more already authorized for immediate use. This was voted by the House on Nov. 1 and by the Senate some weeks later. A rider attached to the bill providing that relief be withheld from countries which denied freedom of the press to American reporters was rejected in conference. The bill did request the President to seek permission for

American newspaper and radio men to go into countries aided by UNRRA.

An authorization bill to furnish a second $1,350,000,000 for UNRRA for relief in 1946 and 1947 passed both houses toward the end of the session. There was much discussion of UNRRA policies and methods during the debates on the measure. As passed, it specified that UNRRA shipments to Europe should end in 1946 and those to the Far East by March, 1947. It was made quite clear that Congress regarded this as the last authorization for UNRRA. The sum of $750,000,000 was appropriated for use in 1946 in a general deficiency appropriation.

VETERANS

Increased benefits for veterans were the subject of much discussion. General pension increases were provided for seriously injured veterans of all wars, especially the blind and those with multiple amputations. The maximum pension was increased from $265 to $300 a month, and the veterans' administrator was authorized to allow more than $300 a month to veterans with unusual combinations of disabilities.

The "GI Bill of Rights" was amended to give increased educational benefits and liberalized rules on loans. Student subsistence payments were increased $15 a month, and the clause deducting benefits under the bill from any future bonus was deleted. The 25-year age limit was removed. Any veteran may receive a year's training, plus as many years as he was in service, with a maximum of four years. Short intensive courses and recognized correspondence courses are approved, but the cost may not exceed $500. Other modifications were concerned with time of starting and completing school courses. The time for making guaranteed loans is extended from two to ten years after the war. Extensions are also made in the amortization period. The term "reasonable value" is substituted for "reasonable normal value" as a loan requirement.

Prior approval of loans by recognized lenders is no longer required. Loans in such cases are automatically guaranteed after a veterans' administration appraisal shows the property to be reasonably priced. The maximum guarantee on real estate is increased from $2,000 to $4,000, and other provisions are broadened. Americans who fought for allied governments became eligible for GI loan benefits.

In another measure, red tape was cut for entry in the United States for wives of servicemen married overseas and for their children.

The final deficiency appropriation made about $190,000,000 available for veterans' housing. This was to be used to transfer temporary dwelling units from former war areas to communities lacking adequate facilities for veterans. It operates as a part of the Lanham Housing Act.

WAR POWERS

There was discussion as to the advisability of declaring the war officially at an end and as to the continuation of the President's war powers. No action was taken on the first issue. On Dec. 20 legislative action was completed on a measure extending the wartime rationing, material allocation, and priority powers of the President until July 1, 1946, as well as most of the other powers which he held under the second War Powers Act. The measure also continued the emergency powers of the Inter-State Commerce Commission over motor and water carriers and the authority of the War and Navy Departments to occupy property before condemnation although actual seizure was no longer permissible. The authority of the Federal Reserve Bank to purchase obligations up to $5,000,000,000 directly from the Treasury instead of going to the open market was continued. Of immediate interest was a provision in the act waiving navigation laws to allow overloading of ships until troops are returned from overseas. Administration forces had hoped to extend the war powers until Jan. 1, 1947, but this was rejected.

WAR PRODUCTION AND RECONVERSION

The life of the Smaller War Plants Corporation was extended to Dec. 31, 1946, but the original measure was amended to have the directors appointed by the President rather than by the chairman of the War Production Board.

The termination date for renegotiation of war contracts was extended to Dec. 31, 1945, with a provision for earlier termination if the war should be officially declared ended before that date. The President's former power to change the date was withdrawn. Repricing provisions for war contracts were also to terminate at the same time.

In September, following an administrative request, surplus war property disposal was placed under a single administrator with a two-year term and an annual salary of $12,000. The administrator replaces the former Surplus Property Board.

The nation was returned to standard time by a measure which ended wartime as of Sept. 30, 1945.

THE SUPREME COURT AND CONSTITUTIONAL LAW

By Robert E. Cushman
Professor, Cornell University

GENERAL

In July Mr. Justice Owen J. Roberts resigned the seat on the Supreme Court to which President Hoover had appointed him in 1930. To fill this vacancy, President Truman in September appointed Harold H. Burton, a Republican Senator from Ohio, who took his seat at the opening of the October term. In May, President Truman appointed Mr. Justice Jackson to be the Chief American prosecutor at the pending trial of Axis war criminals at Nuremberg. His absence during the fall and early winter led the Court to assign for reargument "before a full bench" several important cases in which, it may be assumed, the eight sitting justices had been evenly divided. This has led to serious discussion of whether any Federal judge should be allowed to accept a non-judicial assignment which would interfere with his judicial duties. Divisions in the Court in 1945 were as numerous and as difficult to classify as before. Four justices dissented in 24 cases, and three justices in 16 cases. The Court seems to be moving toward the old practice of the pre-Marshall period by which the justices wrote *seriatim* opinions. There is marked increase, unfortunately, in the number of cases in which three, four, and even five justices feel impelled to write separate opinions.

TREND AND GROUPING

The decisions of the Court fell into groups. First, an important case arising from the war brought to the Court for the first time the question of what is treason under the Constitution. Second, a group of cases involving civil liberties dealt with the deportation of Harry Bridges, the power of Congress to punish state officers for brutality to prisoners, the right of a state to bar a conscientious objector from the practice of law, the right of accused persons to counsel, and two problems of discrimination against Negroes. Third, several cases involved the validity of recent state laws directed against labor unions and their activities. Fourth, cases which arose under the Sherman Act included the much-publicized Associated Press case, and two cases involving the applicability of the act to labor union activities. Finally, the Court added an important sequel to its decision of three years ago on the out-of-state recognition which must be given to Nevada divorces.

TREASON

In *Cramer v. United States* (April 23), the Supreme Court for the first time in its history reviewed a conviction for the crime of treason, and in so doing analyzed the nature of treason and the kind and measure of evidence required to prove it. The prosecution of Cramer resulted from his association with two of the German saboteurs who landed in this country in 1942 and whose trial by a military commission was sustained by the Court in *Ex parte Quirin* (317 U. S. 1, 1942). Cramer was born in Germany, served in the German Army in 1918, came to this country in 1925, and was naturalized in 1936. He appears to have been a quiet, intelligent, and law-abiding person. He was at one time a member of the Friends of New Germany, a predecessor of the German-American Bund, but withdrew before it became the Bund. He retained a strong affection for Germany. Before Pearl Harbor he opposed our entrance into war with Germany. He refused to work on war materials and expressed concern over the possibility of being drafted into our army and "misused" for purposes of "world conquest." There is no evidence, apart from the acts charged against him in this case, that Cramer said or did anything disloyal to this country after we entered the war.

Cramer was a close friend of Werner Thiel, later one of the German saboteurs, and lived with him in New York from 1937 to 1941, at which time Thiel, an ardent Nazi, returned to Germany. Cramer corresponded with Thiel in Germany. On June 17, 1942, Thiel, as a member of a group of four saboteurs led by Edward Kerling, landed from a German submarine near Jacksonville, Fla. Thiel and Kerling came to New York and registered at a hotel under assumed names. The next day a note was slipped under Cramer's door urging him to meet "Franz from Chicago" at a specified time and place. Cramer said he knew no Franz, but kept the appointment and met Thiel. Cramer admitted that he knew Thiel had come from Germany. He asked him if he had been brought by German submarine, and Thiel answered evasively. Thiel said he had "three and a half or four thousand dollars" with him, and that "if you have the right kind of connections you can even get dollars in Germany." Cramer offered to keep Thiel's money for him but nothing was done about it that evening. They agreed to meet at a tavern the next evening, and on that occasion Kerling joined them for awhile. Cramer had known Kerling in this country and knew he had returned to Germany. Thiel entrusted his money to Cramer for safekeeping, but asked him not to put all of it in a safe-deposit box since he might need it "in a hurry." Thiel was arrested after leaving Cramer. Cramer took Thiel's money home, secreted some of it, and put the rest in his bank. As previously agreed upon, he made contact with Thiel's fiancée, told her that Thiel had come over on a submarine, had a large sum of money, and would receive secret instructions about what to do and where to go. He later wrote Thiel, using the latter's assumed name, and tried to arrange a rendezvous between Thiel and the girl. Cramer was arrested and after some unsuccessful lying he admitted that he felt sure that Thiel had come from Germany by submarine on a mission for the German Government and that he thought the mission was "to stir up unrest among the people and probably spread propaganda."

After the case had been twice argued, the Court, dividing five-to-four, held that the facts just stated do not constitute sufficient proof of the crime of treason as defined by the Constitution. Mr. Justice Jackson wrote the majority opinion. The Constitution states: "Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court." The history of the law of treason in England and in this country shows that this rigidly limited provision in the Constitution was put there by men who "were taught by experience and by history to fear abuse of the treason charge almost as much as they feared treason itself." They were guarding against two dangers "(1) perversion by established authority to repress peaceful political opposition; and (2) conviction of the innocent as a result of perjury, passion, or inadequate evidence." A treason conviction, in short, must rest on two elements, treasonable intent, and overt acts in pursuance of that intent proved by the evidence of two witnesses. The Court made the following points: *First,* the treasonable intent, or "adherence to the enemy," necessary to spell out treason, need not be proved by the evidence of two witnesses. It may be reasonably inferred from overt acts, and certain kinds of overt acts are in themselves evidence of treasonable intent. *Second,* the overt acts necessary to the crime of treason must, however, be such as to sustain a finding that the accused gave aid and comfort to the enemy. *Third,* the overt acts charged against Cramer, and supported by two-witness proof comprised merely his meeting with Thiel and Kerling at the times and places above stated, their drinking together, and their holding long and earnest conversations. There was no evidence of what they talked about. "Cramer furnished them no shelter, nothing that can be called sustenance or support, and there is no evidence that he gave them encouragement or counsel, or even paid for their drinks." These overt acts do not amount to giving aid and comfort to the enemy. The contention of government counsel that "little imagination is required to perceive the advantage such meeting would afford to enemy spies not yet detected" is met by Mr. Justice Jackson's comment that "the difficulty with this argument is that the whole purpose of the constitutional provision is to make sure that treason conviction shall rest on direct proof of two witnesses and not on even a little imagination." *Fourth,* the Government did not present to the jury the overt acts attributed to Cramer in connection with his taking of Thiel's money for safe-keeping. Knowledge of this came exclusively from Cramer's own statements while on the stand, and the Government appears to have recognized either that the statement could not be regarded as "a confession in open court" or that the statement lacked two-witness proof. Had these overt acts been properly established the result might have been very different since they did give aid and comfort to the enemy. *Fifth,* the Court answered the charge that its rigid construction of the treason clause prevents the Government "from adequately combating the techniques of modern warfare," by stating that Congress has full power to forbid many acts short of treason which imperil our wartime safety, and implied strongly that other and lesser charges might perhaps have been made and sustained against Cramer.

Mr. Justice Douglas wrote a dissenting opinion in which the Chief Justice and Justices Black and Reed concurred. He attacked what he regarded as the ultra-rigid test applied by the Court to the nature of the overt acts necessary to spell out treason, and urged that Cramer's meeting with the two saboteurs was under the circumstances an overt act of treason. He also protested against the exclusion of the evidence given by Cramer relating to his voluntary safeguarding of the saboteur's money.

DEPORTATION OF HARRY BRIDGES

In *Bridges v. Wixon* (June 18) a divided court set aside as unlawful the deportation order against Harry Bridges. While the decision did not turn on a constitutional point, this case, which had been a *cause celèbre* for a decade, intimately concerns the civil liberties of aliens. The facts are as follows: Harry Bridges came to this country from Australia in 1920. He was a longshoreman, and he became active in the labor union movement on the West Coast. He became head of the International Longshoremen's Association (an A. F. of L. union) and led the maritime workers' strike on the Pacific Coast in 1934. In 1937 this union broke with the A. F. of L. and joined the C. I. O. under the new name of International Longshoremen and Warehousemen's Union. Bridges has been the head of this union on the Pacific Coast ever since, and holds important offices in the C. I. O. In 1934 and 1935, the Immigration and Naturalization Services investigated Bridges with a view to determining if he was liable to deportation, but found not even "a shred of evidence" to support such action.

In 1938 fresh deportation proceedings were started on the ground that Bridges had been and then was a member of or affiliated with the Communist Party of the United States, and that that party advocated and taught the overthrow by force of the Government of the United States. At that time the statute dealing with deportation as construed in *Kessler v. Strecker* (307 U. S. 22, 1939), required a showing of present membership in the Communist Party to support deportation. Past membership was not sufficient. A hearing was held before Dean James M. Landis, of the Harvard Law School, as special examiner, who concluded that the evidence showed that Bridges was neither affiliated with nor a member of the Communist Party. The Secretary of Labor sustained the examiner and dismissed the proceedings in January, 1940.

Resentment against Bridges in certain quarters was sufficient to lead the House of Representatives thereupon to pass a special bill directing the Attorney General "notwithstanding any other provisions of law" immediately to deport Bridges, "whose presence in this country the Congress deems hurtful" (H. R. 9766, 76th Cong. 3d Sess.). The Attorney General protested that this bill was inconsistent with the American practice and tradition of due process of law, and it died in a Senate committee. Congress, however, in passing the Alien Registration Act of June 28, 1940, amended the statute relating to the deportation of aliens by authorizing the deportation of any alien who was "at the time of entering the United States, or has been at any time thereafter," a member of or affiliated with an organization that believes in or advocates the overthrow by force or violence of the Government of the United States.

This amendment set aside the ruling in *Kessler v. Strecker*. Action to deport Bridges was started under the new statute on the ground that at an earlier date he had been a member of or affiliated with the Communist Party. A new hearing was held before a special examiner, Judge Charles B. Sears, recently retired from the New York Court of Appeals. Judge Sears found that the Communist Party did advocate the overthrow of government by force and violence, that the Marine Workers Industrial Union was affiliated with the Communist Party and was an organization of the same character, and that Bridges after entering this country had been affiliated with both organizations and had been a member of the Communist Party. He recommended deportation. The Board of Immigration Appeals reviewed these findings and concluded that Bridges had not been affiliated with or a member of either organization. The Attorney General reviewed the Board's decision, agreed with Judge Sears, and ordered Bridges to be deported. Bridges, having surrendered to the immigration officers, attacked the legality of his detention by seeking *habeas corpus*. The District Court, and later the Circuit Court of Appeals, sustained the deportation order and the Supreme Court took the case on certiorari.

In a five-to-three decision, Mr. Justice Jackson not participating, the Court held the deportation order against Bridges void. In his opinion for the majority, Mr. Justice Douglas, by-passing the constitutional questions urged on the Court, confined himself to the two grounds on which the deportation order rested. The first was that Bridges had been "affiliated" with the Communist Party. The deportation statute stated that "the giving, loaning or promising of money or any thing of value to any organization, association, society, or group of the character above described (advocating or teaching violent overthrow of government) shall constitute affiliation therewith," but it went on to state that this is not to be taken as "an exclusive definition." The Court proceeded therefore to expound the term "affiliation." It said that "it imports . . . less than membership but more than sympathy." Generally speaking, a man who worked with and helped finance the Communist Party would be affiliated with it, but here the Court injected a reservation of controlling importance, *i.e.*, "but he who cooperates with such an organization only in its *wholly lawful activities* can not by that fact be said as a matter of law to be 'affiliated' with it. . . . Alliances for limited objectives are well-known. Certainly those who joined forces with Russia to defeat the Nazis may not be said to have made an alliance to spread the cause of Communism . . . A different result is not necessarily indicated if aid is given to or received from a proscribed organization in order to win a legitimate objective in a domestic controversy."

It follows that one is "affiliated" with the Communist Party only if he cooperates with it in order to further its proscribed purposes and objectives. The record presents no evidence that Bridges was "affiliated" in this restricted sense with the Communist Party, or any other organization which advocated the overthrow of government by force or violence. He cooperated with various Communist groups "for the attainment of wholly lawful objectives." He accepted the aid and assistance of these revolutionary groups "to improve the lot of the workingmen on the waterfront. That he enlisted such aid is not denied. He justified that course on the grounds of expediency—to get such help as he could to aid the cause of his union." The finding that Bridges was "affiliated" with the Communistic groups was based, therefore, on too loose a meaning of the term.

The second ground for deportation was Bridges' alleged membership in the Communist Party. The evidence supporting this charge was the testimony of two government witnesses, O'Niel and Lundeberg, which was lumped together by the Attorney General in reaching his conclusion based on their "total weight," that Bridges had in fact joined the Party. The testimony of O'Niel, however, was in the form of unsworn and unsigned statements which were read into the record in violation of a regulation of the Immigration and Naturalization Service requiring all such statements to be taken down in writing and signed by the witness after he has been sworn. This procedural defect destroyed the Government's case on the question of Bridges' membership in the Communist Party. The Court recognized "that deportation is not technically a criminal proceeding," but it observed: "That deportation is a penalty—at times a most serious one—cannot be doubted. Meticulous care must be exercised lest the procedure by which he (the alien) is deprived of that liberty (to remain here) not meet the essential standards of fairness."

In a concurring opinion Mr. Justice Murphy asserted that "the Constitution has been more than a silent, anemic witness to this proceeding," and vigorously argued that the deportation statute is unconstitutional, first, because it denies due process by imposing punishment based on "guilt by association" rather than personal guilt, and secondly, because it does not meet the "clear and present danger" test applicable to freedom of speech and press.

Chief Justice Stone, with Justices Roberts and Frankfurter concurring, dissented on the ground that the Court was not authorized to determine the weight and credibility of the evidence against Bridges, but merely to decide whether there was "more than a scintilla" of evidence to support the findings of the administrative officers. The record clearly disclosed such evidence, and the deportation order was therefore valid.

FEDERAL PROTECTION OF CIVIL LIBERTY—THE POLICE BRUTALITY CASE

The case of *Screws v. United States* (May 7) involved the legality of an enterprising effort by the Department of Justice to extend the practical frontiers of the Federal protection of civil rights by prosecuting state police officers whose brutal treatment of a Negro prisoner resulted in his death. The facts of the case are gruesome in the extreme. Screws was sheriff in a county in Georgia. Aided by a deputy sheriff and a policeman, he arrested Hall, a Negro, late one night for the alleged theft of a tire. There was evidence that Screws held a grudge against Hall and had threatened to "get" him. The three officers handcuffed Hall, brought him to the courthouse, and there proceeded to beat him with their fists and a two-pound blackjack for from 15 to 30 minutes until he was unconscious. He was dragged by the feet into the jail and thrown onto the floor and died an hour later in a hospital. An unsuccessful effort was made to persuade the State of Georgia to prosecute the three officers. When this failed, the United States Attorney, with the approval and active aid of the Department of Justice (the Civil Rights Section), indicted and convicted Screws and the other two officers of violation of Section 20 of the Federal Criminal Code.

This section, part of the Enforcement Act of May 31, 1870, reads as follows: "Whoever, under color of any law, statute, ordinance, regulation, or custom, willfully subjects, or causes to be subjected, any inhabitant of any State, Territory, or District to the deprivation of any rights, privileges, or immunities secured or protected by the Constitution and laws of the United States, or to different punishments, pains, or penalties, on account of such inhabitant being an alien, or by reason of his color, or race, than are prescribed for the punishment of citizens, shall be fined not more than $1,000, or imprisoned not more than one year, or both." The indictment rested on the theory that the three officers had deprived Hall, under color of the law of Georgia, of rights guaranteed to him by the Fourteenth Amendment, namely "the right not to be deprived of life without due process of law; the right to be tried, upon the charge on which he was arrested, by due process of law and if found guilty to be punished in accordance with the laws of Georgia."

The Court's disposition of the case is a masterpiece of confusion. Having held the case seven months after hearing argument, the justices produced four separate opinions running to over 25,000 words, in no one of which, however, did more than four justices concur. Five justices did agree that Screws was entitled to a new trial because the trial judge did not correctly charge the jury. (This trial has since occurred, and the defendants were acquitted.) The leading opinion, written by Mr. Justice Douglas, dealt with three points. First, is the criminal charge here, that of violating the rights of a citizen which are protected in the Fourteenth Amendment, so vague as to violate due process of law. It was argued that Section 20 did not set up "an ascertainable standard of guilt." Can a state law-enforcement officer possibly know what rights are guaranteed to citizens by the Fourteenth Amendment and other clauses of the Constitution? This point is met by stressing the fact that the crime created by Section 20 is the "willful" deprivation of the citizen's rights, and Mr. Justice Douglas attempts, without conspicuous success, to make clear just what is meant by "willful" in this context. Since the trial judge did not charge the jury on this point of the willfulness of the defendants' action, the conviction is set aside and a new trial ordered. Second, it is held that Screws did act under "color of law" in committing this crime. The idea is rejected that an officer acts "under color of law" only when performing duties expressly authorized by statute. The term means "under pretense of law," and the doctrine stated in *United States v. Classic* (313 U. S. 299, 1941) is reaffirmed, "misuse of power, possessed by virtue of state law and made possible only because the wrongdoer is clothed with the authority of state law, is action taken 'under color of' state law." Third, while the responsibility for the enforcement of criminal justice rests chiefly with the state, there is no constitutional barrier which prevents Congress from punishing a state officer who deprives a person of a right secured to him by the Constitution or by Federal statute. To do so does not upset the proper balance between state and Federal power.

Mr. Justice Rutledge concurred with the Douglas opinion in order to permit a disposition of the case by a majority of the Court, although he stated that, but for this reason, he would have gone along with Mr. Justice Murphy in upholding the conviction of Screws. Mr. Justice Murphy in a short and clear-cut opinion urged that Section 20 clearly applies to this case, and that Screws was properly convicted. A dissenting opinion states the views of Justices Roberts, Frankfurter, and Jackson. It takes sharp issue with the Douglas opinion on each of the three points referred to above and concludes that the conviction should have been set aside.

While the Screws case leaves intact a certain quantum of Federal power to proceed against state officials under Section 20 of the Criminal Code. the Department of Justice will hardly be able to proceed with confidence and vigor in the prosecution of future cases of this type in view of the confusion and uncertainty which characterize the Court's disposition of the case.

STATE EXCLUSION OF CONSCIENTIOUS OBJECTOR FROM THE PRACTICE OF LAW

The Court's almost unbroken support of freedom of conscience in recent cases is withheld in *Re Summers* (June 11) which sustained the right of Illinois to exclude a conscientious objector from admission to the bar. The law examiners of Illinois did not dispute Summers' general good character or professional fitness. They excluded him solely because his religious scruples against bearing arms "seem inconsistent with the obligation of an attorney at law." The precise ground of this ruling was that Summers could not in good faith take the oath which is required of Illinois lawyers to support the state constitution. This, in turn, was based on the fact that the Illinois constitution contains the clause: "The militia of the state of Illinois shall consist of all able-bodied male persons resident in the state, between the ages of eighteen and forty-five, except such persons as now are, or hereafter may be, exempted by the laws of the United States, or of this State." Summers was willing to take the required oath, but was not permitted to do so. Men have not been drafted into the Illinois militia since 1864 and no one suggested that such action in the future is probable. Thus Summers' status was roughly similar to that of Mrs. Schwimmer, a woman of 50, who was denied citizenship in 1929 (*United States v. Schwimmer,* 279 U. S. 644) because she would not because of conscientious scruples take an oath to bear arms in defense of the United States.

Five justices, speaking through Mr. Justice Reed, held that Summers had not been denied due process of law by any state infringement of the freedom of religion protected by the First Amendment. The opinion granted that the state could not exclude the members of a particular religious sect as such from admission to the bar, but denied that there is such religious discrimination here. It alluded to the fact that such immunities as conscientious objectors enjoy under the Selective Training and Service Act stem from Congressional generosity rather than from constitutional right. Finally, the Court relied upon the *Schwimmer* case and the parallel *Macintosh* case (*United States v. Macin-*

tosh, 283 U. S. 605, 1931), in which conscientious objectors were denied citizenship, as fully supporting the Illinois action here. A vigorous dissent by Mr. Justice Black, with whom Justices Douglas, Murphy, and Rutledge concurred, attacked the exclusion of Summers as a direct assault upon his freedom of religion, and expressed firm agreement with the views of the dissenting justices in the *Schwimmer* and *Macintosh* cases.

THE RIGHT OF ACCUSED PERSONS TO COUNSEL

That the right of an accused person to be represented by counsel remains an important ingredient of due process of law was emphasized in four cases. Three of these were cases in which the accused pleaded guilty. In *Williams v. Kaiser* (Jan. 8, 1945) conviction for a capital crime resulted from the defendant's plea of guilty entered after he had requested and had been refused the aid of counsel. He alleged that he was without funds to employ counsel, and after the court's failure to provide him with counsel he was "compelled to plead guilty." While granting that a conviction based on a plea of guilty ought not lightly to be set aside, the Court emphasized that in a capital case the situation is different. "Only counsel could discern from the facts whether a plea of not guilty to the offense charged or a plea of guilty to a lesser offense would be appropriate." Refusal of counsel in such a case denies due process. A similar result was reached in *House v. Mayo* (Feb. 5) in which the accused pleaded guilty to a burglary charge after being refused by the Court a 24-hour delay in his trial to permit him to consult his attorney who was away. In *Rice v. Olson* (April 23) it was held that the accused who had pleaded guilty to a charge of burglary did not waive his right to counsel at the time of entering his plea because, through ignorance, he did not ask to have counsel assigned, and the court did not inform him of his constitutional rights in the matter. A conviction for murder was set aside in *Hawk v. Olson* (Nov. 13) in which the record showed that the accused had been given no opportunity to consult counsel before the calling of the jury.

DISCRIMINATION AGAINST NEGROES

Akins v. Texas (June 4) held that a Negro was not denied the equal protection of the laws through racial discrimination by being indicted for murder by a grand jury on which only one Negro served. The Court has repeatedly held that a Negro is constitutionally entitled to be indicted and tried by juries from which Negroes have not been excluded because of their race. It has further held that the failure of a community over a long period of time ever to call Negroes for jury service, although there are qualified Negroes available for such service, is evidence of such discrimination. In 1942 the Court set aside the conviction of a Negro in a Texas county because it found he had been the victim of just this kind of racial discrimination. See *Hill v. Texas* (316 U. S. 400). The following year Akins was indicted in this county, and the jury commissioners were careful to see that one Negro was on the panel of 16 from which the grand jury of 12 was drawn, and this Negro also served on the grand jury which indicted Akins. Each of the three jury commissioners stated candidly: "I did not have any intention of placing more than one Negro on the panel." Do these facts spell racial discrimination? The Court held not. It failed to find "purposeful" discrimination. "The mere fact of inequality, in the number selected does not in itself show discrimination. No race or group is entitled to proportional representation in the makeup of juries. In this particular county 15 per cent of the population were Negroes, and on a strict mathematical computation they would be entitled to 1.8552 Negro members on a jury of 12. The presence of only one Negro, therefore, does not prove racial discrimination.

Chief Justice Stone and Mr. Justice Black dissented. Mr. Justice Murphy wrote a sharp dissent declaring:

"Clearer proof of intentional and deliberate limitation on the basis of color would be difficult to produce."

In *Railway Mail Association v. Corsi* (June 18) an unsuccessful effort was made by the organized postal clerks of the United States Railway Mail Service (an A. F. of L. affiliate) to secure immunity from the section of the New York Civil Rights Law which forbids any labor organization in the state to deny any person membership or equal privileges because of race, color, or creed. The due process clause of the Fourteenth Amendment is not violated by this statute since there is no arbitrary abridgment of property rights or liberty of contract. Nor is there denial of equal protection because, while the state regulates membership in an organization of government employees, it does not extend to them the customary privileges of collective bargaining. The state statute in no way conflicts with any Federal interest under the postal power. There is no interference with the mail service, and no burden on the government.

VALIDITY OF STATE LAWS REGULATING LABOR UNIONS

Beginning in 1943, a substantial number of states, many of them in the South, have passed statutes designed to regulate labor unions, and in varying degrees to curb their activities. It was inevitable that some of these would appear to clash either with the more liberal policies embodied in Federal labor statutes or with constitutional prohibitions. Cases are moving to the Supreme Court in which the validity of these state laws is being questioned. Such a case is *Thomas v. Collins* (Jan. 8, 1945) involving a statute passed in Texas in 1943. This act required all labor union organizers operating in the State of Texas to secure from the Secretary of State an organizer's card before soliciting any members for his organization. In order to secure the card he was obliged to give his name, his union affiliations, and his credentials. The Secretary of State had no discretion to refuse to register such an organizer if his application was properly made. The organizer was given a card which he was required to carry with him and to show to any person whom he solicited for membership. The act subjected labor unions to various requirements which were not brought to issue in this case. R. J. Thomas, president of the United Automobile Workers and vice president of C. I. O., went to Texas after the passage of this act for the purpose of addressing a labor union meeting. The fact that Thomas was to speak was widely advertised well in advance. Thomas did not apply for registration as a labor organizer as required by the state statute, but proceeded to address a meeting of about 300 union men. In the course of his address he specifically invited any non-union persons present to join the union, and at the close of the meeting he specifically solicited membership of a particular person, named in the record. All this was done in order to permit a legal test of the validity of the state requirement. Prior to the meeting, a restraining order had been served on Thomas, forbidding him to address the meeting in the capacity of an organizer, and he was subsequently cited for contempt for a deliberate and willful violation of the order.

Five justices produced three opinions holding the Texas statute invalid as an unreasonable interference with freedom of speech. The leading opinion was written by Mr .Justice Rutledge. He emphasized the fact that the meeting addressed by Thomas was entirely orderly and that both the right of free assembly and of freedom of speech were concerned in the case. He rejected the idea that the guarantee of freedom of speech can not be applied to businesses or economic activities. It was admitted that there was no prior censorship of Thomas' speech, nor was any discretionary authority vested in any state officer to deny him the right to register as a labor union organizer. The opinion held, however, that the simple requirement of previous identification can not validly be imposed upon one

U. OF I. LIB.
UNDERGRAD. DIV., CHIC.

who wishes to exercise his rights under the First Amendment. It would be unconstitutional to forbid Thomas to hold his meeting and make his speech, and it is therefore unconstitutional to punish him for not having previously registered as a condition of the privilege of doing so.

The Rutledge opinion is significant for the clear and unequivocal statement which it contains that the guarantees of the First Amendment—freedom of speech, press, religion, and assembly—occupy preferred status in our scheme of constitutional values. Since this is true, no presumption of validity attaches to any legislation which on its face appears to infringe any of these guarantees. "Any attempt to restrict those liberties must be justified by a clear public interest, threatened not doubtfully or remotely, but by clear and present danger. The rational connection between the remedy provided and the evil to be curbed, which in other contexts might support legislation against attack on due process grounds, will not suffice. These rights rest on firmer foundations. Accordingly, whatever occasion would restrain orderly discussion and persuasion, at appropriate time and place, must have clear support in public danger, actual or impending. Only the gravest abuses, endangering paramount interests give occasion for permissible limitation . . ." A majority of the Court did not agree that the statute conflicted with the provisions of the National Labor Relations Act, and the decision rests, therefore, solely upon the constitutional point just discussed.

Mr. Justice Roberts, with whom the Chief Justice and Justices Reed and Frankfurter concurred, took the position that the registration requirement was a reasonable police regulation which did not interfere with freedom of speech but merely required a paid labor union organizer to identify himself as such.

In *Hill v. Florida* (June 11) a more far-reaching Florida statute was held invalid on the ground of conflict with the National Labor Relations Act. This statute required every person acting as a business agent for a labor union to procure a state license before acting in such capacity. To procure the license he must show that he has been a citizen of the United States for more than ten years, has never been convicted of felony, and is a person of good moral character. The license could then be issued by a special board created for the purpose, not as a routine matter, but in the exercise of its discretion in determining whether the applicant met the standards imposed by the act. Various requirements not here involved were also imposed by the statute upon labor unions. Hill violated the law by refusing to procure a license and an injunction was issued to restrain his further activity as a labor union agent. In a brief opinion by Mr. Justice Black, the Court pointed out that the Wagner Act, both in its history and in its provisions, places peculiarly strong emphasis upon the complete freedom of labor organizations to choose those who shall represent them in collective bargaining. The Florida statute limits this full freedom of choice and is, therefore, in direct conflict with the Federal act. Justices Frankfurter and Roberts dissented.

An Alabama statute of 1943 set up drastic regulations affecting the internal affairs and activities of labor organizations, forbade various kinds of picketing, regulated boycotting and striking, and imposed civil liability and criminal penalties upon unions for violations of the act. Two suits were brought in the Alabama courts to secure declaratory judgments adjudicating the constitutionality of the Alabama statute. These cases were brought to the Supreme Court in *Alabama State Federation of Labor v. McAdory* (June 11) and *Congress of Industrial Relations v. McAdory* (June 11). Speaking in each case through Chief Justice Stone, the Court declined to pass upon the various constitutional issues presented on the ground that they were inappropriate for decision in a declaratory judgment proceeding. The act had not been put into operation; its provisions had not been judicially construed by the state courts, and there were many points upon which the Court could hope to reach no well-considered opinion. The cases were, therefore, dismissed.

ASSOCIATED PRESS VIOLATION OF THE SHERMAN ACT

Nationwide attention was drawn to the Court's decision in *Associated Press v. United States* (June 18) enjoining the enforcement of certain by-laws of the Associated Press because they violated the Sherman Act. The issue in the case had been dramatized by the inability of Marshall Field's recently established newspaper, the *Chicago Sun,* to secure AP membership. The relevant facts are as follows. The AP is a cooperative association incorporated in New York. It has some 1,200 newspaper members, and its business is the collection, assembly, and distribution of news. It is financed by an assessment plan which contemplates no profit to AP. The by-laws prohibited all AP members from selling news to any non-members and set up rules by which membership could be acquired. It was made easy for a paper which does not compete with an AP member to join, but when an applicant for membership would compete with an old AP member its chances of admission were very slim.

In such case the applicant's member competitor could object to the admission. Over this objection the applicant paper could gain membership only by a vote of a majority of all AP members, by relinquishing to its AP competitor any exclusive news or news picture rights it might have, and by paying to AP 10 per cent of "the total amount of the regular assessments received by it from old members in the same competitive field during the entire period from Oct. 1, 1900" to the date of admission. Thus to secure AP privileges in the morning field in Chicago at the time of this suit would cost $416,631.90 and in the evening field, $595,772.31.

A divided Court found these restrictive arrangements to be restraints of trade forbidden by the Sherman Act. Mr. Justice Black wrote the principal opinion. He alluded to the well-established doctrine that AP is engaged in interstate commerce and that its activities are not placed beyond the reach of the Sherman Act because they are cooperative rather than strictly commercial. It was argued that the AP regulations did no more than reserve to the members the products of their own enterprise and ingenuity. This might protect a single newspaper in a policy of exclusion, but the Sherman Act was specifically designed to prevent independent business from combining in a common plan "to reduce their competitors' opportunity to buy or sell the things in which the groups compete." Nor is the AP immune from the prohibitions of the act because its services are not "indispensable."

The statute justifies no such test of "indispensability." It is pointed out that "by the restrictive By-laws each of the publishers in the combination has, in effect, surrendered himself completely to the control of the association in respect to the disposition of news in interstate commerce." To forbid this is not to convert a newspaper into a public utility, with an obligation of common service, but merely to hold that "arrangements or combinations designated to stifle competition cannot be immunized by adopting a membership device accomplishing that purpose." Finally, the opinion rejects the argument that to apply the Sherman Act to the AP abridges the freedom of the press guaranteed by the First Amendment. There is no applicability here of the "clear and present danger" test which the courts have used to protect the freedom to speak, write, and publish. The clear and present doctrine provides "no shield for business publishers who engage in business practices condemned by the Sherman Act." "Freedom to publish is guaranteed by the Constitution, but freedom to combine to keep others from publishing is not." The Court, therefore, affirmed the decree of the lower court enjoining the continued enforcement by AP of its present restrictions on applications for membership.

In a concurring opinion Mr. Justice Douglas emphasized that the decision does not direct AP to serve all applicants, but merely to cease discriminating against competitors of its members in the same field or territory. A concurring opinion by Mr. Justice Frankfurter emphasized the peculiar interest which the public has in newspapers and concluded that the AP by-laws are not merely restraints on commerce but also "offend the basic functions which a constitutionally guaranteed free press serves in our nation." Mr. Justice Roberts dissented in an opinion in which Chief Justice Stone concurred, and Mr. Justice Murphy dissented separately.

LABOR UNIONS AND THE SHERMAN ACT

In *Hunt v. Crumboch* (June 18) the Court held in a five-to-four opinion by Mr. Justice Black that a labor union does not violate the Sherman Act because it refuses to admit to membership the employees of a trucking company engaged in interstate commerce, and by closed shop agreements with its competitors drives the company out of business. However, in *Allen Bradley Co. v. Local Union No. 3* (June 18), the Court held that a union did violate the Sherman Act when it combined with its employers and with the manufacturers of goods to restrain competition in, and monopolize the marketing of, such goods. Here an electrical workers' union had made closed-shop agreements with the makers and sellers of electrical equipment in metropolitan New York which made it completely impossible for competitors to break into this market. "We think Congress never intended that unions could, consistently with the Sherman Act, aid nonlabor groups to create business monopolies and to control the marketing of goods and services."

THE FAIR LABOR STANDARDS ACT

Three cases arose under the Fair Labor Standards Act. In *Western Union Telegraph Co. v. Lenroot* (Jan. 8, 1945) the Court held the child labor provisions of the act inapplicable to the children employed by the company as messenger boys. The statute forbids any producer, manufacturer, or dealer to ship in commerce any goods produced in an establishment in which child labor is employed. While telegraphic messages are "subjects of commerce" and hence "goods" within the meaning of the act, the Court concluded that the company does not "produce" these telegraphic messages, nor does it "ship" them in the sense in which the word "ship" is commonly used. In *Gemsco v. Walling* (Feb. 26) it is held that the Fair Labor Standards Act authorizes the prohibition of industrial homework when this is necessary in order to make effective a minimum wage order for an industry. In *Jewell Ridge Coal Corporation v. Local No. 6167, U. M. W.* (May 7) the Court, following an earlier ruling made in the iron mining industry, held that under the Fair Labor Standards Act bituminous coal miners were entitled to be paid for the time spent "travelling from the portals to their usual places of work and return." This "portal-to-portal pay" issue had loomed large in the dispute in the coal industry which had created a serious threat of a strike.

FULL FAITH AND CREDIT AS APPLIED TO DIVORCES

It will be recalled that in 1942 the Court held in the case of *Williams v. North Carolina* (317 U. S. 287) that the full faith and credit clause of the Constitution required North Carolina to recognize the validity of Nevada divorces granted to a man and wife who had left North Carolina and gone to Nevada in order to secure the divorce, even though the two defendant spouses had neither been served with summons nor put in an appearance. In this case the two divorced persons remarried in Nevada and returned to North Carolina where they were prosecuted for bigamous cohabitation. This case left open the important question whether North Carolina could refuse recognition to the Nevada divorces, not on the ground just mentioned, but on the ground that the courts of Nevada did not have jurisdiction over the parties because of the inadequate and fraudulent character of their domicile in Nevada.

This question was raised in *Williams v. North Carolina* (May 21), and a majority of the Court in an opinion written by Mr. Justice Frankfurter held that under the facts disclosed by the record North Carolina was justified in concluding that Nevada did not have jurisdiction over the parties, and could not, therefore, issue a decree of divorce which North Carolina was bound to respect. It sustained the conviction of Williams and his wife on the criminal charge already mentioned. The opinion emphasized that the obligation of the states of the Union to accord full faith and credit to a judicial decree of any other state arises only if that state has jurisdiction to issue the decree. The question whether this jurisdiction does or does not exist can not be conclusively settled by the state court asserting the jurisdiction. This jurisdiction is subject to impeachment in the Supreme Court. Since this is true, the existence of *bona fide* domicile in Nevada became the decisive issue in this case and the Court agreed with the North Carolina court that there was no such domicile. The record showed that petitioners, long-time residents of North Carolina, went to Nevada, where they stayed at an auto court for transients, filed suits for divorce as soon as the Nevada law permitted, married one another as soon as the divorces were obtained, and promptly returned to North Carolina to live. Under these circumstances North Carolina was fully entitled to draw the inference that Williams and his wife had never abandoned their domiciles in North Carolina and were, therefore, not lawfully divorced by the Nevada decree.

A concurring opinion by Mr. Justice Murphy, joined by the Chief Justice and Mr. Justice Jackson, registers a marked degree of sympathy for the unfortunate couple now finally convicted of crime "for acts which they probably committed in reliance upon advice of counsel and without intent to violate the North Carolina statute." In the case of Justices Rutledge, Black, and Douglas, however, this concern for the rights of the convicted man and wife led to a vigorous dissent. Mr. Justice Black urged that the conviction denies due process of law, since criminality is imposed on grounds which could not have been foreseen by those who were punished. While ignorance of the law excuses no man "it is quite a different thing however to sentence people to prison for lacking the clairvoyant gift of prophesying when one judge or jury will upset the findings of fact made by another." It is generally agreed that the first Williams case injected a degree of confusion into the legal status of out-of-state divorces. It is not easy to see that the second Williams case has done much to clear up that confusion. There can be little doubt that if the doctrine is rigidly adhered to and aggressively enforced, a good many thousand people who have secured Nevada divorces and subsequently remarried are presently liable to criminal prosecution.

I. AMERICAN POLITICAL HISTORY

FEDERAL ADMINISTRATIVE AGENCIES

By John A. Tillema
Professor, The George Washington University

GENERAL

A feature of the record of administrative agencies during 1945, was the repeated use made by the President of Federal departments to operate industries in such a manner as was deemed necessary for the successful prosecution of the war. The first typical instance of this practice was the order of the President to the Secretary of War authorizing him to take possession of the properties of the Cleveland Electric Illuminating Co. together with any real and personal property wherever situated and to operate such property in such a manner as he deemed necessary. The possession of the property was to be relinquished within 60 days after the Secretary should determine that the possession was no longer necessary for the prosecution of the war. The order was issued by President Roosevelt on Jan. 12, 1945.

Another feature of the year was the use of the military commission, an executive or administrative tribunal, to apply the military law of the United States to cases and situations arising from the war.

MILITARY COMMISSIONS

On Jan. 11, 1945, the President as Commander in Chief of the Army and Navy in pursuance of the Constitution and Statutes of the United States and, particularly, the Thirty-eighth Article of War ordered:

1. That all persons who are subjects, citizens or residents of any nation at war with the United States or who give obedience to or act under the direction of any such nation, and who during the time of war enter or attempt to enter the United States or any of its territories or possessions, through coastal or boundary defences, and are charged with committing or attempting to commit sabotage, espionage, hostile or warlike acts, or any violations of the law of war, shall be subject to the law of war and to the jurisdiction of the military tribunals. The commanding generals of the several service and defense commands in the United States and Alaska, under the supervision of the Secretary of War, were empowered to appoint military commissions for the trial of such persons.

2. Every military commission established for the trial of the persons indicated was empowered and required, as occasion demanded, to make rules for the conduct of its proceedings, consistent with the powers of military commissions under the Articles of War, such as it should deem necessary for a full and fair trial of the matters before it. Such evidence should be admitted as would, in the opinion of the president of the commission, have probative value to a reasonable man. The concurrence of at least two thirds of the members of the commission present at the time the vote was taken should be necessary for a conviction or sentence. The provisions of Article 70 of the Articles of War, dealing with investigation and preliminary hearings should not be applied to the proceedings. The record of the trial, including the judgment or sentence, should be promptly reviewed according to the procedures established under Article 50 of the Articles of War.

The policy outlined in the order seems to be an extension of the procedure used by President Roosevelt during the first year of participation in the war when he created a military commission to try the persons who landed on our coast to carry out a mission of sabotage and destruction.

PROSECUTION OF WAR CRIMES

By executive order of May 2, 1945, President Truman appointed Associate Justice Robert H. Jackson to act as the representative of the United States and as its Chief Counsel in preparing and prosecuting charges of atrocities and war crimes against such leaders of the European Axis powers and their principal agents and accessories as the United States might agree with any of the United Nations to bring to trial before an international military tribunal. Our representative is to serve without additional compensation but he will receive such allowances for expenses as may be authorized by the President. Justice Jackson was authorized to select and recommend to the President, or to the head of any executive department or agency, necessary personnel to assist in the performance of his duties. The head of each executive department, independent establishment, or agency was authorized in the performance of the duties of the representative named to employ such personnel and make such expenditures within the limits of appropriations now or hereafter available for the purpose as may be deemed necessary to carry out the purposes of the President's order. The heads of departments were permitted to make available, assign or detail for duty with the representative named such members of the armed forces and other personnel as might be requested for such purposes.

The representative named was authorized to cooperate with, and receive the assistance of any foreign government to the extent deemed necessary by him to accomplish the purposes of the President's order.

REPRESENTATION ON INTERNATIONAL MILITARY TRIBUNAL

In accordance with the provisions of the Charter of the International Military Tribunal established by the Government of the United States, the Provisional Government of the French Republic, the Government of United Kingdom of Great Britian and Northern Ireland, and the Government of the Union of Soviet Socialist Republics for the trial and punishment of major war criminals of the European Axis and pursuant to their agreement of Aug. 8, 1945, President Truman appointed Francis Biddle of Pennsylvania to represent the United States on the International Military Tribunal and John J. Parker of North Carolina to be the alternate member of the Tribunal.

The Member of the United States will receive such compensation and expense allowances as the Secretary of State may determine. The Alternate Member will receive no salary but the Secretary of State will determine what expense allowances shall be paid to him.

The Secretary of State, the Secretary of War, the Attorney General, and the Secretary of the Navy were authorized to provide appropriate assistance to the Member and the Alternate in the performance of their duties and might detail personnel, including members of the armed forces, as might be requested for the purpose.

CHIEF COUNSEL FOR PROSECUTION OF JAPANESE WAR CRIMES

By executive order of Nov. 29, 1945, President Truman, in order to enable Joseph B. Keenan as Chief Counsel in the preparation and prosecution of charges of war crimes against the major leaders of Japan and their principal agents and accessories, authorized him to select and recommend to the President or the head of any executive department, independent establishment, or other Federal agency, necessary personnel to assist him in his duties. The heads of departments, independent establishments and agencies were authorized to assist the Chief Counsel and to employ such personnel and make such expenditures within the appropriations now or hereafter available as might be deemed necessary. As many of the personnel of the armed forces as might be requested by the Chief Counsel were to be detailed to assist. He was also authorized to cooperate with and receive the assistance of any foreign government to the extent deemed necessary by him.

COURT MARTIAL CASES

On May 26, 1945, by reason of the increasing burdens upon the President owing to the pressure of war conditions, he ordered as follows: that there be transferred and delegated to each of the following, namely, the Secretary of War and the Under Secretary of War, the functions, duties, and powers of confirmation vested in the President under Article of War 48, together with the power of commutation and all the functions, duties, and powers vested in the President by Articles 49, 50, 50½, 51 and 52 in all cases of sentences except those extending to death; and to each of the following, namely, the Secretary of the Navy and the Under Secretary of the Navy, all functions, duties, and powers of confirmation vested in the President under Article 53 of the Articles for the Government of the Navy, in all cases of sentences except those extending to the loss of life.

AMENDMENT OF PUBLIC LAND ORDERS

By executive order of Feb. 28, 1945, it was decreed by the President that a long list of executive and public land orders, by which more than 13,000,000 acres of public lands had been withdrawn and reserved for the use of the military and other branches of the Government for purposes incident to the various phases of the national emergency and the prosecution of the war, be amended by adding to each of the orders the following paragraph: "The jurisdiction granted by this order shall cease at the expiration of the six month period following the termination of the unlimited national emergency declared by Proclamation No. 2487 of May 27, 1941. Thereupon jurisdiction over the lands thereby reserved shall be vested in the Department of the Interior or any other department or agency of the Federal government according to their respective interest then of record. The lands, however, shall remain withdrawn from appropriation as herein provided until otherwise ordered."

OFFICE OF INTER-AMERICAN AFFAIRS

By executive order of March 23, 1945, the name of the office of Co-ordinator of Inter-American Affairs, within the Office for Emergency Management of the Executive Offices of the President, was changed to the Office of Inter-American Affairs. The order provides that there shall be at the head of the office a director, appointed by the President, who shall perform his functions under the direction of the President and in conformity with the foreign policy of the United States as defined by the Secretory of State through the Assistant Secretary of State in charge of relations with the American Republics. He shall be charged with all duties and responsibilities hitherto performed by the co-ordinator. The new director receives a salary of $10,000 per annum plus necessary transportation, subsistence, and other expenses incidental to the performance of his duties. Wallace K. Harrison was appointed Director of the Office of Inter-American Affairs.

ECONOMIC STABILIZATION BOARD

By executive order of April 3, 1945, the Federal Loan Administrator and the War Food Administrator were designated as additional members of the Economic Stabilization Board which was created Oct. 15, 1942.

NATIONAL WAR LABOR BOARD

The executive order establishing the National War Labor Board was amended April 4, 1945 by increasing the number of public members from four to eight. Not more than four of such public members were to vote on any one matter. The order of Jan. 24, 1942, providing for the appointment of associate members of the Board, and the order of Nov. 20, 1943, providing for the appointing of alternate public members of the Board were revoked.

By executive order of Dec. 31, 1945, President Truman abolished the National War Labor Board and created in its stead a six-man National Wage Stabilization Board. The six-man board will be composed of a chairman and vice chairman representing the public, two members representing labor, and two representing industry. W. Willard Wirtz, named to head the Board, is the former general counsel of the War Labor Board. Sylvester Garrett, formerly regional chairman of the Philadelphia War Labor Board, was named vice chairman. Carl J. Shipley is the former CIO member of the War Labor Board, and Robert J. Watts is the American Federation of Labor's international representative. Management's representatives are: R. Randall Irwin, who is affiliated with the Lockheed Aircraft Corporation, and Earl Cannon, who was also an industry member of the War Labor Board, is a Wisconsin trucking company official.

TRANSFER OF WATER AND SEWAGE SYSTEMS TO PANAMA

As a result of discussions between the Government of the United States and the Government of Panama, pursuant to an exchange of notes accessory to the treaty between the two countries of March 2, 1936 and pursuant to a joint resolution of Congress of May 3, 1943, which authorized the transfer by the President of the United States to the Republic of Panama of all right, title, and interest to water and sewage systems installed by the United States in the cities of Panama and Colon, with certain provisions and reservations, President Truman directed the Governor of the Panama Canal Zone to make the transfer.

TERMINATION OF THE OFFICE OF CIVILIAN DEFENSE

By executive order of June 4, 1945, the Office of Civilian Defense, established May 20, 1941, was terminated. Except in so far as the functions were transferred, the Office of the Director and all the powers and functions were abolished. All protective property of the Office was transferred to the Department of Commerce. All functions hitherto vested in the Director incident to the storage, care, transportation, and disposition of such property were transferred to the Secretary of Commerce and were to be exercised by him in accordance with the Surplus Property Act of 1944 and the regulations and designations of the Surplus Property Board. Detailed directions were given for the liquidation of the affairs of the Office.

RELEASE OF SCIENTIFIC INFORMATION

By executive order of June 8, 1945, the Director of War Mobilization and Reconversion was authorized to review all scientific and technical information which (1) has been or may hereafter be developed by or for, or with the funds of any department or agency of the Government, and (2) is now, or may hereafter be classified as secret, confidential, restricted or by other comparable designation, or otherwise withheld from the public for the purposes of the national military security.

All the departments and agencies were required to furnish the Director all information that he might request as essential to the performance of his duties. There was excluded from the order any scientific information which the President should declare to be in a closed field of information.

The Director, in determining what information should be released, was required to follow a carefully designed procedure to safeguard the security of the American public.

COMMISSIONED CORPS OF THE PUBLIC HEALTH SERVICE

By executive order of June 12, 1945, the commissioned corps of the Public Health Service was declared to be a military service and a branch of the land and naval forces of the United States during the period of the War. The Commissioned Corps of the Service was to be subject for the duration to the Articles for the Government of the Navy.

TERMINATION OF WAR FOOD ADMINISTRATION

By executive order of June 29, 1945, the War Food Administration was terminated and its functions were transferred to the Secretary of Agriculture. The Office of the Administrator with all its records, personnel, funds and agencies were transferred to be administered in the future in a manner determined by the Secretary of Agriculture. He was clothed with authority to confer on any person or persons to whom he might make delegations, under the transfer, the power to make further delegations to any person or persons in the Department of Agriculture. All orders, directives, rules, and regulations relating to any matter within the scope of the authority of the War Food Administrator were to remain in full force and effect unless modified or revoked by the Secretary.

PRESIDENT TRUMAN'S TRANSITION AND RECONVERSION POLICY

By executive order of Aug. 18, 1945, President Truman laid down the guiding policies of all departments and agencies of the Government concerned with the problems arising out of the transition from war to peace. The departments and agencies were to assist in the maximum production of goods and services required to meet domestic and foreign needs; (1) by assuring assistance in making available materials and supplies required for the production of such goods and services; (2) by providing assistance to the conversion and utilization of war plants and facilities both publicly and privately owned; and (3) by providing effective job placement assistance to war workers and returning servicemen and women.

They were to continue stabilization of the economy as authorized and directed by the Emergency Price Control Act of 1942, as amended, and the Stabilization Act of 1942, as amended, (1) by using all powers conferred therein and all other lawful means to prevent inflation or deflation, and (2) while so doing by making whatever modifications in controls over prices, wages, materials, and facilities are necessary for an orderly transition from war to peace. Finally, they were to move as rapidly as possible without endangering the stability of the economy toward the removal of price, wage, production and other controls toward collective bargaining and the free market.

During the transition to a free economy, the Secretary of Agriculture, the Federal Loan Administrator, and the Director of Economic Stabilization should take all measures authorized by law which might be necessary to prevent any collapse in values or discouragement of the full and effective use of productive resources.

The Price Administrator, and in the exercise of his price responsibilities, the Secretary of Agriculture, subject to the directives provided by law by the Economic Stabilization Director, should take all necessary steps to assure that the cost of living and the general level of prices should not rise. Subject to such authority, the Price Administrator and the Secretary of Agriculture were authorized to make such adjustments in existing price controls as were necessary to remove gross inequities which would interfere with an effective transition to a peacetime economy. In order that any price increases found necessary for these purposes should not result in an increase in the cost of living, the Price Administrator and the Secretary of Agriculture should, so far as reasonably practicable and necessary for the purpose, see that such price increases should not cause increases at later levels of production and distribution. They should improve and tighten controls in those fields which are important in relation to production costs or the cost of living and in which, in their judgment, the controls have hitherto been ineffective.

The National War Labor Board and such other agencies as might be designated by the Director of Economic Stabilization, with the approval of the Director of War Mobilization and Reconversion, were authorized to provide that employers might, through collective bargaining with duly certified and recognized representatives of employees, or, if there were no such representatives, by voluntary action, make wage and salary increases without the necessity of obtaining approval therefor, upon the condition that such increases should not be used in whole or part as the basis for seeking an increase in price ceilings or resisting the otherwise justifiable reductions in price ceilings.

The War Production Board should move as rapidly as feasible, without endangering orderly reconversion and the stabilization of the economy, to free business from its controls. During the transition it should use all of its powers to expand the production of materials which are in short supply, limit the manufacture of products for which the materials or facilities are insufficient, control the accumulated inventories so as to avoid speculative hoarding and unbalanced distribution, which would curtail total production, grant priority assistance to break bottlenecks which would impede the reconversion process, facilitate the fulfillment of relief and other essential export programs, and allocate scarce materials or facilities necessary for the production of low priced items essential to the continued success of the stabilization program.

TERMINATION OF THE OFFICE OF WAR INFORMATION

On Sept. 1, 1945, there were transferred to and consolidated in an Interim International Information Service in the State Department, those functions of the Office of War Information and those informational functions of the Office of Inter-American Affairs which are performed abroad or which consist of and are concerned with informing the people of other nations on matters in which the United States has an interest.

TERMINATION OF WAR REFUGEE BOARD

By executive order of Sept. 14, 1945, the War Refugee Board, established Jan. 22, 1944, in the Executive Offices of the President, was terminated. The Secretary of the Treasury was directed to liquidate all its activities and obligations and wind up its affairs.

TERMINATION OF THE OFFICE OF FISHERY COORDINATION

By executive order of Oct. 29, 1945, the Office of Fishery Coordination was terminated. The Secretary of the Interior, acting through the Fish and Wild Life Service or any other agency of the Department of the Interior, designated by the Secretary, was authorized to wind up the affairs of the Office.

TERMINATION OF THE OFFICE OF STRATEGIC SERVICES

By executive order of Sept. 20, 1945, there were transferred to the Department of State the functions of the Research and Analysis Branch and the functions of the Presentation Branch of the Office of Strategic Services, excluding such functions as are performed within Germany and Austria. The functions of the Director of Strategic Services and of the United States Joint Chiefs of Staff, relating to the functions transferred, were also placed with the Department of State. All functions of the Office of Strategic Services, not transferred to the Department of State, were transferred to the Department of War.

TRANSFERS TO THE DEPARTMENT OF LABOR

By executive order of Sept. 19, 1945, all the functions of the Chairman of the War Manpower Commission, together with all the functions, agencies, officers, employees, records, property, and funds of the Commission, were transferred to the Secretary of Labor. The National War Labor Board and all of its functions, officers, employees, records, property, and funds were transferred to the Department of Labor to be governed by such policies as the Secretary of Labor should prescribe. The Retraining and Reemployment Administration, established by the War Mobilization and Reconversion Act of 1944, was also transferred to the Department of Labor. The United States Employment Service and all the functions in the Department relating to employment services, the National War Labor Board and its functions, and the Retraining and Reemployment Administration were established in the Department of Labor to be administered as organizational entities of that Department.

TERMINATION OF FOREIGN ECONOMIC ADMINISTRATION

By executive order of Sept. 27, 1945, the Foreign Economic Administration was terminated and its functions distributed among several departments and agencies.

There were transferred to the Department of State all the functions of the Administration with respect to: (a) the Administration of the Act of March 11, 1941, entitled "An Act further to promote the defences of the United States and for other purposes"; (b) the participation by the United States in the United Nations Relief and Rehabilitation Administration; (c) activities in liberated areas with respect to supplying the requirements of and securing materials in such areas; (d) the gathering, analysis, and reporting of economic and commercial information, in so far as such functions are performed abroad; (e) the planning of measures for the control of occupied territories; and (f) the administration and allocation of certain funds.

There were transferred to the Reconstruction Finance Corporation the following: (a) the Rubber Development Corporation, the Petroleum Reserves Corporation, the U. S. Commercial Company with all their functions, capital stock, assets, and liabilities. The board of directors of the Reconstruction Finance Corporation may reconstitute the boards of directors of the transferred corporations.

There were transferred to the Department of Commerce all the functions with respect to: (a) export control; (b) the Technical Industrial Intelligence Committee; and (c) the facilitation of trade, including functions affecting foreign trade, domestic commerce, and the Clearing Office for Foreign Transactions and Reports.

There were transferred to the Department of Agriculture the functions of the Office of Foreign Programs and all other functions of the Administration with respect to food, food machinery, and food facilities.

For the purpose of unifying the disposition of foreign property, owned by the United States in foreign areas under a single agency acting in conformity with the foreign policy of the United States and with the Surplus Property Act of 1944, there were transferred to the Department of State all the functions of the Army and Navy Liquidation Commission and all the functions of the War and Navy Departments relating to the disposition abroad of property captured from the enemy.

CIVILIAN PRODUCTION ADMINISTRATION

By executive order of Oct. 4, 1945, the War Production Board, established Jan. 16, 1942, was terminated, and all agencies, employees, property, and funds were transferred to a new Civilian Production Administration which was established in the Office for Emergency Management in the Executive Offices of the President. At the head of the new Board is to be an administrator appointed by the President with a salary of $12,000 per annum, unless Congress shall otherwise provide. The Administrator must exercise his functions and powers in accordance with the general policies established by the Director of War Mobilization and Reconversion.

The functions and powers transferred are to be exercised to further a swift and orderly transition from wartime production to a maximum peacetime production free from wartime controls, with a regard for stability of prices and costs, and to that end shall be utilized: (a) to expand the production of materials which are in short supply; (b) limit the manufacture of products for which materials and facilities are insufficient; (c) control the accumulation of inventories so as to avoid speculative hoarding and unbalanced distribution which would curtail total production; (d) grant priority assistance to break bottlenecks which would impede the reconversion process; (e) facilitate the fulfillment of relief and other essential export programs; and (f) allocate scarce materials and facilities necessary for the production of low priced items essential to the continued success of the stabilization program of the Federal Government.

TERMINATION OF OFFICE OF SURPLUS PROPERTY

By executive order of Oct. 19, 1945, the Office of Surplus Property in the Department of Commerce was terminated, and all the personnel, records, property, contracts, obligations, and funds relating primarily to surplus property disposal functions were placed under the Reconstruction Finance Corporation.

TRANSFER OF SHIPBUILDING STABILIZATION COMMITTEE

By executive order of Nov. 15, 1945, the Shipbuilding Stabilization Committee of the Civilian Production Administration, established by administrative order of the Chairman of the War Production Board, was transferred to the Department of Labor.

TRANSFER OF SMALLER WAR PLANTS CORPORATION

By executive order of Dec. 27, 1945, with certain enumerated exceptions, all the functions of the Smaller War Plants Corporation were transferred to the Reconstruction Finance Corporation. All functions not transferred to the Reconstruction Finance Corporation were transferred to the Department of Commerce.

REORGANIZATION OF THE NAVY DEPARTMENT

By executive order of Oct. 3, 1945, the following directives were given to the Secretary of the Navy:

1. In order to provide for the effective integration of its activities the Navy Department shall hereafter be organized to take cognizance of the major grouping of military matters, general and administrative matters, and business and related industrial matters. The structure of the organization to accomplish this purpose shall be such as the Secretary of the Navy may deem appropriate and necessary with due regard for the necessity for delegation and decentralization.

2. The Secretary of the Navy shall prescribe such duties for the Under Secretary of the Navy and the Assistant Secretaries of the Navy as may be appropriate and necessary to effectuate the provisions of the Order.

3. The Marine Corps is an integral part of the naval establishment. In time of war or when the President shall so direct the Coast Guard is a part of the naval establishment.

4. The Chief of Naval Operations: (a) shall be the principal naval advisor to the President and to the Secretary of the Navy on the conduct of war and principal adviser to the Secretary of the Navy on the conduct of the activities of the naval establishment; (b) shall have command of the operating forces comprising the several fleets, sea going forces, and the related shore establishments of the Navy, and shall be responsible to the Secretary of the Navy for their use in war and plans and preparations for their readiness for war; (c) shall be charged, under the direction of the Secretary of the Navy, with the preparation, readiness, and logistic support of the operating forces, comprising the several fleets, sea going forces, sea frontier forces, district and other forces and related shore establishments of the Navy and with their coordination.

5. The Staff of the Chief of Naval Operations shall be composed of such members of the Vice Chiefs of Naval Operations, Deputy Chiefs of Naval Operations, Assistant Chiefs of Naval Operations, a naval Inspector General, and such other officers as may be deemed by the Secretary of the Navy to be appropriate and necessary for the performance of the duties prescribed for the Chief of Naval Operations.

6. There shall be in the Navy Department (a) an office charged with the coordination of the activities of bureaus and offices to effectuate common policies of procurement, contracting and production of material throughout the naval establishment, and (b) an office charged with the coordination of naval research, experi-

mental tests and development activities, and such related duties as may be appropriate.

7. The bureaus and offices of the Navy Department, in addition to the chiefs of such bureaus and offices, shall be staffed by such officers, including a deputy and one or more assistant chiefs.

8. During the temporary absence of the Secretary of the Navy, the Under Secretary of the Navy, the Assistant Secretary of the Navy, the Assistant Secretary of the Navy for Air, and the Chief of Naval Operations, in that order, shall be next in succession to act as Secretary of the Navy. In the absence of the Chief of Naval Operations, the Vice and Deputy Chiefs of Naval Operations shall be next in succession in accordance with relative rank.

ELECTIONS OF 1945

By Thomas N. Hoover
Professor, Ohio University

Virginia.—In the year of 1945, there were but few elections of any significance in the United States. Only one governor was elected and that in the Democratic state of Virginia. With but slight opposition, Governor Colgate W. Darden, Jr., the Democratic candidate, was re-elected. Virginia thus remains in the solid south.

New York City.—The election of a mayor to succeed the colorful Fiorello LaGuardia was the principal attraction. The Democratic candidate was William O'Dwyer; Jonah J. Goldstein was the Republican candidate; Newbold Morris, LaGuardia's choice, ran on the No Deal ticket. O'Dwyer was elected, and New York City remains Democratic.

Detroit.—Perhaps the most important election of the year, as indicating political trends, was that in Detroit, Mich. The Democratic candidate for mayor was Richard T. Frankensteen, an outstanding labor leader. The Republicans nominated Mayor Edward J. Jeffries for another term. Jeffries was re-elected with a vote of 274,435 to 216,917 for his opponent.

Montana.—In the House of Representatives, the Republicans replaced a Democrat from the State of Montana. The district had been Democratic for many years.

Dewey and the Japanese Code.—The few straws in the wind in 1945 would indicate a turn away from the New Deal. Since the elections, several other events have happened that will perhaps have political reactions in the 1946 elections. One of these, is a disclosure of the fact that the Administration knew the Japanese code throughout most of the year of 1941. Governor Dewey, at the request of the Chief of Staff, did not permit the use of the Pearl Harbor responsibility in the campaign.

President Truman and Congress.—President Truman, in January, 1946 gave Congress a severe scolding for refusing to pass some very questionable legislation. Unless the breach between the President and the Democratic Congress is healed before November, there seems little chance of the Democrats retaining control of the House of Representatives.

DIVISION II

INTERNATIONAL AFFAIRS AFFECTING THE UNITED STATES

THE UNITED STATES IN WARTIME AND AFTER

By Winifred N. Hadsel
Research Associate, Foreign Policy Association

QUESTIONS OF INTERNATIONAL COOPERATION

While a number of nations continued during 1945 to express doubts about the willingness of the United States to give effective aid in solving the difficult political and economic problems arising out of the war, the Administration in Washington attempted to show that this country had overcome its classic isolationism and was ready to support cooperative international reconstruction measures.

To insure approval at home for this program of continued collaboration with the other United Nations, both President Roosevelt and President Truman attempted to persuade the American people that it would be folly to let divergences among the Big Three lead to rejection of international cooperation. In his annual message to Congress on the state of the union, on Jan. 6, 1945, President Roosevelt declared that "perfectionism, no less than isolationism or imperialism or power politics may obstruct the paths to international peace." President Truman, in his Navy Day speech on Oct. 27—his major 1945 pronouncement on foreign policy—sounded a similar note. The greatest danger to peace, he stated, was the threat of disillusionment and a loss of faith in the effectiveness of international cooperation. Lest this threat materialize, the President announced that "our American policy is a policy of friendly partnership with all peaceful nations, and of full support for the United Nations Organization."

In order to carry out this stated policy of continued partnership with the other Allies, the United States participated during 1945 in three types of international action: (1) conferences among the American Republics at Mexico City (see U. S. and Latin America) and all the United Nations at San Francisco (see the San Francisco Conference and the United Nations Charter) for the purpose of creating and establishing international machinery designed to maintain peace and security; (2) meetings of the Big Three at Yalta and Potsdam, the first session of the Council of Foreign Ministers at London, and the conference of the Foreign Ministers of Russia, Britain and the United States at Moscow; and (3) sessions of United Nations organizations charged with responsibility for immediate reconstruction tasks and long-range economic and social cooperation.

THE CRIMEA CONFERENCE (YALTA)

One of the chief features of the agreement reached by Roosevelt, Stalin, and Churchill at the Crimea Conference, held at Yalta Feb. 5-12, was the Declaration on Liberated Europe. According to this Declaration, the United States, Russia, and Britain agreed they would henceforth act in concert whenever they intervened politically in the liberated and former Axis satellite countries and would consult with other Allied governments concerned whenever matters of direct interest to them came under consideration.

The Yalta plans for joint Allied action in liberated areas were designed to end the rivalries and disagreements that had arisen among the major Allies as a result of unilateral interventions on their part in various European nations. Poland and Greece, which seemed early in 1945 to be virtually controlled by Russia and Britain respectively, had raised particularly acute problems among the Big Three.

The appearance of "zones of influence" in Europe was directly traceable to the decision made by the Big Three at Teheran in December 1943 whereby specific geographical areas of the German-occupied continent were assigned to the Russian, British, and American armies for the purposes of liberation or occupation. For the U.S.S.R., this arrangement apparently entailed dominance in Finland, Poland, Rumania, Hungary, Bulgaria, and Czechoslovakia, and predominant but not exclusive influence in Yugoslavia. Western Europe, on the other hand, fell into the Anglo-American area of action, and Greece reportedly belonged in the British sphere, while Italy was under predominantly British control, with some American participation. Germany and Austria, located between the two main spheres of influence outlined at Teheran, were to be entered and occupied by the troops of Russia, Britain, the United States, and France. This virtual division of Europe, which was agreed upon at Teheran for military purposes, posed important political problems among the Allies as the German armies were driven back and the great powers discovered that the overlapping of their interests made the existence of exclusive spheres of influence a source of friction among themselves.

At Yalta, President Roosevelt took the initiative in suggesting a plan that would substitute joint Allied action for the unilateral measures of Teheran in tackling the problems of the liberated and former satellite nations and aiding the peoples of Europe "to solve by democratic means their pressing political and economic problems." During the interim period between war and peace the Big Three agreed to intervene jointly in the affairs of liberated nations for four main purposes: (1) to establish conditions of internal peace; (2) to carry out emergency relief measures for distressed peoples; (3) to form broadly representative interim governments pledged to the earliest possible establishment, through free elections, of governments "responsive to the will of the people"; and (4) to facilitate where necessary the holding of such elections. (For Yalta decisions on Germany, see "War in Europe: Last Phase".)

BERLIN CONFERENCE (POTSDAM)

The meeting in Berlin (July 17 to Aug. 2) of Truman, Stalin, and Churchill—the last named succeeded during the Conference by Attlee, head of the new British Labor Government—gave the major Allies another opportunity to carry forward the doctrine of joint responsibility for the settlement of international problems.

At Berlin the main goal was agreement on the outstanding political and economic problems the war had left in its wake in Europe, with some attention to military problems in Asia. In connection with these military discussions, the United States, Britain, and China issued a proclamation to Japan on July 26 outlining surrender terms and, in a reference to the atomic bomb, the warning that "the full application of our military power . . . will mean the inevitable and complete destruction of the Japanese armed forces and just as inevitably the utter devastation of the Japanese homeland."

The chief non-military issue at Potsdam was the treatment of Germany, for previous parleys and diplomatic exchanges had failed to define specifically the nature of Allied policy toward the Reich. (For specific terms of the Potsdam agreement on Germany, see "War in Europe".) In addition to this agreement, the Big Three reaffirmed the Yalta principle that they should assume a common responsibility in helping to reestablish in the liberated and satellite nations of Europe governments broadly representative of democratic elements in the population. President Truman, in his radio report to the nation on the Potsdam Conference, declared that Rumania, Bulgaria, and Hungary, in connection with which particular questions had arisen, "are not to be the spheres of influence of any one power . . . Until these states are reestablished as members of the international family, they are the joint concern of all of us."

The Conference also agreed it was desirable to end "the present anomalous position of Italy, Bulgaria, Finland, Hungary and Rumania" by the conclusion of peace treaties. In order to facilitate the making of these treaties, the Conference established the Council of Foreign Ministers, made up of the foreign ministers of the United Kingdom, the Soviet Union, China, France, and the United States. This body, which was normally to meet in London, was to serve as the continuous meeting-ground of the five principal governments and thus to aid in reaching a common understanding regarding the peace settlements. In drawing up treaties of peace and proposals for territorial settlements in Europe the Council was to be composed of members representing those states which were signatory to the terms of surrender imposed upon the enemy state concerned. For the purpose of the peace settlement for Italy, France was to be regarded as a signatory to the terms of surrender for Italy. Other members were to be invited to participate when matters directly concerning them were under discussion.

FIRST SESSION OF COUNCIL OF FOREIGN MINISTERS (LONDON)

The first meeting of the Council of Foreign Ministers of the U.S.S.R., Britain, the United States, France, and China, created by the Potsdam Declaration, was opened in London Sept. 11 and closed in a stalemate on Oct. 2.

The particular issue on which the meeting broke down was a procedural one. Foreign Commissar Molotov, after agreeing on Sept. 11 that France and China could be present at all sessions, withdrew his consent to this arrangement 11 days later, contending that the Potsdam agreement excluded France and China from discussing treaties with the Axis satellites since they had not been armistice signatories. From the point of view of Russia, the participation of France—which in Moscow's opinion made no important contribution to the defeat of Germany—and of China, a non-European power, was apparently considered unnecessary and undesirable.

Observers suggested that the main reason for the collapse of the conference was the belief on the part of the Russians that they had detected, whether rightly or wrongly, a tendency on the part of Britain and the United States to stand together and of France to side with the western powers. There appeared to be no evidence that Washington and London had had any preliminary understanding, but Russia's suspicions had the result of bringing Britain and the United States closer together during the London meeting, and of effecting a rapprochement between them and France.

Despite the failure of the first session of the Council of Foreign Ministers, none of the Allies seemed to display an inclination to abandon international consultation in favor of strictly independent action. Secretary of State Byrnes, in his radio report to the nation on Oct. 5, admitted that the meeting had been disappointing, but at the same time he declared that it "need not, and should not, deprive us of a second and better chance to get on with the peace."

MOSCOW MEETING OF AMERICAN, BRITISH, AND RUSSIAN FOREIGN MINISTERS

After reaching a stalemate at London, practical collaboration among the major Allies, except through diplomatic channels, ceased for all practical purposes. In an effort to break this impasse, Secretary of State Byrnes proposed that the foreign ministers of Britain, Russia, and the United States meet in Moscow and discuss problems that had arisen in their relationships with each other.

The Moscow Conference of Dec. 16-26 did not achieve agreement on all matters that had brought about controversies among the three great powers. It did, however, result in a compromise on the procedure of peacemaking, thus clearing the way for the negotiation of treaties with Italy and the Axis satellites of eastern Europe. According to this compromise, the peacemaking procedure will have three stages. The first will be the drafting of peace treaties by the United States, Britain, and Russia with Italy (France to participate in this instance), Hungary, Rumania, and Bulgaria; and by Britain and Russia with Finland (the United States did not declare war on Finland). Second, these draft treaties will be submitted to a peace conference which, in addition to the Big Three, as well as France and China, will be attended by "all members of the United Nations which actively waged war with substantial military force against enemy states," this conference to be held not later than May 1, 1946. Third, upon conclusion of this conference and consideration of recommendations, the Big Three (and in the case of the treaty with Italy, also France) will draw up final texts of the peace treaties.

At Moscow, decisions were also reached concerning changes in the governments of Rumania and Bulgaria, which the Western powers considered unsatisfactory. (See "War in Europe") In connection with Far Eastern problems, it was agreed that American control of Japan should be merged into an 11-nation set-up in which the United States, with the U.S.S.R., Britain, and China would have veto power over the formulation of new policies or the modification of those already in force under the Supreme Commander, General Douglas MacArthur, who retained significant powers. The intention to create a four-power trusteeship of the United States, Russia, China, and Britain "for a period of up to five years" for Korea was also announced, and in connection with China, the Big Three asserted, in one of the least specific sections of the Moscow decisions, their common desire "for a unified and democratic China under the National Government, for broad participation by democratic elements in all branches of the National Government and for the cessation of civil strife."

More far-reaching, perhaps, than these political agreements reached at Moscow was the decision of the Big Three to recommend the establishment by the United Nations of a commission to consider problems arising from the discovery of atomic energy and related matters. This commission was to be responsible to the Security Council of the United Nations Organization, and should be composed of one representative from each of the 11 nations on the Council, and Canada (which played an important part in the discovery of the atomic bomb) when that country is not a member of the Security Council.

UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION

Confronted with widespread want in Europe and Asia, the United States distributed emergency relief supplies through three agencies: UNRRA, lend-lease, and the Army.

The United Nations Relief and Rehabilitation Administration, composed of 47 Allied governments and financially supported by 31 countries which had not been invaded by the Axis, gave relief to the peoples of liberated countries in Europe and the Far East who were unable to finance their own immediate basic needs for food, clothing, medical care, public utilities, and transport facilities.

The European activities of this international organization were confined during 1945 to six countries: Greece, Yugoslavia, Albania, Czechoslovakia, Italy, and Poland. In addition to dispensing relief in these countries, UNRRA had the tasks of operating refugee camps in the Middle East and of assembling, caring for, and directing homeward displaced United Nations nationals in Germany and Austria. In the Far East aid was sent to the Philippines, and following the end of the war with Japan, UNRRA set about procuring 800,000 tons of supplies for the initial program of aid to China.

In an attempt to accelerate UNRRA's operations after the end of hostilities, the governing Council of the organization met in London Aug. 7-24 for its third annual meeting. Agreements reached at this conference included: (1) resolution recommending another contribution of 1 per cent of the national income of each of the uninvaded nations belonging to the organization, to raise $1,800,000,000 for 1946 in addition to the original total UNRRA budget of approximately $1,862,000,000; (2) admission of Canada, which was, next to the United States, the largest source of relief supplies, and France to membership on the Central Committee, the body responsible for making policy decisions when the Council is not in session; (3) admission of Denmark and the Ukrainian and Byelo-Russian Soviet Socialist Republics to membership in the Council; (4) aid on a full-scale basis to Italy, which had been granted on a limited basis at the Montreal session of 1944, and classification of Austria, Korea and Formosa as regions which might qualify for relief aid; (5) adoption of a resolution asking supplying countries to insure the prompt and equitable flow of supplies to UNRRA and to make available war surpluses for relief purposes.

One of the most difficult questions arising at the meeting of the Council of UNRRA in London concerned the disposition of displaced persons who were unwilling to return to their homelands. Russia, Poland, Czechoslovakia, and Yugoslavia maintained that UNRRA had no authority to supply food, clothing, or other care to displaced persons who failed to return to their homelands. Britain and the United States, on the other hand, believed these persons should not be forced to return against their will. A compromise was finally reached by means of a resolution to the effect that the matter should go over for the next council meeting, and in the meantime the care of these displaced persons should be carried on by UNRRA. Despite these efforts by the Council to facilitate the work of the organization, three main problems continued to confront UNRRA.

MAIN PROBLEMS CONFRONTING UNRRA

Finances.—Although 31 nations pledged support to UNRRA, the bulk of its budget—$1,350,000,000 was subscribed by the United States, and the final $550,000,000 installment of this amount was not finally voted by Congress until Dec. 17. During the Congressional debate concerning this appropriation, UNRRA encountered considerable criticism, generally based on the charges that the organization was inefficient and that political favoritism had influenced the distribution of relief supplies. Strong appeals for support of UNRRA were made, however, by General Eisenhower and Herbert H. Lehman, Director-General of UNRRA, on the ground that the organization was the only body prepared to carry out relief tasks. Despite Congressional delay on the 1945 appropriation, President Truman asked for another appropriation of $1,350,000,000 for 1946, declaring that the United States should under no circumstances default in its support of the organization.

Supplies.—Even when UNRRA had funds for purchases, it was sometimes unable to buy suitable supplies, and shipping as well as transportation difficulties along this line were considerably increased by the fact that the war in Europe and the Far East added to the problems of distributing such supplies as were secured. UNRRA's difficulties along this line were considerably increased by the fact that the war in Europe lasted a number of months longer than Allied military leaders had generally anticipated, while the war in the Far East was shorter than expected. Because of the continuance of the European war, shipping and relief supplies for the continent remained extremely scarce until V-E Day, and the prolongation of fighting caused a greater need for aid than UNRRA's plans had originally called for. Then as UNRRA was accelerating its activities in the European area, the sudden surrender of Japan made it imperative that the organization begin the immediate implementation of its plans for assisting China and the Far East.

Authority.—UNRRA was not only restricted to a relatively small number of liberated countries, but in those nations where it operated, its authority was restricted by the provision that relief supplies should be distributed by local political officials. This provision, which had been adopted in view of the fear of local régimes of interference, did not, however, entirely dispel fears on the part of local authorities that relief would be used to strengthen political rivals. In eastern Europe UNRRA gained admission rather tardily because of Russia's fears that relief might be used to bolster anti-Soviet elements in the area.

LEND-LEASE

Lend-lease, dispensed by the Foreign Economic Administration, continued during the remaining months of the war to give aid to countries where civil order was deemed necessary for American military operations or redeployment. Through this channel, supplies of various kinds were sent to Britain, Russia, France, Belgium, the Netherlands, Norway, Australia, and China.

According to the Twentieth Report by the President to Congress on lend-lease operation, covering the period ended June 30, 1945—by which time most of the tasks of lend-lease were completed—the United States had given $31,368,909,000 worth of lend-lease aid between March 31, 1941 and July 1, 1945. By the same date, reverse lend-lease had reached $5,600,364,000.

In lend-lease, the United States had furnished the United Kingdom $13,498,748,000 and received $3,796,883,000 in reverse; furnished the U.S.S.R. $9,128,875,000, received $2,139,000 in reverse; furnished North, Central, and South America $976,603,000 (including $618,072,000 to Canada); furnished Africa, the Middle East, and the Mediterranean area $3,334,656,000; furnished China $397,000,000, received $3,672,000 in reverse; furnished India $2,033,385,000, received $516,713,000 in reverse; furnished Australia $1,169,260,000, received $791,282,000 in reverse; furnished New Zealand $209,438,000, received $189,003,000 in reverse; furnished other countries $1,553,170,000 (including $1,205,000,000 to France and French Africa, and received approximately $200,000,000 from France from D-Day until Jan. 31, 1945 in reverse).

The formal termination of lend-lease was announced by President Truman on Aug. 21, at which time he notified the Allied governments concerned to take over through purchase some $2,000,000,000 worth of non-munitions and other finished goods already contracted for in the United States, and to negotiate, if they desired, for another $1,500,000,000 worth in stockpiles throughout the world. The effect of the sudden halt of lend-lease was felt most keenly in Britain, France, Belgium, and other countries that had formerly been mainly dependent on large lend-lease shipments of food.

LOANS

In an attempt to find a substitute for lend-lease as a means of procuring food and other essential goods from the United States, Britain opened negotiations during September for a loan, which was finally agreed upon by the Anglo-American negotiations on Dec. 6, subject to approval by Parliament and Congress. Under the terms of the proposed agreement, the United States would extend to Britain a "line of credit" amounting to $3,750,000,000 and, in addition to liquidating lend-lease obligations amounting to $25,000,000,000, a loan of $650,000,000 at two per cent interest, will be granted for settling remaining lend-lease claims owed to the United States. Whether or not the total amount of $3,750,000,000 is taken up within five years, repayment to extend over 50 years will then begin. The agreement also binds Britain to adjust some of its external financial obligations by permitting the conversion of sterling funds now blocked in London, so that the owners of these funds may use them for purchases elsewhere than in Britain.

Likewise, France secured a $440,000,000 loan from the United States shortly after V-J Day in order to finance the purchase of such materials as had been previously approved as lend-lease items, and an additional $500,000,000 credit from the export-import bank was subsequently negotiated. Both loans were on terms of 2⅜ per cent interest over a 30-year period.

JEWISH REFUGEES IN EUROPE

Recognizing the fact that the hardships of European Jews had not ended with the disappearance of Hitler, President Truman appointed a mission, headed by Earl G. Harrison, to inquire into the condition and needs of displaced persons in western Europe and in western Germany, with particular reference to Jewish refugees who might be stateless or non-repatriable. Harrison, in his report, released Sept. 29, declared that many Jewish displaced persons and other non-repatriables were still living behind barbed-wire fences in guarded camps characterized by "unsanitary and generally grim conditions." He concluded that "for reasons that are obvious," most homeless Jews wanted to leave Europe at once, and that most of them wished to be evacuated to Palestine, "just as other national groups are being repatriated to their homes."

In response to the Harrison report, President Truman proposed to Prime Minister Attlee on Aug. 31 that Palestine be opened to 100,000 European Jews, despite the fact that the British White Paper of 1939 called for cessation of immigration on Oct. 26. Attlee, on Sept. 16, replied by opposing this suggestion but urging the creation of a joint Anglo-American policy toward Palestine.

When Arab leaders indicated that they considered President Truman's suggestion incompatible with the statement by President Roosevelt in a letter to King Ibn Saud of Saudi Arabia early in April to the effect that the United States would make no decisions concerning Palestine without consulting both the Arabs and the Jews, Secretary of State Byrnes published Roosevelt's letter on Oct. 18 and restated the Roosevelt policy. In an apparent attempt to reconcile the Roosevelt policy, which some military officials considered important to American security, in view of the valuable oil concessions which Ibn Saud had made to American companies, and at the same time find a home for a large number of homeless European Jews, the United States formally assumed at least a limited responsibility with Britain for the solution of the Palestine problem. On Nov. 13, Washington and London agreed that their two governments should cooperate in officially surveying before 1946, the contribution Palestine could make toward alleviating the distress of homeless Jews of post-war Europe.

FOOD AND AGRICULTURE ORGANIZATION (FAO)

On July 31, 1945 the United States formally adhered to the constitution of the Food and Agriculture Organization, which had grown out of discussions and negotiations begun at the United Nations Food and Agriculture Conferences in Hot Springs, Va. in 1943 and 1944. With the signing of the Charter at the first meeting of the FAO in Quebec Oct. 16-Nov. 1, the first of the permanent international functional authorities, established after the Second World War, came into being. Although the Soviet Union had not yet joined the organization, Moscow sent observers to the conference.

The purpose of the FAO is to expand and improve agricultural production to a point that will not only guarantee an adequate price for the farmers of the world but will provide ample food supplies to raise the world level of nutrition. To this end, the FAO intends to improve methods of agricultural production and combat economic nationalism by promoting international exchange of foodstuffs on a wide scale.

The three main working functions of the FAO are: (1) collection analysis, interpretation, and dissemination of information relating to nutrition, food and agriculture; (2) promotion, and in appropriate cases, recommendation of national and international action with respect to improving the processing, marketing, and distribution of food and other agricultural products; and (3) the assistance of individual governments by obtaining technical assistance that they request in order to fulfil obligations they assume in accepting recommendations of the FAO.

The fact that the FAO lacks any power beyond persuasion in overcoming political or economic opposition to its proposals was underlined by President Roosevelt in his message to Congress, on March 26, 1945, transmitting the first report of the Interim Commission for Food and Agriculture. "In becoming a member of the Food and Agriculture Organization," he declared, "we will retain complete freedom of action in determining our national agricultural policies."

Despite its limited powers, the FAO has a broader scope than that of any previous agency operating in this field. The International Institute of Agriculture at Rome, established in 1905, was restricted to research on agricultural problems and did not concern itself with the question of improving nutrition. Likewise, the International Labor Organization, which has a committee specifically concerned with agriculture, had not concerned itself with the dual task of improving agriculture and nutrition.

UNITED NATIONS EDUCATIONAL, SCIENTIFIC, AND CULTURAL ORGANIZATION (UNESCO)

Following the discussion of the American suggestion at the Conference of Allied Ministers of Education in 1944, that a United Nations Organization be established to deal with educational and cultural problems in the reconstruction period, a large number of Allied nations reached agreement during 1945 on a constitution for such an organization. At the third conference of the International Education Assembly, in New York on April 16, delegates from 34 of the United Nations adopted a resolution calling upon representatives to the forthcoming San Francisco Conference on United Nations Organization to establish a world office of education.

The governments of the United States, United Kingdom, and U.S.S.R. approved, on April 24, a proposal made by the Government of China that the Economic and Social Council of the UNO "should specifically provide for the promotion of educational and other forms of cultural cooperation," among the tasks that the Economic and Social Council was to fulfil.

Within the framework of the new United Nations Charter, the Conference of Allied Ministers of Education thereupon made draft proposals for an Educational, Scientific, and Cultural Organization of the United Nations, and the resulting constitution was signed by 43 United Nations (not including the U.S.S.R.) at a conference held in London Nov. 1-16. The constitution will come into force when it has been ratified by 20 of its signatories, and Paris will be its permanent seat.

According to its constitution, the UNESCO is "dedicated to the proposition that the free and unrestricted education of the peoples of the world, and the free and unrestricted exchange among them of ideas and knowledge are essential to the advancement of human welfare and to the preservation of security and peace." The Organization is to recommend such international agreements as may be necessary to promote the free flow of ideas among nations and to aid the member nations, at their request, to advance the ideal of equality of educational opportunity by suggesting educational methods best suited to this end.

PROVISIONAL INTERNATIONAL CIVIL AVIATION ORGANIZATION

Because of continued disagreement as to whether the International Civil Aviation Council, proposed by the Chicago Civil Aviation Conference in 1944, should have strong regulatory powers as urged by the United Kingdom, or merely technical and advisory powers, as supported by the United States, and a majority of the countries represented at Chicago, none of the documents drawn up in 1944, with the exception of the interim agreement, obtained sufficient ratifications during 1945 to become operative.

In the absence of international understanding on civil aviation, the United States signed during 1945 bilateral agreements with seven countries providing for freedom of pickup. Considerable pressure for establishment of a workable and useful international civil aviation organization nevertheless continued.

INTERNATIONAL FUND AND BANK

The Bretton Woods plan for an international fund and bank had, by the end of 1945, been signed by 28 nations, including the United States (July 31), China, Britain and France. There was no indication of what Russia's action would be. The Articles of Agreement required countries responsible for 65 per cent of the capital to be paid into the Bank and Fund to adhere by Dec. 31, 1945, and a sufficient number had done so.

INTERNATIONAL LABOR ORGANIZATION

The International Labor Organization, created by the Versailles Treaty and joined by the United States in 1934, voted at its 27th session in Paris during November to change its constitution to facilitate the agency's entrance into the group of organizations associated with the UNO. The move in this direction was complicated, however, by the opposition of the U.S.S.R. to the organization and the fact that some ILO members, as neutrals during the Second World War, were not eligible for admission to the UNO.

THE MARSHALL REPORT AND MILITARY TRAINING

In his biennial report to the Secretary of War, released to the public Oct. 10, General George Marshall traced the victorious advance of the United States sea, air, and land forces, together with those of the other Allies, in a period during which, he declared, it was more clearly within the power of the United States "to give definite guidance for our course into the future of the human race," than at any previous time.

Following a discussion of the strategy of the war and the efforts exerted to implement the overall plans, General Marshall turned to a consideration of means for providing "a reasonable guarantee for future generations against the horrors and colossal waste of war as well as security for that freedom we recently left to the hazard of mere hope or chance."

Such a reasonable guarantee, he concluded, could best be found in a plan for peacetime universal military training for a citizen army. Declaring that the United States had heretofore "ignored the hard realities of world affairs" and been purely idealistic, he recommended that all young men should undergo a period of military training and be available for service when the nations in jeopardy under such conditions as might be directed at that time by Congress. General Marshall's suggestion touched off a heated debate in Congress and throughout the country on the utility and desirability of universal peacetime military training. No official decision was reached by the end of 1945.

SAN FRANCISCO CONFERENCE AND UNO CHARTER

By Winifred Nelson Hadsel
Research Associate, Foreign Policy Association

COMPOSITION OF THE CONFERENCE

The delegates of the 50 United Nations at war with either Germany or Japan or both met at San Francisco April 25-June 26, 1945, and drew up the United Nations Charter providing for an international security organization. The decision to hold the conference at San Francisco had been made by the Big Three at Yalta the preceding winter, and it proved a good one. The movement of troops and matériel from this west coast city to the Pacific theater of war served as a constant reminder to the delegates of the need to proceed rapidly in order to complete their task before the war ended.

The choice of an American city as the scene for the conference seemed to emphasize one of the notable trends observed at the sessions—the predominance of non-European countries. Although Europe has been the stage for one of the decisive phases of the war against the Axis, only Holland, Belgium, Luxemburg, Norway, Czechoslovakia, Yugoslavia, Greece, and Turkey were present to represent the small nations of Europe. Denmark was invited to become one of the United Nations at the close of the conference. Sweden, Switzerland, Spain, Portugal, and Eire were absent because they had not declared war on the Axis. Finland, Hungary, Rumania, Bulgaria, and Italy were absent because they had been German satellites. Poland was absent because the Big Three had at that time not yet reached agreement on the composition of its government. Those European representatives who were present, however, were able to redress their numerical weakness by force of their abilities and experience in international negotiations. Among the most prominent European delegates were Foreign Minister Paul-Henri Spaak of Belgium, Foreign Minister John Sofianopoulos of Greece, and Foreign Minister E. N. Van Kleffens of the Netherlands.

Among the European representatives at the conference, particular importance naturally attached to the French delegation, headed by Foreign Minister Georges Bidault. At first, however, it was not clear whether France would act as the champion of the rights of the small nations against the strongest powers, or attempt to seek to return to great-power status. After some uncertainties, Foreign Minister Bidault opted for the latter course, and during the sessions he succeeded not only in having France admitted to the ranks of the Big Five, but in being seated as a permanent member of the Security Council as soon as it came into existence rather than "in due course," as the Dumbarton Oaks Conference had proposed.

PREDOMINANT RÔLE OF THE BIG THREE

Important though leading delegates from the smaller powers were in shaping the decisions reached by the conference, the Big Three—United States, Russia, and Britain—played the major rôle. The concepts held by these three nations as to the best approach to international security were, therefore, of great importance. Foreign Commissar Vyacheslav M. Molotov, who headed the Russian delegation, took the view that the most significant aspect of the proposed international organization was its effective authority, rather than its responsibility, and he stressed the need for giving the new organization adequate military forces that could be used promptly against an aggressor. Arguments about the rights of the small nations, he contended, should not be permitted to obscure the fact that the great powers had borne the burdens of the war and would have to be the ones to preserve peace in the postwar period. Accordingly, he insisted on a strict interpretation of the right of the Big Five to veto any proposed action by the Security Council.

By contrast, British Foreign Secretary Anthony Eden declared that the great powers not only should support international organization for security but set up standards of international conduct and observe them in relation to other nations. The concept of the responsibilty of the great powers was also stressed by China, represented by Foreign Minister T. V. Soong, who pleaded for the creation of legal order and justice as well as peace and security.

The United States delegation attempted to steer a middle course between the great-power authoritarianism advocated by Russia, and the domination of the proposed international organization by the numerically superior weaker nations, whose demands for equality of rights did not rest on ability to accept equality of responsibility. In addition to Secretary of State Edward R. Stettinius, who headed the delegation, the United States representatives were Senators Vandenberg and Connally and Commander Harold E. Stassen. The inclusion in the delegation of two Senators and two Republicans (Vandenberg and Stassen) marked an effort on the part of the Administration to ensure Senatorial and bi-partisan support for the work of the conference.

DEBATE ON THE VETO POWER

The most important debates at the conference centered around the question of voting procedure in the Security Council, to consist of the United States, Russia, Britain, France, and China as permanent members and six non-permanent members to be elected from the other United Nations. The question of voting in the Council was of such great importance that the Dumbarton Oaks Conference had left it open, merely stating that this problem was "still under consideration," and the Big Three had considered it at the Crimea Conference in February 1945. At Yalta President Roosevelt, Prime Minister Winston Churchill, and Marshal Joseph Stalin agreed on a voting formula which was announced by the United States government on March 5.

According to the Yalta voting formula, a distinction was made between two types of questions on which the Security Council might vote—procedural decisions, and decisions on all other matters, sometimes described subsequently as "substantive" questions. On procedural questions, such as the adoption or alteration of rules of procedure, decisions were to be reached by an affirmative vote of any seven members, and did not have to include any particular number of the Big Five. On all other matters, however, decisions were to be reached by an affirmative vote of seven members, and these seven members had to include all the Big Five. This meant that any one of the Big Five could, on a "substantive" matter, prevent a decision by declining to vote in the affirmative. This is what is known as the "veto power" of the United States, Russia, Britain, France, and China in the Security Council.

The middle and small nations made it clear that they would have preferred to see the Big Five abandon their veto power over enforcement action by the Security Council. At the same time, however, these nations conceded the fact that the Big Five had reasons for taking the position they did on this issue, particularly since they would have to supply the great bulk of the military and industrial forces in undertaking action against an aggressor. What the "Little 45" at the conference did fight for, however, was to remove all other matters from the scope of the Big Five veto. In this connection, they were particularly eager to prevent the Big Five from vetoing discussion of any dispute, arguing that restrictions on the right of discussion would establish complete "great power dictatorship."

A tense moment accordingly developed at the conference when Russia insisted that the Big Five should have the right to veto, not only investigation of any dispute and the right to take enforcement action with respect to it, but also to the discussion of any dispute at any stage. In opposition to this view, nearly all the other delegations, including those of the United States and Britain, took the view that all members of the Security Council should be free to discuss any dispute threatening the maintenance of international peace and security. The resulting impasse on this question was finally broken, after prolonged negotiation in San Francisco and a direct appeal to Marshal Stalin through Harry Hopkins, who was in Moscow on a special mission for the purpose of settling the question of the Polish régime. Stalin instructed the Russian delegation to abandon its request for a veto over discussion of international disputes and to show a "conciliatory" attitude "in the interests of the success of the conference." As a result, the Big Five issued a statement declaring that "no individual member of the Council can alone prevent consideration and discussion by the Council of a dispute or situation" brought before the Security Council by any nation.

As a result of the veto power of each member of the Big Five in all questions of enforcement action by the Security Council, it is clear that the UNO might operate to prevent wars between small nations, but not to prevent wars in which any one of the Big Five is involved. If, in other words, any threat of war should come from one of the Big Five, the question of whether the Security Council would be adequate to prevent it or cope with it would be seriously raised. The assumption on which the entire Charter rests remains that which underlay the Dumbarton Oaks proposals —that the wartime close-knit alliance of the major Allied powers can be carried over into the postwar period and made the basis for world security.

CHANGES IN DUMBARTON OAKS PROPOSALS

The conference was a hard-working one, and the delegates of the assembled nations, grouped into four main commissions—General Provisions, General Assembly, Security Council, and Judicial Organization—subdivided in turn into 12 committees, labored to produce not only a security organization to check aggression once it had begun but to alleviate and eventually eliminate the basic causes of wars among nations. The representatives at the conference used the proposals made by the Dumbarton Oaks Conference the preceding year as their working draft, but in the course of their deliberations they succeeded in broadening and liberalizing these basic proposals in certain respects.

CONSIDERATION FOR JUSTICE AND HUMAN WELFARE

The Dumbarton Oaks document had been criticized in a number of quarters as an almost exclusively military security arrangement, with little or no consideration for justice and human welfare. In the eyes of the small nations and important sectors of public opinion in Britain and the United States, this preoccupation of the organization with the collective use of military force to prevent acts of aggression might lead to a "peace" that was merely order imposed by force. In an effort to overcome this short-coming, the San Francisco Conference adopted a preamble to the Charter that listed matters which had been left out of the Dumbarton Oaks proposals—human rights, the dignity and worth of human beings, the equal rights of men and women and of nations large and small, justice and respect for obligations arising from treaties, and the promotion of social progress and better standards of living. Likewise, Chapter I of the Charter, concerned with the principles and purposes of the organization, was broadened to include recognition of the principle that the international organization should be concerned not only with peace but with peace "in conformity with the principles of justice and international law."

RÔLE OF THE GENERAL ASSEMBLY BROADENED

One of the most important changes in the Dumbarton Oaks proposals secured by the small and middle nations at San Francisco concerned the rôle of the General Assembly. In the original Dumbarton Oaks plan, the Assembly was slated to be little more than a debating society, for it did not have the right to call the attention of the Security Council to situations which it considered likely to endanger international peace and security. Under the terms of the Charter as finally formulated, however, the General Assembly became a deliberative body that is to keep a close and continuous check on the activities of the Security Council.

The Charter provides that the General Assembly shall have the right to discuss "any questions or any matters within the scope of the present Charter" and may make recommendations with regard to any such questions to the state or states concerned or to the Security Council, or to both. Any such question on which action is necessary shall be referred to the Security Council by the General Assembly either before or after discussion. Moreover, it is provided that "the General Assembly shall receive and consider annual and special reports from the Security Council; these reports shall include an account of the measures that the Security Council has decided upon or taken to maintain international peace and security," thus preventing the possibility that the Security Council might pigeonhole matters threatening international peace and security, blocking further action on these matters by the Assembly.

In addition to its rôle in connection with discussions of matters affecting international peace and security, the General Assembly, according to the Charter, shall initiate studies and make recommendations in connection with international economic, social, cultural, educational, and health problems.

ECONOMIC AND SOCIAL COUNCIL STRENGTHENED

While the Dumbarton Oaks proposals had left the functions of the Economic and Social Council, which is to act under the authority of the General Assembly, rather sketchy and vague, the Charter defined them more carefully and made the Council one of the "principal organs" of the UNO, along with the Security Council, General Assembly, Secretariat, Trusteeship Council, and International Court of Justice. In this way the San Francisco Conference emphasized its attempts to make the UNO an instrument to prevent wars through peaceful adjustment of social and economic problems, as well as to halt aggressions once they had begun.

Among the objectives toward which the Economic and Social Council should work, according to the Charter, are the "creation of conditions of stability and well-being which are necessary for peaceful and friendly relations among nations." Among these objectives are higher standards of living, full employment and conditions of economic and social progress, solutions of international economic, social, health, and related problems, and universal respect for human rights and fundamental freedoms. The Council is empowered not only to carry out the recommendations of the General Assembly but to make recommendations on its own initiative and to make and initiate studies with respect to problems within its province.

TRUSTEESHIPS FOR DEPENDENT PEOPLES

While the Dumbarton Oaks proposals did not mention the problem of dependent peoples, the Charter contains a section providing for the establishment of an international trusteeship system for the administration and supervision of such territories, to be known as trust territories, as may be placed thereunder by subsequent individual agreements. The basic objectives of the trusteeship system are to promote the political, economic, social, and educational advancement of the inhabitants of the trust territories, and their progressive development toward self-government or independence as may be appropriate to the particular circumstances of each territory and its peoples and the freely expressed wishes of the peoples concerned, and as may be provided by the terms of each trusteeship agreement.

According to the terms of the Charter, there should be three main categories of territories under the trusteeship system: (1) territories now held under mandate; (2) territories which may be detached from enemy states as a result of the war; and (3) territories voluntarily placed under the system of states responsible for their administration. Which particular territories should fall into these categories included in the Charter was left as a matter for subsequent discussion.

It should be noted that the Charter's declaration of general principles concerning non-self-governing areas entails no change in the status of the various powers' colonies except such as these powers may voluntarily undertake to make. In fact, it was precisely because the Charter's provision for the creation of trusteeships was vague that colonial nations like Britain, France, the Netherlands, and Belgium found it acceptable. Moreover, the fact that a division of opinion existed within the United States, on the advisability of accepting the trusteeship principle, resulted in the establishment of a distinction between "strategic" and "non-strategic" areas to be held as trusts. On the one hand, the Navy and War Departments wanted outright annexation of Pacific islands conquered by American forces, and the State Department wished to establish general principles to be observed by all nations in the administration of dependent peoples. Until a definite compromise between these two points of view had been found, the United States wished to have the provision for trusteeship remain flexible and general.

As a result of uncertainties such as these, moreover, the Charter provided that the trusteeship arrangement for each territory to be placed in trust should be agreed upon by "the states directly concerned," a phrase which clearly left the door open for countries receiving territories detached from enemy states (*e.g.* the United States or Russia when they received Japanese-mandated or Japanese-owned islands) to abstain from placing them under the trusteeship system if they should so desire.

The trusteeship system set forth in the Charter was, therefore, left vague in several important respects and was marked by obvious weaknesses. As in the case of other major provisions of the Charter, however, it established principles and methods which could gradually be used to deal with controversial international problems.

RELATIONSHIP OF REGIONAL AND COLLECTIVE SECURITY ESTABLISHED

The Dumbarton Oaks proposals had left the question of the relationship of regional and collective security measures undetermined, and this problem had been increasingly confused during the final phases of the war by the conclusion of a number of bilateral or regional security arrangements. Two formulas were worked out at San Francisco which acknowledged the existence of regional security measures during the period of transition during which the United Nations Organization should establish a more permanent world-wide system of security.

First, to meet the special situation

prevailing in Europe, where Russia had already concluded bilateral pacts with France, Britain, Czechoslovakia, Poland and Yugoslavia as a safeguard against the renewal of German aggression, it was provided that security agreements directed against former enemy states could be used "against renewal of aggressive policy on the part of any such state . . . until such time as the (United Nations) organization may, on the request of the Governments concerned, be charged with the responsibility for preventing further aggression by such a state."

Second, to recognize the demand of the Latin American countries to take measures of self-defense against one of their number resorting to aggression, it was provided that nothing in the terms of the Charter should "impair the inherent right of individual or collective self-defense if an armed attack occurs against a member of the United Nations, until the Security Council has taken the measures necessary to maintain international peace and security."

The determination of the United States and the Latin American countries to restore hemisphere solidarity within the frame-work of the Charter, even at the risk of seeming to appease a Fascist government in Buenos Aires, was revealed in the conflict over the admission of Argentina. Although Russia opposed this measure, many Latin Americans replied that they had acquiesced in the granting of two votes to Bielorussia and the Ukraine, component republics of the U.S.S.R., only because the United States had made it clear to them that, in return, Argentina would be admitted.

THE INTERNATIONAL COURT OF JUSTICE

At San Francisco the question of whether the Permanent Court of International Justice (commonly called the World Court) should be retained or a new one established aroused lively discussion. Although there was agreement that the old Court had rendered effective service and had a good record, it was decided—chiefly because certain states belonging to this Court were ineligible for membership in the UNO—to form a new court. In order to retain the traditions and precedents of the World Court, however, the Charter established specific links between the new International Court of Justice and its immediate predecessor.

Article 7 of the Charter provides that the International Court of Justice shall be one of "the principal organs of the United Nations." Instead, therefore, of occupying the related but separate position which the old Permanent Court of International Justice held in the League of Nations system, the new Court is an integral part of the United Nations Security Organization. The somewhat aloof position of the World Court from the League was the result of a deliberate decision, strongly advocated by Elihu Root, that the separation of the Court was necessary to its judicial independence. The experience of the past quarter of a century demonstrated, however, that the connections between the Court and the League were mutually beneficial, and the San Francisco Conference took cognizance of this fact.

The jurisdiction of the new Court was discussed at great length by the San Francisco conferees. The smaller states tended to favor "compulsory jurisdiction," while the U.S.S.R. delegation was unequivocally opposed to this suggestion, and the United States indicated a desire to see obligatory jurisdiction established as "the rule." It was pointed out, however, that the United States Senate had shown reluctance in the past about the acceptance of an international court, and it was suggested that a provision to this effect might endanger ratification of the Charter as a whole. It was noted, nevertheless, that the very existence of an international court to which both the United States and Russia, which had not been members of the World Court, marked an advance toward the establishment and maintenance of an international system of justice. Moreover, if either of these nations should in the future be willing to extend the powers of the Court, Article 36 of the Statute of the Court provides that the signatories may at any time declare that they recognize as compulsory the jurisdiction of the Court in all legal disputes concerning "(a) the interpretation of a treaty; (b) any question of international law; (c) the existence of any fact which, if established, would constitute a breach of an international obligation; (d) the nature or extent of the reparation to be made for the breach of an international obligation."

AMENDMENT AND PROVISIONS FOR WITHDRAWAL FROM UNO

As far as changes in UNO are concerned, the Charter provides that, if a general conference to review the document has not been held before the tenth annual session of the General Assembly, a proposal to that effect shall be placed on the agenda of that session. A general conference to review the Charter can be summoned at any time by a two-thirds vote of the General Assembly (in the tenth year and after by a majority) and by a vote of any seven members of the Security Council. Upon receiving a two-thirds vote of the conference any proposed amendment of the Charter must then be ratified by two-thirds of the members of the United Nations, including all the permanent members of the Security Council. Each of the Big Five, therefore, has the power to veto a proposed amendment to the Charter.

Provisions for the withdrawal of member states from the UNO are not actually included in the Charter. However, an official interpretative report included in the record of the San Francisco Conference indicated that it was understood that members might withdraw under at least three conditions: (1) if, in their opinion, UNO failed to maintain peace with justice; (2) if the organization adopted amendments unacceptable to the withdrawing state; (3) if amendments adopted by a general conference of the United Nations failed to come into effect because of the veto by any one of the Big Five.

RATIFICATION

The Charter was to come into force upon the deposit of ratifications with the Government of the United States by the Big Five and by a majority of the other signatories. On June 26, 50 nations signed the Charter, and Poland subsequently became the fifty-first signatory, raising the total number of ratifications required to 29. On July 2, President Truman submitted the Charter to the Senate, and on July 28 it received a favorable vote of 89 to 2. By Oct. 24, the twenty-ninth instrument of ratification had been received, and the Charter went into effect on that date.

Ratification of the Charter marked, however, only the first and easiest step toward the implementation of the Charter. Several points particularly remained to be worked out before even the limited amount of international organization envisaged by the Charter could come into effect—the establishment of trusteeships for non-self-governing peoples, the specification of the armed forces of the Security Council, and the scope of authority the various delegates to the Security Council would be permitted by their respective nations to exercise in voting for military action against an aggressor.

From the very moment UNO came into existence, however, it was evident that the success of the organization would hinge, not on this or that technical point or the creation of additional international machinery. Because of the veto power belonging to each of the Big Five in the Security Council, the only possibility that this new attempt to maintain peace could succeed lay in the possibility that the great powers, particularly the United States and Russia, could accommodate their basic interests.

TEXT OF THE CHARTER OF THE UNITED NATIONS

We The Peoples of the United Nations Determined

—to save succeeding generations from the scourge of war, which twice in our lifetime has brought untold sorrow to mankind, and
—to reaffirm faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women and of nations large and small, and
—to establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be maintained, and
—to promote social progress and better standards of life in larger freedom,

And For These Ends

—to practice tolerance and live together in peace with one another as good neighbors, and
—to unite our strength to maintain international peace and security, and
—to insure, by the acceptance of principles and the institution of methods, that armed force shall not be used, save in the common interest, and
—to employ international machinery for the promotion of the economic and social advancement of all peoples,

Have Resolved to Combine Our Efforts to Accomplish These Aims.

Accordingly, our respective governments, through representatives assembled in the city of San Francisco, who have exhibited their full powers found to be in good and due form, have agreed to the present charter of the United Nations and do hereby establish an international organization to be known as the United Nations.

CHAPTER I

PURPOSES AND PRINCIPLES

Article 1

The purposes of the United Nations are:

1. To maintain international peace and security, and to that end: to take effective collective measures for the prevention and removal of threats to the peace, and for the suppression of acts of aggression or other breaches of the peace, and to bring about by peaceful means, and in conformity with the principles of justice and international law, adjustment or settlement of international disputes or situations which might lead to a breach of peace;

2. To develop friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples, and to take other appropriate measures to strengthen universal peace;

3. To achieve international cooperation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion; and

4. To be a center for harmonizing the actions of nations in the attainment of these common ends.

Article 2

The organization and its members, in pursuit of the purposes stated in Article 1, shall act in accordance with the following principles:

1. The organization is based on the principle of the sovereign equality of all its members.

2. All members, in order to ensure to all of them the rights and benefits resulting from membership, shall fulfill in good faith the obligations assumed by them in accordance with the present charter.

3. All members shall settle their international disputes by peaceful means in such a manner that international peace and security, and justice, are not endangered.

4. All members shall refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the purposes of the United Nations.

5. All members shall give the United Nations every assistance in any action it takes in accordance with the present charter, and shall refrain from giving assistance to any state against which the United Nations is taking preventive or enforcement action.

6. The organization shall ensure that states which are not members of the United Nations act in accordance with these principles so far as may be necessary for the maintenance of international peace and security.

7. Nothing contained in the present charter shall authorize the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state or shall require the members to submit such matters to settlement under the present charter; but this principle shall not prejudice the application of enforcement measures under Chapter VII.

CHAPTER II

MEMBERSHIP

Article 3

The original members of the United Nations shall be the states which, having participated in the United Nations Conference on International Organization at San Francisco or having previously signed the Declaration by United Nations of January 1, 1942, sign the present charter and ratify it in accordance with Article 110.

Article 4

1. Membership in the United Nations is open to all other peace-loving states which accept the obligations contained in the present charter and, in the judgment of the organization, are able and willing to carry out these obligations.

2. The admission of any such state to membership in the United Nations will be effected by a decision of the General Assembly upon the recommendation of the Security Council.

Article 5

A member of the United Nations against which preventive or enforcement action has been taken by the Security Council may be suspended from the exercise of the rights and privileges of membership by the General Assembly upon the recommendation of the Security Council. The exercise of these rights and privileges may be restored by the Security Council.

Article 6

A member of the United Nations which has persistently violated the principles contained in the present charter may be expelled from the organization by the General Assembly upon the recommendation of the Security Council.

CHAPTER III

ORGANS

Article 7

1. There are established as the principal organs of the United Nations: a General Assembly, a Security Council, an Economic and Social Council, a Trusteeship Council, an International Court of Justice, and a Secretariat.

2. Such subsidiary organs as may be found necessary may be established in accordance with the present charter.

Article 8

The United Nations shall place no restrictions on the eligibility of men and women to participate in any capacity and under conditions of equality in its principal and subsidiary organs.

CHAPTER IV

THE GENERAL ASSEMBLY

Composition

Article 9

1. The General Assembly shall consist of all the members of the United Nations.

2. Each member shall have not more than five representatives in the General Assembly.

Functions and Powers

Article 10

The General Assembly may discuss any questions or any matters within the scope of the present charter or relating to the powers and functions of any organs provided for in the present charter, and, except as provided in Article 12, may make recommendations to the members of the United Nations or to the Security Council or to both on any such questions or matters.

Article 11

1. The General Assembly may consider the general principles of cooperation in the maintenance of international peace and security, including the principles governing disarmament and the regulation of armaments, and may make recommendations with regard to such principles to the members or to the Security Council or to both.

2. The General Assembly may discuss any questions relating to the maintenance of international peace and security brought before it by any member of the United Nations, or by the Security Council, or by a state which is not a member of the United Nations in accordance with Article 35, paragraph 2, and, except as provided in Article 12, may make recommendations with regard to any such questions to the state or states concerned or to the Security Council or to both. Any such question on which action is necessary shall be referred to the Security Council by the General Assembly either before or after discussion.

3. The General Assembly may call the attention of the Security Council to situations which are likely to endanger international peace and security.

4. The powers of the General Assembly set forth in this article shall not limit the general scope of Article 10.

Article 12

1. While the Security Council is exercising in respect of any dispute or situation the functions assigned to it in the present charter, the General Assembly shall not make any recommendation with regard to that dispute or situation unless the Security Council so requests.

2. The Secretary-General, with the consent of the Security Council, shall notify the General Assembly at each session of any matters relative to the maintenance of international peace and security which are being dealt with by the Security Council and shall similarly notify the General Assembly at each session of any matters relative to the maintenance of international peace and security which are being dealt with by the Security Council and shall similarly notify the General Assembly, or the members of the United Nations if the General Assembly is not in session, immediately the Security Council ceases to deal with such matters.

Article 13

1. The General Assembly shall initiate studies and make recommendations for the purpose of:

A. Promoting international cooperation in the political field and encouraging the progressive development of international law and its codification;

B. Promoting international cooperation in the economic, social, cultural, educational, and health fields, and assisting in the realization of human rights and fundamental freedoms for all without distinction as to race, sex, language, or religion.

2. The further responsibilities, functions, and powers of the General Assembly with respect to matters mentioned in paragraph 1 (B) above are set forth in Chapters IX and X.

Article 14

Subject to the provisions of Article 12, the General Assembly may recommend measures for the peaceful adjustment of any situation, regardless of origin, which it deems likely to impair the general welfare or friendly relations among nations, including situations resulting from a violation of the provisions of the present charter setting forth the purposes and principles of the United Nations.

Article 15

1. The General Assembly shall receive and consider annual and special reports from the Security Council; these reports shall include an account of the measures that the Security Council has decided upon or taken to maintain international peace and security.

2. The General Assembly shall receive and consider reports from the other organs of the United Nations.

Article 16

The General Assembly shall perform such functions with respect to the international trusteeship system as are assigned to it under Chapters XII and XIII, including the approval of the trusteeship agreements for areas not designated as strategic.

Article 17

1. The General Assembly shall consider and approve the budget of the organization.

2. The expenses of the organization shall be borne by the members as apportioned by the General Assembly.

3. The General Assembly shall consider and approve any financial and budgetary arrangements with specialized agencies referred to in Article 57 and shall examine the administrative budgets of such specialized agencies with a view to making recommendations to the agencies concerned.

Voting

Article 18

1. Each member of the General Assembly shall have one vote.

2. Decisions of the General Assembly on important questions shall be made by a two-thirds majority of the members present and voting. These questions shall include: recommendations with respect to the maintenance of international peace and security, the election of the non-permanent members of the Security Council, the election of members of the Trusteeship Council in accordance with paragraph 1 (C) of Article 86, the admission of new members to the United Nations, the suspension of the rights and privileges of membership, the expulsion of members, questions relating to the operation of the trusteeship system, and budgetary questions.

3. Decisions on other questions, including the determination of additional categories of questions to be decided by a two-thirds majority, shall be made by a majority of the members present and voting.

Article 19

A member of the United Nations which is in arrears in the payment of its financial contributions to the organization shall have no vote in the General Assembly if the amount of its arrears equals or exceeds the amount of the contributions due from it for the preceding two full years. The General Assembly may, nevertheless, permit such a member to vote if it is satisfied that the failure to pay is due to conditions beyond the control of the member.

Procedure

Article 20

The General Assembly shall meet in regular annual sessions and in such special sessions as occasion may require. Special sessions shall be convoked by the Secretary-General at the request of the Security Council or of a majority of the members of the United Nations.

Article 21

The General Assembly shall adopt its own rules of procedure. It shall elect its President for each session.

Article 22

The General Assembly may establish such subsidiary organs as it deems necessary for the performance of its functions.

CHAPTER V

The Security Council

Composition

Article 23

1. The Security Council shall consist of eleven members of the United Nations. The Republic of China, France, the Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America shall be permanent members of the Security Council. The General Assembly shall elect six other members of the United Nations to be non-permanent members of the Security Council, due regard being specially paid, in the first instance to the contribution of members of the United Nations to the maintenance of international peace and security and to the other purposes of the organization, and also to equitable geographical distribution.

2. The non-permanent members of the Security Council shall be elected for a term of two years. In the first election of the non-permanent members, however, three shall be chosen for a term of one year. A retiring member shall not be eligible for immediate re-election.

3. Each member of the Security Council shall have one representative.

Functions and Powers

Article 24

1. In order to ensure prompt and effective action by the United Nations, its members confer on the Security Council primary responsibility for the maintenance of international peace and security, and agree that in carrying out its duties under this responsibility the Security Council acts on their behalf.

2. In discharging these duties the Security Council shall act in accordance with the purposes and principles of the United Nations. The specific powers granted to the Security Council for the discharge of these duties are laid down in Chapters VI, VII, VIII, and XII.

3. The Security Council shall submit annual and, when necessary, special reports to the General Assembly for its consideration.

Article 25

The members of the United Nations agree to accept and carry out the decisions of the Security Council in accordance with the present charter.

Article 26

In order to promote the establishment and maintenance of international peace and security with the least diversion for armaments of the world's human and economic resources, the Security Council shall be responsible for formulating, with the assistance of the Military Staff Committee referred to in Article 47, plans to be submitted to the members of the United Nations for the establishment of a system for the regulation of armaments.

Voting

Article 27

1. Each member of the Security Council shall have one vote.

2. Decisions of the Security Council on procedural matters shall be made by an affirmative vote of seven members.

3. Decisions of the Security Council on all other matters shall be made by an affirmative vote of seven members including the concurring votes of the permanent members; provided that, in decisions under Chapter VI, and under paragraph 3 of Article 52, a party to a dispute shall abstain from voting.

Procedure

Article 28

1. The Security Council shall be so organized as to be able to function continuously. Each member of the Security Council shall for this purpose be represented at all times at the seat of the organization.

2. The Security Council shall hold periodic meetings at which each of its members may, if it so desires, be rep-

resented by a member of the government or by some other specially designated representative.

3. The Security Council may hold meetings at such places other than the seat of the organization as in its judgment will best facilitate its work.

Article 29

The Security Council may establish such subsidiary organs as it deems necessary for the performance of its functions.

Article 30

The Security Council shall adopt its own rules of procedure, including the method of selecting its President.

Article 31

Any member of the United Nations which is not a member of the Security Council may participate, without vote, in the discussion of any question brought before the Security Council whenever the latter considers that the interests of that member are specially affected.

Article 32

Any member of the United Nations which is not a member of the Security Council or any state which is not a member of the United Nations, if it is a party to a dispute under consideration by the Security Council, shall be invited to participate, without vote, in the discussion relating to the dispute. The Security Council shall lay down such conditions as it deems just for the participation of a state which is not a member of the United Nations.

CHAPTER VI

Pacific Settlement of Disputes

Article 33

1. The parties to any dispute, the continuance of which is likely to endanger the maintenance of international peace and security, shall, first of all, seek a solution by negotiation, enquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies or arrangements, or other peaceful means of their own choice.

2. The Security Council shall, when it deems necessary, call upon the parties to settle their dispute by such means.

Article 34

The Security Council may investigate any dispute, or any situation which might lead to international friction or give rise to a dispute in order to determine whether the continuance of the dispute or situation is likely to endanger the maintenance of international peace and security.

Article 35

1. Any member of the United Nations may bring any dispute or any situation of the nature referred to in Article 34 to the attention of the Security Council or of the General Assembly.

2. A state which is not a member of the United Nations may bring to the attention of the Security Council or of the General Assembly any dispute to which it is a party if it accepts in advance, for the purposes of the dispute, the obligations of pacific settlement provided in the present charter.

3. The proceedings of the General Assembly in respect of matters brought to its attention under this article will be subject to the provisions of Articles 11 and 12.

Article 36

1. The Security Council may, at any stage of a dispute of the nature referred to in Article 33 or of a situation of like nature, recommend appropriate procedures or methods of adjustment.

2. The Security Council should take into consideration any procedures for the settlement of the dispute which have already been adopted by the parties.

3. In making recommendations under this article the Security Council should also take into consideration that legal disputes should as a general rule be referred by the parties to

the International Court of Justice in accordance with the provisions of the Statute of the Court.

Article 37

1. Should the parties to a dispute of the nature referred to in Article 33 fail to settle it by the means indicated in that article, they shall refer it to the Security Council.

2. If the Security Council deems that the continuance of the dispute is in fact likely to endanger the maintenance of international peace and security, it shall decide whether to take action under Article 36 or to recommend such terms of settlement as it may consider appropriate.

Article 38

Without prejudice to the provisions of Article 33-37 the Security Council may, if all the parties to any dispute so request, make recommendations to the parties with a view to a pacific settlement of the dispute.

CHAPTER VII

Action with Respect to Threats to the Peace, Breaches of the Peace, and Acts of Aggression

Article 39

The Security Council shall determine the existence of any threat to the peace, breach of the peace, or act of aggression and shall make recommendations, or decide what measures shall be taken in accordance with Articles 41 and 42, to maintain or restore international peace and security.

Article 40

In order to prevent an aggravation of the situation, the Security Council may, before making the recommendations or deciding upon the measures provided for in Article 39, call upon the parties concerned to comply with such provisional measures as it deems necessary or desirable. Such provisional measures shall be without prejudice to the rights, claims, or position of the parties concerned. The Security Council shall duly take account of failure to comply with such provisional measures.

Article 41

The Security Council may decide what measures not involving the use of armed force are to be employed to give effect to its decisions, and it may call upon the members of the United Nations to apply such measures. These may include complete or partial interruption of economic relations and of rail, sea, air, postal, telegraphic, radio, and other means of communications, and the severance of diplomatic relations.

Article 42

Should the Security Council consider that measures provided for in Article 41 would be inadequate or have proved to be inadequate, it may take such action by air, sea, or land forces as may be necessary to maintain or restore international peace and security. Such action may include demonstrations, blockade, and other operations by air, sea, or land forces of members of the United Nations.

Article 43

1. All members of the United Nations, in order to contribute to the maintenance of international peace and security, undertake to make available to the Security Council, on its call and in accordance with a special agreement or agreements, armed forces, assistance, and facilities, including rights of passage, necessary for the purpose of maintaining international peace and security.

2. Such agreement or agreements shall govern the numbers and types of forces, their degree of readiness and general location, and the nature of the facilities and assistance to be provided.

3. The agreement or agreements shall be negotiated as soon as possible on the initiative of the Security Council. They shall be concluded between the Security Council and members or between the Security Council and groups of members and shall be subject to ratification by the signa-

tory states in accordance with their respective constitutional processes.

Article 44

When the Security Council has decided to use force it shall, before calling upon a member not represented on it to provide armed forces in fulfilment of the obligations assumed under Article 43, invite that member, if the member so desires, to participate in the decisions of the Security Council concerning the employment of contingents of that member's armed forces.

Article 45

In order to enable the United Nations to take urgent military measures, members shall hold immediately available national air-force contingents for combined international enforcement action. The strength and degree of readiness of these contingents and plans for their combined action shall be determined, within the limits laid down in the special agreement or agreements referred to in Article 43, by the Security Council with the assistance of the Military Staff Committee.

Article 46

Plans for the application of armed force shall be made by the Security Council with the assistance of the Military Staff Committee.

Article 47

1. There shall be established a Military Staff Committee to advise and assist the Security Council on all questions relating to the Security Council's military requirements for the maintenance of international peace and security, the employment and command of forces placed at its disposal, the regulation of armaments, and possible disarmament.

2. The Military Staff Committee shall consist of the Chiefs of Staff of the permanent members of the Security Council or their representatives. Any member of the United Nations not permanently represented on the Committee shall be invited by the Committee to be associated with it when the efficient discharge of the Committee's responsibilities requires the participation of that member in its work.

3. The Military Staff Committee shall be responsible under the Security Council for the strategic direction of any armed forces placed at the disposal of the Security Council. Questions relating to the command of such forces shall be worked out subsequently.

4. The Military Staff Committee, with the authorization of the Security Council and after consultation with appropriate regional agencies, may establish regional subcommittees.

Article 48

1. The action required to carry out the decisions of the Security Council for the maintenance of international peace and security shall be taken by all the members of the United Nations or by some of them, as the Security Council may determine.

2. Such decisions shall be carried out by the members of the United Nations directly and through their action in the appropriate international agencies of which they are members.

Article 49

The members of the United Nations shall join in affording mutual assistance in carrying out the measures decided upon by the Security Council.

Article 50

If preventive or enforcement measures against any state are taken by the Security Council, any other state, whether a member of the United Nations or not, which finds itself confronted with special economic problems arising from the carrying out of those measures shall have the right to consult the Security Council with regard to a solution of those problems.

Article 51

Nothing in the present charter shall impair the inherent right of individual or collective self-defense if an armed attack occurs against a member of the United Nations, until the Security Council has taken the measures necessary to maintain international peace and security. Measures taken by members in the exercise of this right of self-defense shall be immediately reported to the Security Council and shall not in any way affect the authority and responsibility of the Security Council under the present charter to take at any time such action as it deems necessary in order to maintain or restore international peace and security.

CHAPTER VIII

Regional Arrangements

Article 52

1. Nothing in the present charter precludes the existence of regional arrangements or agencies for dealing with such matters relating to the maintenance of international peace and security as are appropriate for regional action, provided that such arrangements or agencies and their activities are consistent with the purposes and principles of the United Nations.

2. The members of the United Nations entering into such arrangements or constituting such agencies shall make every effort to achieve pacific settlement of local disputes through such regional arrangements or by such regional agencies before referring them to the Security Council.

3. The Security Council shall encourage the development of pacific settlement of local disputes through such regional arrangements or by such regional agencies either on the initiative of the states concerned or by reference from the Security Council.

4. This article in no way impairs the application of Articles 34 and 35.

Article 53

1. The Security Council shall, where appropriate, utilize such regional arrangements or agencies for enforcement action under its authority. But no enforcement action shall be taken under regional arrangements or by regional agencies without the authorization of the Security Council, with the exception of measures against any enemy state, as defined in paragraph 2 of this article, provided for pursuant to Article 107 or in regional arrangements directed against renewal of aggressive policy on the part of any such state, until such time as the organization may, on request of the governments concerned, be charged with the responsibility for preventing further aggression by such a state.

2. The term enemy state as used in paragraph 1 of this article applies to any state which during the Second World War has been an enemy of any signatory of the present charter.

Article 54

The Security Council shall at all times be kept fully informed of activities undertaken or in contemplation under regional arrangements or by regional agencies for the maintenance of international peace and security.

CHAPTER IX

International Economic and Social Cooperation

Article 55

With a view to the creation of conditions of stability and well-being which are necessary for peaceful and friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples, the United Nations shall promote:

A. Higher standards of living, full employment, and conditions of economic and social progress and development;

B. Solutions of international economic, social, health, and related problems; and international cultural and educational cooperation; and

C. Universal respect for, and observance of, human rights and fundamental freedoms for all without distinction as to race, sex, language or religion.

Article 56

All members pledge themselves to take joint and separate action in cooperation with the organization for the achievement of the purposes set forth in Article 55.

Article 57

1. The various specialized agencies, established by intergovernmental agreement and having wide international responsibilities, as defined in their basic instruments, in economic, social, cultural, educational, health, and related fields, shall be brought into relationship with the United Nations in accordance with the provisions of Article 63.

2. Such agencies thus brought into relationship with the United Nations are hereinafter referred to as specialized agencies.

Article 58

The organization shall make recommendations for the coordination of the policies and activities of the specialized agencies.

Article 59

The organization shall, where appropriate, initiate negotiations among the states concerned for the creation of any new specialized agencies required for the accomplishment of the purposes set forth in Article 55.

Article 60

Responsibility for the discharge of the functions of the organization set forth in this chapter shall be vested in the General Assembly and, under the authority of the General Assembly, in the Economic and Social Council, which shall have for this purpose the powers set forth in Chapter X.

CHAPTER X

The Economic and Social Council

Composition

Article 61

1. The Economic and Social Council shall consist of eighteen members of the United Nations elected by the General Assembly.

2. Subject to the provisions of paragraph 3, six members of the Economic and Social Council shall be elected each year for a term of three years. A retiring member shall be eligible for immediate re-election.

3. At the first election, eighteen members of the Economic and Social Council shall be chosen. The term of office of six members so chosen shall expire at the end of one year, and of six other members at the end of two years, in accordance with arrangements made by the General Assembly.

4. Each member of the Economic and Social Council shall have one representative.

Functions and Powers

Article 62

1. The Economic and Social Council may make or initiate studies and reports with respect to international economic, social, cultural, educational, health, and related matters and may make recommendations with respect to any such matters to the General Assembly, to the members of the United Nations, and to the specialized agencies concerned.

2. It may make recommendations for the purpose of promoting respect for, and observance of, human rights and fundamental freedoms for all.

3. It may prepare draft conventions for submission to the General Assembly, with respect to matters falling within its competence.

4. It may call, in accordance with the rules prescribed by the United Nations, international conferences on matters falling within its competence.

Article 63

1. The Economic and Social Council may enter into agreements with any of the agencies referred to in Article 57, defining the terms on which the agency concerned shall be brought into relationship with the United Nations. Such agreements shall be subject to approval by the General Assembly.

2. It may coordinate the activities of the specialized agencies through consultation with and recommendations to such agencies and through recommendations to the General Assembly and to the members of the United Nations.

Article 64

1. The Economic and Social Council may take appropriate steps to obtain regular reports from the special-

ized agencies. It may make arrangements with the members of the United Nations and with the specialized agencies to obtain reports on the steps taken to give effect to its own recommendations and to recommendations on matters falling within its competence made by the General Assembly.

2. It may communicate its observations on these reports to the General Assembly.

Article 65

The Economic and Social Council may furnish information to the Security Council and shall assist the Security Council upon its request.

Article 66

1. The Economic and Social Council shall perform such functions as fall within its competence in connection with the carrying out of the recommendations of the General Assembly.

2. It may, with the approval of the General Assembly, perform services at the request of members of the United Nations and at the request of specialized agencies.

3. It shall perform such other functions as are specified elsewhere in the present charter or as may be assigned to it by the General Assembly.

Voting

Article 67

1. Each member of the Economic and Social Council shall have one vote.

2. Decisions of the Economic and Social Council shall be made by a majority of the members present and voting.

Procedure

Article 68

The Economic and Social Council shall set up commissions in economic and social fields and for the promotion of human rights, and such other commissions as may be required for the performance of its functions.

Article 69

The Economic and Social Council shall invite any member of the United Nations to participate, without vote, in its deliberations on any matter of particular concern to that member.

Article 70

The Economic and Social Council may make arrangements for representatives of the specialized agencies to participate, without vote, in its deliberations and in those of the commissions established by it, and for its representatives to participate in deliberations of the specialized agencies.

Article 71

The Economic and Social Council may make suitable arrangements for consultation with non-governmental organizations which are concerned with matters within its competence. Such arrangements may be made with international organizations and, where appropriate, with national organizations after consultation with the member of the United Nations concerned.

Article 72

1. The Economic and Social Council shall adopt its own rules of procedure, including the method of selecting its President.

2. The Economic and Social Council shall meet as required in accordance with its rules, which shall include provision for the convening of meetings on the request of a majority of its members.

CHAPTER XI

DECLARATION REGARDING NON-SELF-GOVERNING TERRITORIES

Article 73

Members of the United Nations, which have or assume responsibilities for the administration of territories whose peoples have not yet attained a full measure of self-government recognize the principle that the interests of the inhabitants of these territories are paramount, and accept as a sacred trust the obligation to promote to the utmost, within the system of international peace and security established by the present charter, the well-being of the inhabitants of these territories, and, to this end:

A. To ensure, with due respect for the culture of the peoples concerned, their political, economic, social, and educational advancement, their just treatment, and their protection against abuses;

B. To develop self-government, to take due account of the political aspirations of the peoples, and to assist them in the progressive development of their free political institutions, according to the particular circumstances of each territory and its peoples and their varying stages of advancement;

C. To further international peace and security;

D. To promote constructive measures of development, to encourage research, and to cooperate with one another and, when and where appropriate, with specialized international bodies with a view to the practical achievement of the social, economic, and scientific purposes set forth in this article; and

E. To transmit regularly to the Secretary-General for information purposes, subject to such limitation as security and constitutional considerations may require, statistical and other information of a technical nature relating to economic, social, and educational conditions in the territories for which they are respectively responsible other than those territories to which Chapters XII and XIII apply.

Article 74

Members of the United Nations also agree that their policy in respect of the territories to which this chapter applies, no less than in respect of their metropolitan areas must be based on the general principle of good-neighborliness, due account being taken of the interests and well-being of the rest of the world, in social, economic, and commercial matters.

CHAPTER XII

INTERNATIONAL TRUSTEESHIP SYSTEM

Article 75

The United Nations shall establish under its authority an international trusteeship system for the administration and supervision of such territories as may be placed thereunder by subsequent individual agreements. These territories are hereinafter referred to as trust territories.

Article 76

The basic objectives of the trusteeship system, in accordance with the purposes of the United Nations laid down in Article 1 of the present charter, shall be:

A. To further international peace and security;

B. To promote the political, economic, social and educational advancement of the inhabitants of the trust territories, and their progressive development towards self-government or independence as may be appropriate to the particular circumstances of each territory and its peoples and the freely expressed wishes of the peoples concerned, and as may be provided by the terms of each trusteeship agreement:

C. To encourage respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion, and to encourage recognition of the interdependence of the peoples of the world; and

D. To ensure equal treatment in social, economic, and commercial matters for all members of the United Nations and their nationals, and also equal treatment for the latter in the administration of justice, without prejudice to the attainment of the foregoing objectives and subject to the provisions of Article 80.

Article 77

1. The trusteeship system shall apply to such territories in the following categories as may be placed thereunder by means of trusteeship agreements:

A. Territories now held under mandate;

B. Territories which may be detached from enemy states as a result of the Second World War; and

C. Territories voluntarily placed

under the system by states responsible for their administration.

2. It will be a matter for subsequent agreement as to which territories in the foregoing categories will be brought under the trusteeship system and upon what terms.

Article 78

The trusteeship system shall not apply to territories which have become members of the United Nations, relationship among which shall be based on respect for the principle of sovereign equality.

Article 79

The terms of trusteeship for each territory to be placed under the trusteeship system, including any alteration or amendment, shall be agreed upon by the states directly concerned, including the mandatory power in the case of territories held under mandate by a member of the United Nations, and shall be approved as provided for in Articles 83 and 85.

Article 80

1. Except as may be agreed upon in individual trusteeship agreements, made under Articles 77, 79, and 81, placing each territory under the trusteeship system, and until such agreements have been concluded, nothing in this chapter shall be construed in or of itself to alter in any manner the rights whatsoever of any states or any peoples or the terms of existing international instruments to which members of the United Nations may respectively be parties.

2. Paragraph 1 of this article shall not be interpreted as giving grounds for delay or postponement of the negotiation and conclusion of agreements for placing mandated and other territories under the trusteeship system as provided for in Article 77.

Article 81

The trusteeship agreement shall in each case include the terms under which the trust territory will be administered and designate the authority which will exercise the administration of the trust territory. Such authority, hereinafter called the administering authority, may be one or more states or the organization itself.

Article 82

There may be designated, in any trusteeship agreement, a strategic area or areas which may include part or all of the trust territory to which the agreement applies, without prejudice to any special agreement or agreements made under Article 43.

Article 83

1. All functions of the United Nations relating to strategic areas including the approval of the terms of the trusteeship agreements and of their alteration or amendment shall be exercised by the Security Council.

2. The basic objectives set forth in Article 76 shall be applicable to the people of each strategic area.

3. The Security Council shall, subject to the provisions of the trusteeship agreements and without prejudice to security considerations, avail itself of the assistance of the Trusteeship Council to perform those functions of the United Nations under the trusteeship system relating to political, economic, social, and educational matters in the strategic areas.

Article 84

It shall be the duty of the administering authority to ensure that the trust territory shall play its part in the maintenance of international peace and security. To this end the administering authority may make use of volunteer forces, facilities, and assistance from the trust territory in carrying out the obligations towards the Security Council undertaken in this regard by the administering authority, as well as for local defense and the maintenance of law and order within the trust territory.

Article 85

1. The functions of the United Nations with regard to trusteeship agreements for all areas not designated as strategic, including the approval of the terms of the trusteeship agreements and of their alteration or amendment, shall be exercised by the General Assembly.

2. The Trusteeship Council, operating under the authority of the General Assembly, shall assist the General Assembly in carrying out these functions.

CHAPTER XIII

The Trusteeship Council

Composition

Article 86

1. The Trusteeship Council shall consist of the following members of the United Nations:

A. Those members administering trust territories;

B. Such of those members mentioned by name in Article 23 as are not administering trust territories; and

C. As many other members elected for three-year terms by the General Assembly as may be necessary to ensure that the total number of members of the Trusteeship Council is equally divided between those members of the United Nations which administer trust territories and those which do not.

2. Each member of the Trusteeship Council shall designate one specially qualified person to represent it therein.

Functions and Powers

Article 87

The General Assembly and, under its authority, the Trusteeship Council, in carrying out their functions, may:

A. Consider reports submitted by the administering authority;

B. Accept petitions and examine them in consultation with the administering authority;

C. Provide for periodic visits to the respective trust territories at times agreed upon with the administering authority; and

D. Take these and other actions in conformity with the terms of the trusteeship agreements.

Article 88

The Trusteeship Council shall formulate a questionnaire on the political, economic, social and educational advancement of the inhabitants of each trust territory, and the administering authority for each trust territory within the competence of the General Assembly shall make an annual report to the General Assembly upon the basis of such questionnaire.

Voting

Article 89

1. Each member of the Trusteeship Council shall have one vote.

2. Decisions of the Trusteeship Council shall be made by a majority of the members present and voting.

Procedure

Article 90

1. The Trusteeship Council shall adopt its own rules of procedure, including the method of selecting its President.

2. The Trusteeship Council shall meet as required in accordance with its rules, which shall include provision for the convening of meetings on the request of a majority of its members.

Article 91

The Trusteeship Council shall, when appropriate, avail itself of the assistance of the Economic and Social Council and of the specialized agencies in regard to matters with which they are respectively concerned.

CHAPTER XIV

The International Court of Justice

Article 92

The International Court of Justice shall be the principal judicial organ of the United Nations. It shall function in accordance with the annexed Statute, which is based upon the Statute of the Permanent Court of International Justice and forms an integral part of the present charter.

Article 93

1. All members of the United Nations are ipso facto parties to the

Statute of the International Court of Justice.

2. A state which is not a member of the United Nations may become a party to the Statute of the International Court of Justice on conditions to be determined in each case by the General Assembly upon the recommendation of the Security Council.

Article 94

1. Each member of the United Nations undertakes to comply with the decision of the International Court of Justice in any case to which it is a party.

2. If any party to a case fails to perform the obligations incumbent upon it under a judgment rendered by the Court, the other party may have recourse to the Security Council, which may, if it deems necessary, make recommendations or decide upon measures to be taken to give effect to the judgment.

Article 95

Nothing in the present charter shall prevent members of the United Nations from entrusting the solution of their differences to other tribunals by virtue of agreements already in existence or which may be concluded in the future.

Article 96

1. The General Assembly or the Security Council may request the International Court of Justice to give an advisory opinion on any legal question.

2. Other organs of the United Nations and specialized agencies, which may at any time be so authorized by the General Assembly, may also request advisory opinions of the Court on legal questions arising within the scope of their activities.

CHAPTER XV

THE SECRETARIAT

Article 97

The Secretariat shall comprise a Secretary-General and such staff as the organization may require. The Secretary-General shall be appointed by the General Assembly upon the recommendation of the Security Council. He shall be the chief administrative officer of the organization.

Article 98

The Secretary-General shall act in that capacity in all meetings of the General Assembly, of the Security Council, of the Economic and Social Council, and of the Trusteeship Council, and shall perform such other functions as are entrusted to him by these organs. The Secretary-General shall make an annual report to the General Assembly on the work of the organization.

Article 99

The Secretary-General may bring to the attention of the Security Council any matter which in his opinion may threaten the maintenance of international peace and security.

Article 100

1. In the performance of their duties the Secretary-General and the staff shall not seek or receive instructions from any government or from any other authority external to the organization. They shall refrain from any action which might reflect on their position as international officials responsible only to the organization.

2. Each member of the United Nations undertakes to respect the exclusively international character of the responsibilities of the Secretary-General and the staff and not to seek to influence them in the discharge of their responsibilities.

Article 101

1. The staff shall be appointed by the Secretary-General under regulations established by the General Assembly.

2. Appropriate staffs shall be permanently assigned to the Economic and Social Council, the Trusteeship Council, and, as required, to other organs of the United Nations. These

staffs shall form a part of the Secretariat.

3. The paramount consideration in the employment of the staff and in the determination of the conditions of service shall be the necessity of securing the highest standards of efficiency, competence, and integrity. Due regard shall be paid to the importance of recruiting the staff on as wide a geographical basis as possible.

CHAPTER XVI

Miscellaneous Provisions

Article 102

1. Every treaty and every international agreement entered into by any member of the United Nations after the present charter comes into force shall as soon as possible be registered with the Secretariat and published by it.

2. No party to any such treaty or international agreement which has not been registered in accordance with the provisions of paragraph 1 of this article may invoke that treaty or agreement before any organ of the United Nations.

Article 103

In the event of a conflict between the obligations of the members of the United Nations under the present charter and their obligations under any other international agreement, their obligations under the present charter shall prevail.

Article 104

The organization shall enjoy in the territory of each of its members such legal capacity as may be necessary for the exercise of its functions and the fulfillment of its purposes.

Article 105

1. The organization shall enjoy in the territory of each of its members such privileges and immunities as are necessary for the fulfillment of its purposes.

2. Representatives of the members of the United Nations and officials of the organization shall similarly enjoy such privileges and immunities as are necessary for the independent exercise of their functions in connection with the organization.

3. The General Assembly may make recommendations with a view to determining the details of the application of paragraphs 1 and 2 of this article or may propose conventions to the members of the United Nations for this purpose.

CHAPTER XVII

Transitional Security Arrangements

Article 106

Pending the coming into force of such special agreements referred to in Article 43 as in the opinion of the Security Council enable it to begin the exercise of its responsibilities under Article 42, the parties to the Four-Nation Declaration, signed at Moscow, October 30, 1943, and France, shall, in accordance with the provisions of paragraph 5 of that declaration, consult with one another and as occasion requires with other members of the United Nations with a view to such joint action on behalf of the organization as may be necessary for the purpose of maintaining international peace and security.

Article 107

Nothing in the present charter shall invalidate or preclude action, in relation to any state which during the Second World War has been an enemy of any signatory to the present charter, taken or authorized as a result of that war by the governments having responsibility for such action.

CHAPTER XVIII

Amendments

Article 108

Amendments to the present charter shall come into force for all members of the United Nations when they have been adopted by a vote of two-thirds of the members of the General Assembly and ratified in accordance with their respective constitutional processes by two-thirds of the members of the United Nations, including all the permanent members of the Security Council.

Article 109

1. A general conference of the members of the United Nations for the purpose of reviewing the present charter may be held at a date and place to be fixed by a two-thirds vote of the members of the General Assembly and by a vote of any seven members of the Security Council. Each member of the United Nations shall have one vote in the conference.

2. Any alteration of the present charter recommended by a two-thirds vote of the conference shall take effect when ratified in accordance with their respective constitutional processes by two-thirds of the members of the United Nations including all the permanent members of the Security Council.

3. If such a conference has not been held before the tenth annual session of the General Assembly following the coming into force of the present charter, the proposal to call such a conference shall be placed on the agenda of that session of the General Assembly, and the conference shall be held if so decided by a majority vote of the members of the General Assembly and by a vote of any seven members of the Security Council.

CHAPTER XIX

Ratification and Signature

Article 110

1. The present charter shall be ratified by the signatory states in accordance with their respective constitutional processes.

2. The ratifications shall be deposited with the Government of the United States of America, which shall notify all the signatory states of each deposit as well as the Secretary-General of the organization when he has been appointed.

3. The present charter shall come into force upon the deposit of ratifications by the Republic of China, France, the Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America, and by a majority of the other signatory states. A protocol of the ratifications deposited shall thereupon be drawn up by the Government of the United States of America which shall communicate copies thereof to all the signatory states.

4. The states signatory to the present charter which ratify it after it has come into force will become original members of the United Nations on the date of the deposit of their respective ratifications.

Article 111

The present charter, of which the Chinese, French, Russian, English and Spanish texts are equally authentic, shall remain deposited in the archives of the Government of the United States of America. Duly certified copies thereof shall be transmitted by that government to the governments of the other signatory states.

IN FAITH WHEREOF the representatives of the governments of the United Nations have signed the present charter.

Done at the city of San Francisco the twenty-sixth day of June, one thousand nine hundred and forty-five.

THE WAR IN EUROPE: LAST PHASE

By Winifred Nelson Hadsel
Research Associate, Foreign Policy Association

THE WESTERN FRONT

At the close of 1944 the German armies in the West made a final desperate effort to stave off disaster by launching a counterattack, the immediate aim of which was to capture Liège (key American supply center), cross the Meuse, and divide the British from the Americans by taking Antwerp. Combined Anglo-American might stopped the Germans, however, and the "battle of the bulge" was nearly over by the end of January, 1945. As a result of this attempt the Germans succeeded in delaying the main Allied offensive in the North nearly six weeks. The cost of this effort was so great, however, that the Reich was stripped of all strategic reserves and resources required to meet the powerful Soviet offensive in the East.

Once the German counterattack had been halted by the American First and Third Armies, the British Second Army took the offensive in the Sitard area in mid-January, and within a fortnight reached the Roer Valley, ten miles inside Germany. Meanwhile, in the South, the French First Army and the U. S. XXI Corps attacked in the Colmar area, and by Feb. 9 held a loosely defended line along the west bank of the Rhine from Strasbourg to the Swiss border.

THE CROSSING OF THE RHINE

Before the Germans could be cleared from the entire west bank of the Rhine, it was necessary for the Allies to seize the Roer River dams to the north in the vicinity of Schmidt. By Feb. 11, the U. S. First Army gained control of the Urft and Schwammanauel dams and cleared the entire west bank of the Roer. This action failed to prevent flooding of the Roer Valley, but it did force the Germans to release the waters at a moment when Allied operations would not be seriously affected. In this way, one of the serious threats to General Eisenhower's plans for the invasion of northern Germany was removed.

The objectives of the next phase of the Allied campaign in the West were the closing of the Rhine, the destruction of enemy forces west of the river, and the seizure of bridgeheads across the river. In executing plans for these operations, the First Canadian Army, at the northern end of the western front, began a drive southeastward from the Nijmegen bridgehead along the watershed between the Meuse and Rhine rivers on Feb. 8, while the American Ninth Army attacked across the Roer toward Duesseldorf on Feb. 23. Flooded terrain hindered the Canadians, but by March 2 their armored columns reached the Rhine north and south of Duesseldorf. Meanwhile, in the middle of the Allied line, the U. S. Third Army crossed the Saar river and took Trier on March 2.

Advancing on the right of the Ninth Army, the U. S. First Army captured the ruins of Cologne on March 7, and on the same day elements of the 9th Armored Division, probing the Rhine farther south, found the Ludendorff Bridge at Remagen intact. Crossing immediately to the east bank, these American units developed a small bridgehead. This brilliant seizure of the Remagen bridge was one of the most dramatic incidents on the western front, and, according to General Marshall, showed "American initiative and adaptability at its best." The Remagen bridgehead was immediately exploited, in accordance with direct orders from General Eisenhower, and proved a useful springboard for the final Allied plunge into Germany.

In the meantime, the U. S. Third Army forced its way through the Eifel hills, and General Patton's armor broke out toward the Rhine near Coblenz, where contact was established with U. S. First Army units southeast of Remagen. By March 11, the Allies controlled the west bank of the Rhine from Nijmegen in Holland to Coblenz. Thereupon the U. S. Third and Seventh Armies turned to reducing the Saar pocket, an operation which involved breaking through strongly fortified areas of the Siegfried Line.

OFFENSIVE BEYOND THE RHINE

By the end of March, the Rhine had been crossed at a number of points, and the freedom of action of the Germans on the east bank was greatly curtailed. General Eisenhower began to prepare his offensive beyond the Rhine, selecting for the main effort the area north of the Ruhr. This area was chosen in order to deny to Germany the remaining Ruhr industries and to take advantage of the gently rolling terrain, which was highly suitable for the type of mobile and tank operations it was desired to force upon the Wehrmacht because of its shortages of tanks, vehicles, and fuel.

The Second British Army began an assault crossing of the Rhine on March 23 between Emmerich and Wesel and was aided shortly thereafter by the U. S. 17th and British 6th Airborne Divisions, and the U. S. Ninth Army. Within two days the British and Americans had built seven bridges across the river and had a bridgehead 25 miles along the Rhine.

To the surprise of the Germans, who had expected the U. S. First Army to strike northward, General Hodges broke out of the Remagen bridgehead to the southeast and raced along the superhighway toward Frankfort at the end of March. First Army armored columns speeded eastward as fast as 40 miles a day, reaching Marburg by March 28, and then swung northward through the hill country west of Kassel. Third Army troops, meanwhile, crossed the Rhine at Mainz, driving toward Kassel.

Once the U. S. First and Third Armies were in solid contact, these forces had the complete rout of the German military establishment under way. In the rear of these Armies, the U. S. Ninth Army pressed into the northwestern section of the Ruhr, the U. S. Seventh Army crossed the Rhine in the south near Mannheim, and the First French Army also crossed the river and established contact with the U. S. Seventh Army near Heidelberg.

THRUST INTO CENTRAL GERMANY AND AUSTRIA—JUNCTURE WITH RED ARMY

The strength of the Allied offensive, coupled with the shattered condition of the German transport system, prevented the enemy from establishing a defensive line in any sector. Armored columns of the U. S. First and Ninth Armies continued to speed into Germany, headed for Leipzig and a prearranged junction with the Red Army. By mid-April, American troops were along the Elbe near Wittenberg and Magdeburg and had established bridgeheads across the river. Bypassing Leipzig, the First Army drove eastward to the Mulde Valley south of Dessau. To establish contact with the Red Army, First Army patrols pushed east of the Mulde to Torgau, where the juncture with the Russians occurred April 25.

While these extensive operations were occurring in central Germany, the battle progressed against the trapped Germans in the Ruhr. To the South, the Third Army turned southeast toward Czechoslovakia and the Danube Valley in order to establish firm contact with the Red Army in Austria and to prevent effective German regrouping in the "mountain redoubt" in southern Germany. On May 1, the Third Army advanced into Czechoslovakia and, by May 5, entered Linz, while the Seventh Army, which had taken Munich, was moving southward toward the Inn River, and the French were moving into western Austria.

THE GERMAN SURRENDER

On May 6 the German Army Group "G," comprising all German forces in Austria, surrendered unconditionally.

On May 7, surrounded on all fronts by overwhelming defeat, emissaries of the German Government surrendered unconditionally all their land, sea, and air forces to the Allies at Reims. The following day, representatives of the German High Command signed another act of military surrender to the Allies in Berlin, on territory occupied by the Russians.

ALLIED REJECTION OF HITLER SUCCESSORS

In accepting the unconditional surrender of the German armies, the Allies refused to recognize the existence of any German régime. Gestapo Chief Heinrich Himmler, who attempted to open peace negotiations with Britain and the United States in what was apparently a final Nazi effort to divide the Western Allies and Russia, was promptly spurned. Although Grand Admiral Karl Doenitz was used by Anglo-American military authorities May 2-May 16 to issue surrender orders to scattered units of the U-boat fleet and to expedite disarmament of the Wehrmacht, his argument that the victors would need the aid of the German High Command in controlling Germany was ignored. On May 16 the Allies arrested the members of his régime and undertook the occupation of the Reich without the aid of any German authority.

THE EASTERN FRONT

The Russian winter offensive began to roll across the Polish plains on Jan. 12, 1945, thus breaking the lull on this principal eastern front. From East Prussia to the Carpathians, five Russian armies drove rapidly across territory that had been held by the Germans since September 1939. The basic Russian strategy resembled the pattern used by Napoleon at Austerlitz 140 years before—"penetration of the center in order to develop the wings." The main attack was accordingly directed straight across Poland, while the armies on the right and left kept wheeling to push out the flanks.

In the southern sector of the Russian line, the springboard was the Sandimierz salient across the southern Vistula, which the Russians had won in the preceding summer offensive. In mid-January, Marshal Koneff broke through in this area and overran nearly all of German-occupied southern Poland. The Red Army then took the railroad hub of Kulce, sped on to capture the manufacturing and communications center of Czestchowa, and engulfed Cracow. One of the main objectives of these forces was to drive into Silesia, important for its coal and iron mines, armaments factories and synthetic oil plants.

In the northern sector, the Second White Russian Army under Marshal Konstantin Kokossovsky moved from its bridgehead on the Narew River, skirted the Masurian Lakes, and moved toward Danzig. Meanwhile the Third White Russian Army under Marshal Ivan Cherniakovsky struck directly into East Prussia from the Kaunas area.

In the central sector, the Red Army focused its attention on Warsaw, which remained, despite its virtual destruction, the main bastion of Germany's Vistula line. Marshal Gregory Zhukoff, second in command to Marshal Stalin, swept around the city with his First White Russian Army and forced the Nazi garrison to retreat, thus ending a five-month deadlock. The Russians entered the city on Jan. 17, and Soviet-armed Polish troops aided the Red Army in occupying the capital.

Meanwhile the main body of Zhukoff's forces moved westward across the Polish plains to capture Lodz, the key position between the southern and central sectors of the German line. This drive through the center was the crucial one which the offensives in the North and South were designed to support, and one of its chief objectives was the seizure of Berlin and of streams which allowed passage around the fortress cities. For a time it appeared that the Germans might attempt to make a stand on the Oder, but their lack of supplies and manpower prevented them from doing so. Although the Oder did somewhat hinder the movements of the Russians, it did not prevent the Red Army from standing only 32 miles from Berlin at the beginning of February, 1945.

In mid-February, a new phase in the battle for eastern Germany developed. The Russian tide, which had been directed at Berlin, then became a flood which spread out in order to protect Zhukoff's crucial front along the Oder, which was then only the narrow tip of a deep salient. In the North the Russians fanned out into East Prussia and Pomerania, and in the South they overran Silesia. By the end of March, the Russians were again ready to press their offensive toward Berlin. After bitter house-to-house fighting all along the way from the suburbs into the very heart of the city, the Red Army succeeded in raising the Hammer and Sickle over the Reichschancellery on May 2, seven days before Soviet and other Allied representatives received the unconditional surrender of Germany in Berlin.

BATTLE OF VIENNA

Meanwhile, far to the south, the offensive in the Danube valley, begun the preceding autumn, continued, and during March the battle for Vienna developed. Vienna was not only the hub of the whole upper Danube Valley, dominating the approaches to the inner Reich through Bavaria and Czechoslovakia, but during the last stages of the Second World War, the key to the "Alpine Redoubt," where the die-hard Nazis had apparently intended to make a final effort to delay complete Allied victory. At the beginning of April Marshal Feodor Tolbukhin struck into the city's southern industrial suburbs, while other Russian forces under Marshal Rodin Malinovsky pressed the attack from Bratislava in order to cut Vienna off from the North. The Austrian capital was finally taken by the Red Army on April 13.

FINAL PHASES OF THE ITALIAN CAMPAIGN

During the late winter, ground activities on the Italian front were limited to small advances in the mountains southwest of Bologna. In the air, however, Italian-based planes maintained pressure on communications and industrial targets beyond the Alps, reaching as far north as Berlin. General Mark Clark's Fifteenth Army Group, composed of a variety of United Nations elements, launched its spring drive on April 9, succeeding in taking Bologna after a week of heavy fighting and in crossing the Po at a number of points.

The final week of the war in Italy brought wide advances throughout northern Italy, liberating Padua, Venice, and Milan, and destroying German resistance everywhere. On May 2, the slow and bitter Italian campaign was finally concluded when the commander of the German armies in northern Italy capitulated.

ALLIED PLANS FOR OCCUPATION OF GERMANY ANNOUNCED AT YALTA

Prior to the unconditional surrender of Germany, the Allies had drawn up a list of the fundamental objectives they hoped to achieve in the Reich during the period of military occupation. At the Crimea Conference of the Big Three in February 1945, the general Allied goal, as defined in the official communiqué, was "to destroy German militarism and Nazism (thus insuring that) Germany will never again be able to disturb the peace of the world." As far as German territories were concerned, the communiqué hinted that the Reich would be considerably reduced, since the Conference recognized the Curzon Line as the new Polish-Russian frontier and recognized that Poland should be compensated for its territorial losses by receiving "substantial accessions of territory in the North and West." These punitive measures were somewhat offset, however, by the statement: "It is not our purpose to destroy the people of Germany, but only when Nazism and

Militarism have been extirpated will there be hope for a decent life for Germans, and a place for them in the comity of nations."

In order to carry out the Yalta plans for the period of military occupation, the Allies proposed the partition of Germany into four zones, a plan which had apparently been agreed upon at Teheran in December 1943, with the forces of the United States, Russia, Britain, and France each occupying a separate zone. Then, since it was clearly impossible for the Allies to rule Germany without some kind of central control machinery, the Big Three proposed the establishment of an Allied Control Council, consisting of the Supreme Commanders of the four occupying powers, with headquarters in Berlin.

With specific Allied plans for the period of military occupation still incomplete at the moment of Germany's surrender and final arrangements for setting up the proposed Allied Control Council still in doubt, each Allied army in Germany was more or less on its own in coping with the confusion that accompanied the end of hostilities. Under these conditions of decentralized control, the different political and social views of the various Allies naturally tended to express themselves in somewhat divergent policies of military government.

JOINT CHIEFS OF STAFF DIRECTIVE TO EISENHOWER IN AMERICAN ZONE

In the American zone, the policies of the military government authorities were outlined in a Joint Chiefs of Staff directive issued to General Eisenhower in April 1945. Since many of the policy statements contained in the directive were adopted in substance by the other members of the Big Three at the Potsdam Conference in July, this JCS Document was of significance throughout Germany.

In one of the leading statements of the directive, released to the public on Oct. 17, it was stated that "Germany will not be occupied for the purpose of liberation but as a defeated enemy nation. Your aim is not oppression but to occupy Germany for the purpose of realizing certain important Allied objectives. The principal Allied objective is to prevent Germany from ever again becoming a threat to the peace of the world. Essential steps in the accomplishment of this objective are the elimination of Nazism and militarism in all their forms, the immediate apprehension of war criminals for punishment, the industrial disarmament and demilitarization of Germany, with continuing control over Germany's capacity to make war, and the preparation for an eventual reconstruction of German political life on a democratic basis. Other Allied objectives are to enforce the program of reparations and restitution, to provide relief for the benefit of countries devastated by Nazi aggression, and to ensure that prisoners of war and displaced persons of the United Nations are cared for and repatriated."

ALLIED CONTROL COUNCIL IN BERLIN

In an attempt to synchronize the divergent policies that were developing under the zonal system of occupation, the Big Three organized the Allied Control Council in Berlin on June 5, and authorized it to exercise supreme authority over Germany "in matters affecting Germany as a whole." Russia, Britain, and the United States planned in this way to give Germany a central political and economic military administration despite its partition into zones during the period of occupation. A single member of the Council, however, could prevent the administration of Germany as a unit, since decisions by the members had to be reached by unanimous vote.

The French, who were not invited to the Potsdam Conference but were nevertheless members of the Allied Control Council for Germany, considered plans for the unified administration of Germany unacceptable as long as the Rhineland and Ruhr, which France viewed as potential sources of military strength, remained attached to Germany. Accordingly, the French representative on the Allied Control Council consistently vetoed all proposals before the Council for Joint Allied Action on the Political and Economic Problems of Germany as a whole. By the end of 1945, therefore, the promise of unified Allied control of Germany by the Allied Control Council in Berlin had not been realized.

POTSDAM TERRITORIAL TERMS FOR GERMANY

The territorial terms outlined for Germany by the Big Three at the Potsdam Conference reduced the Reich to approximately 80 per cent of its pre-Munich area and gave Russia a common boundary with Germany, while the western Polish frontier was advanced to within 50 miles of Berlin. Although the conference specifically stated that the territorial changes it proposed awaited "final determination of territorial questions at the peace settlement," the mass deportations of Germans from the territories annexed by Russia and Poland, both before and after the Potsdam Conference, indicated that the map of eastern Germany was, in effect, redrawn at Potsdam.

Recognizing the problems created by the deportations of millions of Germans from eastern European areas to the truncated Reich, the Big Three appealed at Potsdam to the Polish, Czechoslovak, and Hungarian governments to suspend further expulsions until an "orderly and humane" program could be worked out. The German Refugee Administration in Berlin proposed a program, which went into effect Oct. 15, whereby 4,500,000 more Germans were to be evicted from Poland, Czechoslovakia, and Hungary during the winter of 1945-46. Whether this vast flood of newly evicted persons could be handled in an "orderly and humane" fashion at the appointed refugee centers in Germany was exceedingly doubtful.

ECONOMIC TERMS FOR GERMANY

The intended result of the Potsdam economic program was the "industrial disarmament" of Germany, as distinguished from the "deindustrialization" of the country. The major purpose of the Potsdam economic arrangements was to transform Germany from a nation whose economy was dominated by heavy industries into a country producing primarily food and consumers' goods and exporting only enough of these products and certain raw materials to import essential supplies.

The Potsdam plans provided that Germany's "war potential" should be eliminated, and the production of arms, ammunition, aircraft, and seagoing ships strictly prohibited. Instead, however, of calling for the destruction of all German industries which might be directly useful to a war economy, the Allies agreed to control the production of metals, chemicals, machinery, and other such items, and to restrict their output to Germany's "approved post-war peacetime needs." These needs were not to exceed the "average of the standards of living of European countries," excluding the United Kingdom and Soviet Union.

According to the terms of the reparations settlement, Russia secured a blank check for reparations in its own zone, where the Red Army had already dismantled large quantities of industrial plant and equipment, and the right to 25 per cent of whatever industrial capital the United States, Britain, and other countries entitled to reparations, removed from the western zones. Fifteen per cent of these reparations were to be conditional on deliveries to the British and American zones of food, timber, coal, potash and other resources from the Russian area, and 10 per cent were to be delivered without payment of any kind in return.

The amount of reparations to be collected was not definitely set, but February 1946 was set as the deadline for completion of the reparations bill, which was to be computed by the Allied Control Council under policies formulated by the Allied Commission on Reparations. Meanwhile the commanders in the western zones were to make advance deliveries of reparations to Russia from their areas. February 1948 was named as the terminal date for the collection of reparations in all four zones.

POLITICAL TERMS

According to the Potsdam agreement, one major political purpose of the Allied occupation was "to destroy the National Socialist Party and its affiliated and supervised organization," and to remove from public and semi-public office "all members of the Nazi party who have been more than nominal participants in its activities." To this end the Allies carried out a program of "denazification" in their respective zones, though not on an entirely uniform basis, for considerations of efficiency were in some cases permitted to outweigh ideological objections.

In another notable effort to impress on the Germans the necessity of seeking a new type of leadership in the future, the Allies brought Germany's former leaders to trial in Nuremberg on Nov. 20. These trials required months of preparation by the War Crimes Commission because of the lack of precedents and the differences among the judicial procedures of the various Allies.

At the Nuremberg trials the chief Nazis were charged with offenses falling into three categories: crimes against peace (including the planning and launching of aggressive war); war crimes (killing of hostages, devastation, and slave labor); crimes against humanity (racial, religious, or political persecutions, extermination, and deportations). Since such types of action had previously been attributed only to states as collective entities, one purpose of the trials was the establishment in international law of the principle of individual responsibility for war crimes and atrocities.

The Nazi leaders included in the first Allied indictment were: Hermann Goering, Rudolf Hess, Joachim von Ribbentrop, Robert Ley, Wilhelm Keitel, Ernst Kaltenbrunner, Alfred Rosenberg, Hans Frank, Wilhelm Frick, Julius Streicher, Walter Funk, Hjalmar Schacht, Gustav Krupp von Bohlen und Halbach, Karl Doenitz, Erich Raeder, Baldur von Schirach, Fritz Sauckel, Alfred Jodl, Martin Bormann, Franz von Papen, Arthur Seyss-Inquart, Albert Speer, Constantin von Neurath, and Hans Fritzche.

A second major political aim of the Allies in Germany, according to the Potsdam terms, was the re-education of the Germans along democratic lines. At Potsdam the Big Three agreed to allow and encourage "all democratic political parties," giving them rights of assembly and public discussion, and comparable rights were given to reviving trade unions throughout Germany. In the western zones, however, the occupying authorities did not actively encourage the growth and development of the political parties and trade unions. In the Russian Zone, on the other hand, the military authorities gave much more definite support to the appearance of German national parties, and directed them in such a way that four fairly well organized political parties emerged and formed an "anti-Fascist bloc." This bloc, consisting of Communists, Social Democrats, Christian Democrats, and Liberal Democrats, cooperates with the occupying authorities and forms the political basis for the various German administrations named by Red Army authorities. The Russians have also taken measures to change the basic economic and social structure of German life by breaking up the Junker estates and by depriving industrialists of their properties.

OCCUPATION OF AUSTRIA

The Allied military government of Austria, like that of Germany, is on a zonal basis, with each of the four powers occupying one area of the country and portions of Vienna, and matters pertaining to Austria as a whole are considered by all four military commanders sitting in the capital, but the methods and objectives of military government in Austria are substantially different from those in Germany. Although the program of denazification and demilitarization of

Germany is being extended to Austria, the Allies have announced their intention to promote conditions among the Austrians that will lead to the speedy establishment of a free and independent nation.

On the eve of Germany's military collapse in Austria, Moscow announced, on April 29, the establishment of a new government in Vienna. The provisional cabinet thus established under Russian auspices was a left-of-center coalition, headed by Dr. Karl Renner, a Social Democrat who was the first Chancellor of the Austrian Republic after the First World War. In view of the manner in which the Renner régime was established, rather than because of its composition, the Western Allies declined to recognize it until Oct. 20, when they did so on the condition that free elections would be held soon.

Elections for the Austrian national and provincial parliaments were held Nov. 25, and the Volksparti won a majority in the National Assembly. (Volksparti, 84 of the 165 seats; Social Democrats, 76 seats; Communists, five seats.) The small number of seats secured by the Communists indicated a protest by a large part of the urban population, as well as a large majority of the peasants, against the occupation of part of Austria by the Red Army, and the victory of the Volksparti revealed the amalgamation of a large number of political groups that had little in common except their opposition to the Marxist parties.

The new government of the Second Austrian Republic was established on Dec. 19, when the National Assembly was convoked, and the following day Dr. Renner was elected President for a six-year term by the unanimous vote of Parliament, and Leopold Figl, chairman of the Volksparti, was sworn in as Premier. The creation of this new Austrian Government was made possible, however, only through the achievement of general agreement among the occupying authorities. When the original list of cabinet members proposed by Figl was found to include three names which met with Russian objections, although the men in question had held posts in the Soviet-approved Renner régime, Britain, the United States, and France took the view that the important thing was to form a new government as soon as possible, and urged Figl to remove these names in order to secure Russian approval of his new cabinet.

ITALY

The first concrete action toward the restoration of sovereign independence to liberated Italy was taken by the Allies on Feb. 24, 1945, when the Allied Commission announced a series of changes in the relations of the Commission, which had hitherto enjoyed virtually complete jurisdiction over Italian affairs, and the Italian Government, which has exercised only shadowy powers. The Commission ceased to exercise "control" except in those military zones along the battlefront, where the AMG continued to function.

With the end of the period of close Allied tutelage over Italy, the Italian Government regained the freedom to conduct its foreign policy with Allied and neutral states, to issue laws and decrees without securing consent of the Commission, and to make all appointments of personnel in the administration on its own responsibility. At the same time, however, the Government's freedom of action remained contingent on the degree to which that action conformed with military necessities, and Italy remained a cobelligerent despite its efforts to gain full membership in the United Nations.

After the liberation of the north of Italy, the government of Premier Bonomi resigned, according to its pledge in this connection, and a new government was named on June 17. Ferrucio Parri, of the Action Party and a prominent Partisan leader in northern Italy, became Premier of a reconstructed government. The Parri government, like its predecessor, was beset by serious problems arising from the serious economic hardships in

Italy, and on Dec. 4 a Christian Democrat, Dr. Alcide de Gasperi, who had formerly been Foreign Minister, was named Premier. This change in government meant no real change in the political or economic program of the authorities in Rome, but merely indicated the existence of widespread discontent with any government in office and popular indifference as to what government might supercede it.

As long as the Allies made no definite peace settlement with Italy, Italy's future remained uncertain. As long as territorial future relationship to the United Nations remained unsettled, the government was unable to resume trade relations with other nations, to decide what to do with the bankrupt industries of the north, to take necessary steps to maintain international order, or to begin any of the other major jobs of reconstruction.

When the September meeting of the Foreign Ministers in London ended in stalemate and it became clear that a formal peace settlement with Italy would again be postponed, the Allies decided to publish the long-suppressed Italian armistice terms, signed Sept. 29, 1943. Contrary to earlier rumors, the terms did not deal with such problems as the disposition of Italy's colonial possessions, the final amount of reparations Italy should be expected to pay, or the question of the retention of the monarchy. Despite the fact that the actual terms were less severe than many Italians had feared and had been modified in important respects since they were originally made, they were among the sternest of any applied by the Allies to Germany's satellites.

THE ITALIAN COLONIES

When the future of the pre-Fascist Italian colonies in north Africa was discussed at the London Council of Foreign Ministers, it became clear that the Allies had widely different attitudes toward the question of their disposal. Russia, making a bid for an important position in the Mediterranean, asked for a Soviet trusteeship in the Italian colonies. Britain, primarily interested in preserving its lifeline to the Far East, wanted a settlement that would safeguard its traditional position. The United States, with less tangible interests at stake, was torn between the views that the colonies should be returned to Italy, as Italian representatives argued should be done, and the concept of international trusteeship.

The Arab League, in accordance with its campaign to secure the independence of predominantly Arabic lands, demanded that Tripolitania and Cyrenaica become independent. Meanwhile, the Ethiopian Government put forth a claim to Eritrea and Italian Somaliland. Anticipating rejection of its demand for independence, the Arab League proclaimed trusteeship an acceptable second choice—a trusteeship under the Arab League for Tripolitania and under either the Arab League or Egypt for Cyrenaica.

Despite these conflicting claims, Secretary of State Byrnes declared at the close of the London meeting of Foreign Ministers that "general agreement" had been reached in favor of trusteeship for the Italian colonies. He indicated, however, that the type of administration to be used, whether by an international authority or by a single designated state, had not yet been definitely agreed upon.

AXIS SATELLITES

At the Crimea Conference (see "The United States in Wartime and After"), the Big Three accepted joint responsibility for the policy that no temporary or provisional authorities in the former Axis satellites or liberated countries should block the eventual exercise of the peoples' right freely to choose the government and institutions of the post-war period. In the case of Hungary, all three major Allies were satisfied that the major requirements for a freely-chosen régime had been fulfilled. The new coalition, formed as a result of elections held on Nov. 4, was headed by Zoltan Tildy, leader of the Small Holders party—the conservative group that won a large majority of votes in the elections. However, economic ills, reflected in serious inflation, made the position of this elected government unstable.

In Finland, where the first post-war elections in Europe were held on March 17 and 18, 1945 a moderate trend toward the Left was revealed, although the Rightist parties led in the popular vote. Premier Juho K. Paasikive thereupon formed a Left-wing coalition government. In the general opinion of observers from the Western Allied nations, Finland was an example of a country situated on the frontier of the Soviet Union that enjoyed political independence, despite the fact that the payment of a $300,000,000 reparations bill to the U.S.S.R. placed the country firmly within the Russian economic sphere.

Rumania and Bulgaria continued to be a source of disagreement between the Western Powers and Russia. The Rumanian government of Premier Groza and the Fatherland Front régime in Bulgaria, in the view of Britain and the United States, were not representative of important democratic elements in those nations. At the London Conference, when the question of whether or not the Allies should make peace with these governments, Britain and the United States contended that the pledge made at the Crimea Conference could not be fulfilled in countries where freedom of speech and assembly were denied.

In an effort to assure Russia that the Western Powers did not object to the Bulgarian and Rumanian governments because they were friendly to the U.S.S.R., Secretary of State Byrnes declared in his official report on the London Conference that Moscow's special interests in the Balkans were recognized on the ground that "the peace of Europe depends upon the existence of friendly relations between the Soviet Union and its European neighbors."

The issue was again discussed at the December meeting of the Big Three foreign ministers in Moscow, and formulas were adopted which the United States and Britain admitted were not ideal but nevertheless constituted a compromise between their points of view and that of Russia. According to the decision of the Moscow Conference, the Rumanian Government, prior to its recognition by Washington and London, should be enlarged by the inclusion of one member each of the National Peasant party and the Liberal Party. This reorganized government was then to declare that "free and unfettered elections" would be held as soon as possible, under the supervision of an Allied commission composed of the American and British ambassadors to Moscow and Russian Foreign Vice-Commissar Vishinsky.

The situation in Bulgaria was more complicated than that in Rumania because elections were held on Nov. 18, which Russia viewed as fulfilling the requirements set up by the Crimea Conference for free elections, and the Western Powers did not consider satisfactory. In these elections there was an 88 per cent vote for the Fatherland Front, consisting of the Communist, Agrarian, and Social Democratic parties, and the Opposition declined to participate on the ground that it was not given an equal opportunity at the polls. In an attempt to harmonize Russian and Western views toward the Bulgarian situation, the Moscow Conference decided that the Soviet Union should give "friendly advice" to the Bulgarian cabinet "with regard to the desirability" of including two additional representatives of "other democratic groups." Once this was done, the United States and Britain agreed to recognize the Bulgarian Government, thus paving the way to the conclusion of peace with this former Axis satellite.

FRANCE

During the early months of 1945 the refusal of the de Gaulle provisional government to carry out fundamental social and economic changes until national elections had been held caused some surprise among former members of the resistance movement because of de Gaulle's earlier statement in behalf of far-reaching reforms. De Gaulle's unwillingness to make rapid strides toward the Left apparently reflected not only his personal preference for moderate rather than drastic change but his belief that such actions by an authority which did not yet have a legal basis might divide France and interfere with its efforts to regain military power and prestige abroad.

Meanwhile, pressure for immediate reforms mounted within the ranks of Leftist groups that had formerly been among de Gaulle's strongest supporters. During the first quarter of 1945 the Consultative Assembly and the Socialist and Communist parties all went on record in favor of the immediate nationalization of important banks, principal sources of raw materials and power for key industries, transportation and insurance companies.

In the national elections, held Oct. 21, the widespread desire of the French for something new was clearly indicated. In response to the question whether they wished to return to the Third Republic or establish a Constituent Assembly that would lay the foundations of a new régime, approximately 96 per cent of the voters approved of the latter proposal. The wish for a break with the past was further underlined by the almost total eclipse of the Radical Socialist Party, one of the strongest political groups during the Third Republic, the general disintegration of Rightist groups, and the emergence of the Communists as the single largest party.

At the same time, the French seemed to show a desire for a more stable government than they had had during the pre-war period. More than 13,000,000 voters approved the proposal, strongly backed by General de Gaulle and opposed by the Communists, that the Constituent Assembly should have certain limitations imposed on its powers, while only approximately 6,500,000 voters favored an Assembly unchecked by the executive. Nevertheless, there were two political crises before the end of the year, both of which seriously threatened the government formed by President de Gaulle after the elections. The first was precipitated by the Communists, who sought to name members of their party to three key posts in the cabinet. The second was brought about by the Socialists and Communists, who sought to reduce military credits in the general budget. On both occasions de Gaulle's threat to resign was effective in securing a compromise, for he continued to be regarded as indispensable and to enjoy prestige as "the first resister."

Prior to the elections, the three major parties—Communists, Popular Republican Movement (MRP, a new party with predominantly Catholic membership which developed during the period of resistance), and the Socialists—joined in supporting the program of the Conseil National de la Resistance, drawn up in 1944. Despite their agreement on this program for sweeping economic and social reforms, there were important differences among the parties. Bitterness over the position of the Communists in 1939-40 still complicated relations between the Communist Party and other groups. Both the Socialists and the MRP, moreover, felt that the Communists were politically irresponsible in their demands for wage increases and lack of concern about inflation. The Communists, for their part, accused the Socialists of betraying workingclass unity and claimed that members of the MRP were disguised reactionaries.

On foreign policy, as well as on domestic questions, the parties were divided, with the Socialists and MRP in favor of closer association with the West, and the Communists bitterly opposed to this measure as constituting a "western bloc" against Russia. De Gaulle's personal enthusiasm for the alliance with Russia cooled noticeably after Stalin opposed the invitation of the French leader to the Yalta Conference, and his visits to Washington and London at the end of the summer indicated his belief that closer relations with the Western Allies were needed to solve France's problems abroad. Of these problems one of the most important was that of the disposal of the Rhineland and Ruhr. De Gaulle maintained that the security of France required that the Rhineland be permanently detached from Germany and placed under an autonomous government and the Ruhr be placed under an international administration. By the end of 1945, however, none of the other major Allies had approved any plans for changing the old German western frontiers.

BELGIUM

In Belgium the question of the position of the King kept the country agitated and divided. The Catholic Party, which drew its support primarily from Flanders, one of the nation's two ethnic regions, demonstrated attachment to King Leopold III, while the Socialists, Communists, and Liberals, whose largest following was found among the Walloons, opposed him.

During its years as a government-in-exile, the Pierlot cabinet had maintained the official view that, despite the disagreement between the monarch and his chief ministers at the time of Belgium's collapse in May 1940, when the King capitulated and became a *de facto* prisoner of the Germans rather than accompany his ministers into exile—the King was a patriot and a supporter of the Allies. Leopold for his part, did not encourage or welcome reconciliation with the government-in-exile during the period of the German occupation of Belgium. Following the King's liberation by the American Army in May 1945, the government again approached him and proposed that he make certain gestures upon his return to demonstrate his enthusiasm for the Allied cause. He moved slowly in carrying out these measures and, as a result of this fact, and also because of Leopold's voluntary visit to Hitler at Berchtesgaden in November 1940, the government decided to request his abdication.

The King's reply, contained in a letter to the Regent on July 18, declared that, for the time being, he wished neither to resign nor abdicate but to wait until such a time as public opinion had clearly manifested itself on the question of his return or abdication. The end of the constitutional crisis was thus postponed until there had been an expression of public opinion in the elections of 1946, when the King apparently believed Parliament would have a majority favorable to his restoration.

THE NETHERLANDS

Holland was one of the last nations to be liberated from the Nazis, for the Allied armies that swept across France and Belgium during the autumn of 1944 cleared only three provinces. The rest of the country remained under German control, and during the winter of 1944-45 there were acute shortages of fuel, power, and food. Moreover, in their last attempts to delay Allied advances in Holland, the Nazis resorted to floodings that not only left thousands of persons homeless but intensified the food problem by making it highly unlikely that crops could be grown in these areas for several years to come.

With the final liberation of Holland by the Allies in the spring of 1945, Prof. Willem Schermerhorn, a prominent leader in the Dutch underground resistance movement throughout the occupation, became Premier, following the resignation on May 16 of Premier Gerbrandy, who had promised to leave office as soon as all Holland was liberated.

Economic problems remained uppermost throughout the year and led to popular demands that the Allies open the German frontier and permit the Dutch to take coal from Germany. Numerous appeals for aid from abroad were also made by Dutch spokesmen. Despite the country's economic difficulties, no important political crises developed, and Queen Wilhelmina remained one of the few unchallenged monarchs in Europe. She returned to Holland on May 3.

NORWAY, DENMARK, AND SWEDEN

The Scandinavian countries continued to be among the most stable in Europe. The general elections held in Norway on Oct. 8 and in Denmark on Oct. 30, the first since the war's end, showed that these countries wished to keep their time-tested systems of democratic government. Extreme Leftist groups made few gains.

Norway was the last European nation to be liberated from the Axis. Crown Prince Olaf, Commander-in-Chief of the Norwegian forces, arrived in Oslo on May 8 and proclaimed the capitulation of the German forces that had occupied the country since June 9, 1940. King Haakon VII returned to Norway on June 7. Vidkun Quisling, Premier under the Nazis, was convicted as a traitor on the charge of having aided the German invasion and was shot on Oct. 24.

The Norwegians emerged impoverished from the war years, and their leaders acknowledged that it would require many years to reach pre-war economic levels. One of the nation's greatest economic assets, its mercantile and fishing fleet, was one of the casualties of the war. Denmark, on the other hand, probably suffered least of all the countries occupied by Germany, since it was used by Hitler as a "model protectorate," at least during the early part of the occupation. Sweden, as a neutral, also suffered little from the war, and its sound financial position permitted it to extend credits and relief to the war-stricken Northern countries. At the end of 1945 this aid totaled over 3,000,000,000 Swedish crowns (approximately $600,000,000).

POLAND

The question of Poland, which had disturbed relations between Russia, on the one hand, and Britain and the United States, on the other, since April 26, 1943, when the Kremlin severed relations with the Polish government-in-exile, which the Western Powers continued to recognize, remained a source of friction among the Allies during most of 1945. Russia, determined that a government friendly to the Soviet Union should be established in Poland, wished to have the Soviet-sponsored government, which was first established in Lublin and subsequently transferred to Warsaw, and officially recognized by Moscow on Jan. 5, 1945, accepted by the other powers. The Soviet Union made it clear that it opposed the replacement of this régime lest a new government include elements opposed to the U.S.S.R. The Western Allies, on the other hand, contended that Poland, as one of the first victims of the Nazis and a liberated nation, was entitled to a more broadly representative government than that inspired by the Soviet Union.

In an effort to secure a compromise on Poland, the Big Three agreed at the Crimea Conference that Russia's claim to the Curzon Line as the eastern boundary of Poland should be recognized and provided that the provisional régime of Poland should be "more broadly based than was possible before the recent liberation of Western Poland." A commission, composed of Russian Foreign Commissar Molotov and the American and British ambassadors in Moscow, W. Averell Harriman and Sir Archibald Clark Kerr, was to consult with "members of the present provisional government and with other Polish democratic leaders from within Poland and from abroad, with a view to the reorganization of the present government" along more democratic lines.

These negotiations became deadlocked, however, on the question of which "democratic leaders" among the Poles at home and abroad should be added to the provisional government. Unable to reach an agreement, Russia requested that the Warsaw authorities be seated at the San Francisco Conference of the United Nations as the recognized government of Poland. Britain and the United States continued to refuse to accept the Moscow-supported government, and the resulting friction was increased by the trial in Moscow of 16 Poles, most of whom had had connections with the government-in-exile, who were accused of "diversionary activities" in Poland during the war. On June 16, in a new effort to end the stalemate, Stanislav Mikolajczyk, former Premier of the government-in-exile, went to Moscow, and upon his inclusion in the Warsaw régime, headed by President Bolislaw Bierut and Premier Edward Osubka-Morawski, the United States and Britain agreed to recognize this revised Polish régime on July 22.

YUGOSLAVIA

In a further attempt to secure agreement among the Big Three on Yugoslavia, another source of inter-Allied friction, the Crimea Conference proposed that the government-in-exile and the *de facto* régime of the Partisans should form a unified government. In accord with this plan, which called for implementation of the Tito-Subasitch agreement of November 1944 to merge the exiled forces under Premier Subasitch and the Partisans under Marshal Tito, a single administration was formed in Belgrade on March 9. The two Yugoslav groups also agreed that a plebiscite should be held on the question of the monarchy, and in the meanwhile three Regents, representing the Serbs, Croats and Slovenes, were appointed.

In this first unified régime that Yugoslavia has had since the Partisans began to form their underground administration in opposition to the Axis in 1941, Tito became prime minister and Subasitch was appointed foreign minister, thus emphasizing the predominant role of the Partisans in the new government. These arrangements were upset, however, by two subsequent events: the resignation of Dr. Subasitch, on Oct. 8, as a result of a dispute with Marshal Tito over the alleged undemocratic laws governing the elections held Nov. 11, and the proclamation of Yugoslavia as a republic by the Constituent Assembly on Nov. 29. In response to this latter action, King Peter immediately issued a statement from London charging Tito with having taken the constitutional decision out of the hands of the people. Tito replied that the support he had received in the elections made a plebiscite on the monarchy unnecessary, and there appeared little doubt that King Peter's reign had, in fact, ended. The United States and Britain recognized the new Federative Peoples Republic of Yugoslavia on December 22, although the Department of State declared that "it cannot be said that the election conducted on November 11 provided opportunity for a free choice of the people's representatives."

GREECE

The civil war in Greece that began early in December 1944 between the EAM, the Anti-Royalist and Leftist resistance movement, and the British supported government forces, continued until the middle of January, 1945, and negotiations for a peace were concluded on Feb. 12. According to the terms of the peace, known as the Varkisa Agreement, the Greek authorities promised the Leftists and Anti-Royalists preservation of democratic liberties, cessation of martial law, release of hostages, and an amnesty for the EAM. In addition, the terms called for the raising of a national army, a purge of collaborators and Metaxists from the administration, and the holding of elections and a plebiscite on the future of the monarchy.

On April 7, the Plastiras government, which had been in power during the civil war, gave way to a government, headed by Vice Admiral Voulgaris. The basic reason for this change was the conviction on the part of the royalists that Plastiras, who had been known as a republican, might be an obstacle to the return of King George II. Although the Voulgaris government differed from its predecessor on the constitutional issue and favored royalist officers in the Greek army, it faced the same basic economic and political problems and met with little success in coping with them. The resulting widespread unrest led to numerous strikes and to the sweeping success of EAM-Communist candidates in trade union elections in Athens and Piraeus. In the political field, relations between EAM elements and the government remained troubled, and EAM leaders charged the government with breaking its pledges made under the Varkisa Agreement.

With the advent of the Labor Government in Britain, Prime Minister Attlee telegraphed Regent Archbishop Damaskinos that the British Government was concerned over reports of "right-wing excesses in contravention of the Varkisa agreement." The earlier British policy of opposition to the EAM, however, was by no means entirely reversed. Foreign Minister Bevin expressed his opposition to any change in the Voulgaris government before elections, which promised to be favorable to the royalists if they were held soon. The British Government, whether Conservative or Labor, clearly wished to see friendly governments along its traditional life-line to the Middle and Far East, just as Russia insisted upon pro-Soviet régimes along its borders.

Despite Britain's opposition, members of the Greek Liberal Party criticized the Voulgaris government's election plans so strongly that the cabinet was obliged to resign on Oct. 9. In an effort to lessen the resulting tension between the royalists and their opponents, the Regent took over the premiership until Nov. 2, when Prof. Kanellopoulos formed a new government. By Nov. 20, this régime had also fallen and the Liberal leader, Themistocles Sophoulis, formed a new government supported by centrist elements and those slightly left-of-center (but not including representatives of the EAM), on the understanding that the plebiscite on the King's return should be postponed until March 31, 1946, by which time he apparently believed the royalists would have lost some of the strength they had gained in the civil war.

SPAIN

After V-E Day, General Francisco Franco made repeated efforts to present the world with the picture of a reformed Spain in the hope of improving his relations with the Allies. Highlights of Franco's attempts along this line were the termination of diplomatic relations with Japan on April 12 and some moves toward the easing of political restrictions within Spain. On July 13, a new "bill of rights" was approved and municipal and provincial elections were promised, as was the restoration of some civil liberties, including freedom of the press. Occasional changes were also made in the cabinet in an effort to satisfy various political factions that the régime permitted to exist, and on July 17 Franco also appealed to pre-Republican traditionalists by stating his intention of eventually restoring the monarchy.

Opposition to Franco continued to be divided, both within Spain and among Spaniards in exile, on all questions except a common desire to oust El Caudillo. The government-in-exile in Mexico City, of which José Giral was named Premier on Aug. 22, was at odds not only with the Spanish Communists but also with Juan Negrin, the last Prime Minister of republican Spain. On Dec. 28, Dolores Ibarruri, secretary-general of the Spanish Communist Party, wrote to all the anti-Franco exiles proposing a meeting in Paris to work out an agreement for overthrowing Franco.

The opposition of the Allies toward Spain continued to be modified by the fear of a new civil war in the event of the overthrow of Franco. Although the Big Three declared at the Potsdam Conference that Spain would be barred from the United Nations Organization as long as it remained under Franco's rule, and both President Truman and Foreign Minister Bevin voiced their governments' disapproval of Franco, they hesitated to take more positive action. When France invited Britain and the United States early in December to disclose their attitude toward severing diplomatic relations with Franco, it appeared unlikely that the Allies would easily overcome their fear of chaos in Spain or readily agree on the kind of successor régime they would be willing to support.

THE VATICAN

The long-anticipated increase in the internationalization of the Sacred College of Cardinals became an actuality on Dec. 23, when Pope Pius XII named 32 prelates from 19 countries to become Cardinals at a secret consistory Feb. 18, 1946. For the first time within the modern history of the Church the Sacred College was thus brought to its full membership of 70, and a number of nations not hitherto represented in the College secured members. North and South America, which had previously been represented by three cardinals, were given a total of 14, and China, Australia, Cuba, and Chile, who had never before had members in the Sacred College, were given one Cardinal each. The four new prelates from the United States who were named to join Dennis J. Cardinal Dougherty of Philadelphia, the only living American member of the College, were Archbishops Francis J. Spellman of New York, Edward Mooney of Detroit, Samuel A. Stritch of Chicago, and John J. Glennon of St. Louis.

The significance of these appointments was discussed by Pope Pius in his annual Christmas allocution to the Cardinals. Emphasizing that the Catholic Church is supra-national by its very nature and that "at a time of stress such as ours still is," the Church "must be now more than ever supra-national," he declared that he had been "anxious that the greatest possible number of races and peoples should be represented, so that this creation may portray in a living manner the universality of the church . . . Rome will thus be seen in its true light as the Eternal City . . . the city which is the See of the Vicar of Christ, on which the gaze of the whole Catholic world is fixed."

THE WAR IN THE ORIENT AND THE PACIFIC

By Gilbert Cant
Contributing Editor, *Time Magazine*

APPROACHING DEFEAT FOR JAPAN

By the end of 1944, the forces of the United Nations converging upon Japan had cut through the enemy's vast, outlying defense system at a number of points, and were attacking positions which, although still technically "outposts," were properly a part of the inner defenses.

From the Aleutians there was a modest but continuous bombing and reconnaissance campaign against the Kuril Islands; advancing from the southeast, American forces under Admiral Nimitz had consolidated their hold upon all the islands which they needed in Micronesia (bypassing the rest), and from the Marianas there had begun the strategic bombing of Japan itself by B-29 Superfortresses; in the South, forces under General Douglas MacArthur had won footholds in the Philippine Islands, at Leyte and Mindoro; in southeast Asia, the Allies had the initiative, with a predominantly British offensive being pressed in Burma.

Only in China had the enemy enjoyed any recent success, and even there Chinese National Army divisions were being retrained and reequipped by American units, so that the outlook for the future, with the prospect of a major counter-offensive, was far more favorable than at any time since Pearl Harbor.

It was still true that the United Nations held no position closer to Japan than Saipan—1,350 miles from Tokyo—and that the next island stepping stones on the route of the Allied advance would be 700 or more miles away from the main island of Honshu. By pre-1945 standards, therefore, it would have been possible for the

Japanese to feel that they were still well protected by distance. However, military distances had been foreshortened by technology, and this process was being accelerated, notably by increases in the effective range of aircraft. The Japanese capital was already under attack from Saipan; if Admiral Nimitz's forces should advance one more step, to the Volcano or Bonin Islands, they would bring Tokyo and its neighboring beaches within fighter plane range, the prerequisite to successful invasion.

Moreover, although most of the Philippines had not yet been invaded for reconquest, these islands, and the still more valuable East Indies beyond them, were already lost to Japan as a source of supplies. During the first three years of the Pacific war, United States and Allied submarines had borne the main burden of the blockade of Japan; now, with air bases under construction at Mindoro, on the shore of the south China Sea, the blockade could be made virtually leak-proof as far north as Formosa. The Japanese had already lost millions of tons of irreplaceable shipping on the more remote sea routes; now, they could expect to feel the pinch of blockade on their inner lines of communication also.

THE STRATEGIC POSITION

Thus, the plight of the Japanese was actually worse from a strategic viewpoint than a mere casual survey of the geographical positions occupied by the opposing forces would indicate. On the other hand, there was one important respect in which geography put the United Nations forces at a disadvantage, even after the techniques of waging amphibious warfare across great oceanic distances had been perfected. This was in the absence of a large land area, preferably within fighter plane range of Japan, where large Allied armies could be staged and combat-loaded in preparation for an assault upon the beaches of Kyushu and Honshu. To put it another way, there was no position in the Pacific which could correspond to the island of Great Britain in the operations directed by General Eisenhower against German-held Europe. The nearest equivalent was Luzon, 20 times as far away from Japan as was southwest England from the beaches of Normandy.

Although there was bitter fighting (of the kind too often dismissed lightly as "mopping up") at a number of bypassed positions in the southwest Pacific, the only offensive through the islands which was being decided at the opening of 1945 was on Mindoro in the Philippines. Indeed, this had already been decided for all practical purposes, scarcely more than two weeks after the invasion, for infantry operations had settled down to a pursuit of Japanese stragglers, and airfields near San José, facing the south China Sea, were already being used by fighter planes.

PRELIMINARY OPERATIONS IN THE LIBERATION OF THE PHILIPPINES

These airfields were the key to the entire campaign for the liberation of the Philippines and the securing of Luzon as a springboard for expected use against Japan. The airfields on Leyte (invaded two and a half months earlier) had proved inadequate to extend Allied air control over the western and northern Philippines, because they were on the rainy side of the islands. Mindoro was not only drier, it was much nearer to possible invasion points on the coast of Luzon, and therefore infinitely more valuable as a fighter base.

The Japanese sent only a few infantry reinforcements to Mindoro, in contrast with the great numbers which had been funneled into Leyte, and made only a single, abortive foray with heavy surface ships in an attempt to destroy the beachhead. Their principal defense consisted of suicide planes of the *Kamikaze* Corps, with which they caused a large number of casualties among American supply ships and supporting craft.

The bold move to seize Mindoro having quickly succeeded, it was possible to mount the invasion of Luzon without delay. General Yamashita's dispositions for the defense of Luzon, as he later testified, had been upset during the campaign for Leyte; in January, he still had too many troops in the southeastern peninsula (Legaspi) and in the southwestern peninsula (Batangas, opposite Mindoro). Within the broad directive issued by General MacArthur, it was incumbent upon General Walter Krueger, commanding the American Sixth Army, to decide just where the landing should be made on Luzon, and he picked Lingayen Gulf, as far north of Manila as Mindoro was south of the capital. Although the added distance increased the hazards in some respects, the decision was justified because the Japanese little expected the first landing to be made there, and because the Central Plain stretching from Lingayen to Manila offered the best approach to the capital.

To isolate the battlefield, the Third Fleet under Admiral William F. Halsey, with its carriers organized in Task Force 38 under Vice Admiral John S. McCain, carried out extensive sweeps beginning on Jan. 3, 1945. First, Formosa was attacked; next, airfields on Luzon itself were the target; Formosa again, and then the fleet sallied into the south China Sea to neutralize Japanese bases in French Indo-China and to guard against interference by enemy fleet units with the American operations at Lingayen Gulf.

These had begun on Jan. 6, when a squadron of old battleships opened the preliminary bombardment of the prepared Japanese defenses. These vessels, like the amphibious fleet which followed them under Vice Admiral T. C. Kinkaid, could not be fully protected by land-based aircraft, so highly vulnerable escort carriers were sent in with them to furnish air support. Even so, many Kamikaze planes got through; the small carrier *Ommaney Bay* was sunk; no less than three battleships (*New Mexico, California,* and *Mississippi*) were hit, and many other ships were sunk or damaged. The enemy was less successful with other unorthodox defenses, such as suicide boats and one-man torpedo rigs.

BATTLE OF THE PHILIPPINES

On Jan. 9, the 6th and 43rd Infantry Divisions of Major Gen. I. P. Swift's I Corps were landed on the northeast shores of Lingayen under the fire of Japanese batteries which had survived the withering bombardment. The 37th and 40th Infantry Divisions of Major Gen. O. W. Griswold's XIV Corps were landed to the south, under difficult beach conditions. The Japanese elected to defend the beaches only with artillery and mortars sited in the hills to the northeast; consequently, the I Corps became engaged in a close and bitter struggle for small areas of difficult terrain, while the XIV Corps spread rapidly south, toward Manila.

Several natural defense lines along the route to Manila, where the enemy might have been expected to offer determined resistance, were swiftly overrun against nominal opposition. Even the great air base system of Clark Field was allowed to fall before the Japanese began to fight savagely and futilely in the near-by hills. To guard against a Japanese withdrawal into Bataan, the 24th and 38th Infantry Divisions of the XI Corps were landed at San Narciso, north of Subic Bay, on Jan. 29, and began to cut across the base of the peninsula. A triple envelopment of Manila became possible when part of the 11th Airborne Division was landed (from boats) at Nasugbu, southwest of the capital, and the 511th Parachute Infantry Regiment dropped from the air on Tagaytay Ridge, closer to the city.

THE FALL OF MANILA

Meanwhile, the 37th Division had fought a sharp action to cross the Pampanga River at Calumpit, and the 1st Cavalry Division (dismounted) had been rushed south from Lingayen by truck, to outflank Manila from the northeast. The infantrymen had to fight their way through the northern suburbs; the cavalrymen effected their flanking movement and drove into the city on Feb. 4, to relieve the American and other Allied civilians interned at Santo Tomas University.

On the northern bank of the Pasig River, which bisects the city, the Japanese began to fight with their characteristic tenacity, the absence of which during the earlier stages of the Luzon operation had caused great surprise. They set demolition and incendiary charges which destroyed much of the business district, then blew up the bridges over the Pasig. When the Americans forced a crossing of the river under fire, the Japanese began to fight for the southern half of the city, block by block, building by building and, in some cases, room by room. The old Spanish walled city, Intramuros, proved to be a natural fortress even against modern artillery; the Japanese made its capture more difficult and costly by holding Filipino civilians as hostages and using them as human shields. During this period, there were numerous cases of large-scale butchery and rape which became major issues later in the war-crimes trials of Japanese commanders.

It was not until the end of February that Manila was cleared of the enemy; by then, the entire southern half of the city and a substantial part of the northern half had been utterly destroyed. The waterfront was a shambles, inaccessible to shipping, and the bay was cluttered with wrecks. However, a combined paratroop and amphibious operation beginning on Feb. 16 had resulted in the speedy recapture of Corregidor Island, in the mouth of the bay; this made it possible for minesweepers and demolition teams to commence clearing the bay. By April, scores of large vessels were using the bay as an anchorage, unloading by lighter, and during that month some of the docks were restored to permit faster and more efficient unloading by crane. Thus, with Manila as a port of entry, the building up of Luzon as a base for northward operations was begun, even while the campaign to liberate the rest of the island was still in progress.

RECONQUEST OF THE PHILIPPINES

There were several points on Luzon where the Japanese continued to offer fanatical resistance, long after the island had been lost to them for all strategic purposes. The most notable of these were around the Ipo and Antipolo dams, on which the city depended for its water supply, in the mountains east of Manila, and the Balete Pass and Villa Verde Trail, leading into the Cagayan Valley far to the north. The valley was cleared of Japanese only after the enemy had been trapped by a force moving south from Aparri, and in these operations guerrillas played a notable part.

By late July, General MacArthur was able to announce that the Luzon campaign had ended except for "minor mopping-up." What this could mean was apparent from experience on Leyte: that island had been declared secure on Dec. 26, 1944, yet in the first six months of 1945, no less than 26,000 Japanese were reported killed in mopping up.

Meanwhile, the campaign for liberation of the central and southern Philippines had progressed rapidly. In March, there were landings on Palawan and on the southwestern peninsula of the great island of Mindanao, at Zamboanga. The seizure of airfields at these points extended the blockade over the south China Sea, and made the cutting-off of bypassed islands much more effective, and also prepared for an extension of the offensive southwestward, through the Sulu Archipelago to Borneo.

Mindanao, with its sprawling peninsulas, was treated by the American command as though it were a group of islands. No attempt was made to advance overland, through difficult mountains and jungle, from Zamboanga to the central part of the island; instead, a second landing was made in mid-April in the Cotabato-Malabang area on Illana Bay. From here, good roads led eastward through easier terrain to Davao, the principal city on the island, where the Japanese had been commercially entrenched in peacetime. A subsequent landing southeast of the city caught the Japanese garrison in a hopeless position, forcing the enemy to flee into the jungle to the north, where they were in process of being destroyed piecemeal by American and guerrilla troops.

During this period, also, landings too numerous to recite were made on the islands in the Visayas group, in the central Philippines, and the whole archipelago had been effectively liberated when hostilities ceased.

NETHERLANDS EAST INDIES

The expulsion of the Japanese from the Netherlands East Indies was begun on May 1, when Allied forces attacked Tarakan, a small island rich in oil off the east coast of Borneo. The assault troops were Australian; the amphibious group was American; the supporting warships and air forces were both American and Australian. Several other Borneo operations had been planned, but the only two executed were those against Balikpapan, south of Tarakan on the Strait of Macassar, and the Brunei Bay area on the northwest coast of the island, where Sarawak abuts on British North Borneo. The oil from these areas had long since been denied to the Japanese by the submarine and air blockade; the main purpose in recapturing them was to make the oil available to Allied fleets and thus economize in the use of tankers. Some of the oil was so pure that it could be pumped direct into ships' bunkers, without refining. Brunei Bay was also desired by the British for development as a naval base, since their Pacific Fleet was based on Sydney, too far to the rear, and could make only limited use of Manus in the Admiralty Islands. All three positions had been effectively secured, and the work of equipping them for Allied use had started, when the need for them was removed.

In consequence of the Japanese surrender, other offensive operations which had been planned in the southwest Pacific became unnecessary. It should be noted, however, that before this occurred, the responsibility for liberation of the Netherlands Indies had passed from General MacArthur to Admiral Lord Louis Mountbatten, in the adjacent Southeast Asia Command.

THE OFFENSIVE IN BURMA

In this theater, the varied Allied forces assembled under Admiral Mountbatten enjoyed uninterrupted successes throughout the period under review, in a continuation of the offensives launched in 1944 after the defeat of the Japanese attempt to invade India. The Burma front of 700 miles was the longest land front in Asia, and it was as nearly continuous as the north-south series of mountains and valleys permitted.

To the northeast, combat operations were under the Northern Combat Area Command of Lieut. Gen. Daniel I. Sultan, U.S.A., who had succeeded Lieut. General Joseph W. Stilwell in this duty. His troops included three Stilwell-trained Chinese divisions, the British 36th Division and the American Mars Force (successor to Merrill's Marauders) of about two brigades. Their mission was to open a way for the combat engineers, under Brig. Gen. Lewis A. Pick, to extend the Ledo Road until it joined the old Burma Road and restored the overland supply route to China. As 1945 opened, Sultan's forces had consolidated their hold on Bhamo, south of Myitkyina, and had turned northeast, toward Yunnan Province, for a junction with a Chinese army advancing to meet them. Scattered Japanese pockets, especially those in the mountains around Tengchung, resisted bitterly to delay the opening of the road as long as possible, but by Jan. 23 Admiral Mountbatten was able to announce that the junction of the armed forces had been effected, and a week later the first overland communication with China since April, 1942, was established.

On the central Burma front, the British Fourteenth Army under Lieut. Gen. Sir William Slim was engaged.

It comprised 10 to 12 divisions during this period, and with supporting troops, represented 250,000 men from the United Kingdom and 500,000 from India and Africa. In December, this force, having emerged from the mountains, had forced a crossing of the Chindwin River and was rapidly exploiting it in a drive down the broad, central valleys toward Mandalay. The Japanese strength had been broken in the previous year's campaigns, and the enemy fell back in disorder, helpless to stem the advance of a superior force which had the advantage of absolute aerial control, achieved by several Allied air forces operating under S.E.A.C.

In the first seven weeks of 1945, several important positions were captured; on Feb. 19 a bold flanking maneuver was completed by a mechanized column which struck through roadless jungle to take Meiktila, headquarters of the Japanese Fifteenth Army, 80 miles south of Mandalay. With the prompt seizure of Thazi, 14 miles east of Meiktila, a substantial Japanese force was trapped. The Japanese exerted heavy pressure on the British flanking force in an effort to break out to the south before the arrival of the main British force from the north, but with only partial success. Organized resistance at this point ended on March 5; four days later, the first tanks from the north rolled into Mandalay. The capture of the city took 11 days, largely because the Japanese remnants holed up in major buildings which the British, for political reasons, preferred not to destroy. A notable feature of the mopping-up stages of this campaign was the cooperation which the Allies received from the Burmese National Army, despite the strong nationalist aspirations and the years of Japanese influence.

By April 25, a rapid advance (some divisions traveling as much as 100 miles a week) resulted in clearing the Japanese from the oil-field area around Yenangyaung; on the last of the month, Pegu was bypassed, and there was no major obstacle between the Fourteenth Army and Rangoon.

However, the capital of Burma was retaken by different means. For more than two years, the British command had been conducting a campaign in the Arakan district of the west coast, aimed at the capture of Akyab. More than once, this undertaking had come near to disaster, and the plan to make an amphibious advance along the coast had had to be abandoned early in 1944 because of the diversion of landing craft to Europe. However, the Japanese were greatly weakened in the Arakan by the end of 1944, and on New Year's Day the British-Indian XV Corps retook Rathidaung. Small-scale amphibious operations had at last become possible, and on Jan. 5, 1945, landings were made which resulted in the reoccupation of Akyab. The enemy had virtually withdrawn. Akyab, and other positions down the coast which were occupied in succession, made it possible to effect landings on May 2 on both sides of the river south of Rangoon. The following day, the city was entered.

The Japanese campaign in Burma by this time had degenerated into an effort to maintain a semblance of organization while the defeated forces withdrew eastward into the Shan Hills or southeastward into Thailand. Well into the monsoon season the British-Indian forces, now supported by Burmese, fought a little-noticed campaign to prevent this Japanese withdrawal.

THE WAR IN CHINA

All Japanese operations in China during the early months of 1945 were of a puzzling, and sometimes inconsistent, nature unless their underlying strategic purpose was understood. The enemy was not primarily concerned with the threat posed by the Chinese armies, since these were not yet reorganized, retrained, or reequipped in sufficient number to be formidable. The Japanese were most exercised about maintaining their communications and thus their freedom of movement, and the greatest obstacle to them was the growing effectiveness of the Fourteenth Air Force. Despite the loss of its main chain of bases along the Hengyang-Kweilin line late in 1944, this air force under Major Gen. Claire L. Chennault had contrived to maintain, by air supply, a still more advanced series of bases in the Nationalist-held "island" between the Japanese-held corridor and the Japanese-held coast.

Thus it was natural that when the Japanese, in mid-January, began a drive from both ends, which they already held, of the Canton-Hankow railway, to squeeze the Chinese out of the intervening 250-mile gap, the operation quickly developed into an offensive against these advanced American air bases, such as Suichwan. This was scorched and abandoned on Jan. 24, and fell within a week. Namyung, important not only as an air base but as a source of wolfram, soon followed, and also Kanhsien. By Feb. 11, with the loss of Sincheng, the last of the advanced bases was gone. However, the Japanese derived little benefit from their apparent success: the Fourteenth was receiving longer-range aircraft, which operated as far as the south China Sea, and the Chinese kept cutting the lines of communication, including that along the Hankow-Canton railway, which the Japanese had fought so hard to secure.

By early March, the Japanese had begun a process of redeployment which was not at first understood, and Chinese armies, rapidly improving in quality, closed in, quickly recapturing Suichwan. However, before the end of the month, the enemy opened a new "defensive-offensive" to knock out the U. S. air base at Laohokow, 190 miles northwest of Hankow, to increase the security of the Peiping-Hankow railway. The base was abandoned on March 26. Early in April, moving out from the captured base of Paoking, the Japanese drove against Chihkiang, also the site of American airfields.

At this time, following the Soviet Union's denunciation of its nonaggression pact with Japan, enemy moves which had been confusing began to fall into a discernible pattern: a continuous northward movement of troops was under way—from Indo-China and southern China into Central China, and from there to Manchuria. Some divisions of the Kwantung Army which had been shipped south from Manchuria were either returned or replaced by troops of inferior quality. At the same time, Japanese forces along the coast, which had been scattered in pockets, were redistributed in the areas where it was believed they would be most effective in repelling an Allied landing which had become an apparent possibility after the invasion of Okinawa.

At the beginning of May, the Japanese withdrawal was evident, and Chinese armies which had been trained under American guidance and operated with American advisers and technical services, in conjunction with American air forces, fell upon the enemy. The Chihkiang drive was aborted and several ports, including Foochow, were entered. Toward the end of the month, the Chinese began an offensive in the south, toward Indo-China. A similar drive resulted in the capture of Nanning a week later, thus cutting into the flank of the Japanese north-south corridor.

On June 8, Chinese forces reached the Indo-China border near the coast. Farther north, there was a series of coastal drives to open the way for expected Allied landings; the Japanese were fighting only delaying actions in a general retreat toward such strongholds as Shanghai. On June 18, Nationalist armies retook Wenchow.

Throughout July, attention was concentrated on the mopping-up in the south and southeast, and the recapture of American air bases. Liuchow had been re-entered at the end of June, and was followed by Tanchuk on July 9; Kanhsien on July 14; Namyung on July 25; and the shattered shell of Kweilin itself in the last hours of the month.

The best of the American-trained and American-equipped Chinese armies still had not been committed in any major action up to the beginning of August. It was expected that they could be used to great advantage in concert with the Chinese-American Composite Wing and the greatly enlarged American air forces, for the Tenth, from India, had just been ordered to China to reinforce the Fourteenth. This involved a command change which resulted in General Chennault's asking to be relieved of duty. If he had remained, he would have been in a subordinate position.

SURRENDER OF THE JAPANESE IN CHINA

These plans were automatically thrown into the discard when the Japanese surrendered. There had been some speculation that their armies in China might defy even an imperial order to lay down their arms, but General Yasuji Okamura sent an envoy to Chihkiang to accept the detailed terms of surrender imposed by Marshal Ho Ying-chin. Some confusion in the disposal of the Japanese resulted from disunity among the Chinese (Kuomintang *vs.* the Yenan or "Communist" elements), but this is properly a matter for consideration in connection with China's internal politics.

The Japanese were already preparing to surrender when the Soviet Union entered the war on Aug. 8, and the vaunted Kwantung Army offered only sporadic, local resistance to the Red armies which overran Manchuria.

CONQUEST OF THE KURILES AND RYUKYUS

With the seizure of the southern Marianas in the summer of 1944, and the neutralization of the northern islands in this chain, Japan's defenses on the ocean side had been reduced to three chains of "stepping-stones" radiating from the home islands: the Kuriles, to the northeast; the Izu-Bonin-Volcano line, to the south, and the Ryukyus, to the southwest. Although some of these positions were 750 miles from the home islands, they constituted part of the "inner fortress" because they could be reached by tactical aircraft flying from home bases, and because their defense had been integrated with that of the four main islands.

Although some Allied commanders, notably Lieut. Gen. Simon B. Buckner, had at one time favored a descent upon Japan by way of the Aleutians and Kuriles, the high command abandoned this project when it became evident that the foul weather conditions, in which fogs and storms were the rule rather than the exception, would make amphibious operations impossible. The U. S. advanced base at Attu was used, therefore, only for reconnaissance flights and nuisance bombing raids against the Kuriles. Even these limited operations were hazardous and costly.

The Ryukyu chain contained several islands with sufficient level ground for airfields from which the strategic bombing of Japan could be conducted, but the capture of such a position had to await the achievement of aerial supremacy over the south China Sea, Luzon Strait and Formosa, which would not be possible until Luzon was secured.

Thus it was the north-south chain, stretching from Tokyo Bay to the Volcano Islands, which was selected for the first Allied penetration into the "inner fortress." None of the islands was large enough for strategic bomber bases, but some contained fighter plane bases which could be enlarged and would be invaluable for two purposes: (1), to facilitate fighter cover for the B-29 Superfortresses which were then suffering heavy operational losses, and (2), to extend Allied fighter range to the beaches of Japan when the time came for invasion. Furthermore, it was important to deny the use of the Bonins and Volcano Islands to the Japanese, as air bases from which they could attack the southern Marianas and the B-29s flying to Tokyo, and as radar outposts from which they could detect the passage of the big bombers and give advance warning to the target areas.

CAPTURE OF IWO JIMA

The individual island selected for capture was Iwo, or Sulphur Island, in the Volcano group. Only five miles long, less than three miles wide, it had two air bases in operation and a third under construction. A campaign of intermittent bombing and bombardment by surface ships had been directed against Iwo since the invasion of the Marianas, but had failed to neutralize it. On the contrary, the Japanese, under an unusually skillful and resourceful commander, Lieut. Gen. Tadamichi Kuribayashi, had spent the last months of 1944 and the first seven weeks of 1945 in strengthening their defenses. American bomber crews noted that during this period the anti-aircraft fire increased in intensity, although the island was subjected to daily raids.

While the main striking force of the U. S. Pacific Fleet, organized as the Fifth Fleet under Admiral R. A. Spruance, steamed into Japanese home waters to isolate the battlefield, a preliminary bombardment force of escort carriers and six old battleships arrived off Iwo on Feb. 16 to "soften it up" for the assault troops. Thousands of tons of bombs and shells were expended on the island's small area. By the 19th, the invasion and support forces assembled off Iwo totaled more than 800 ships, under Vice Admiral Richmond K. Turner.

There was no question that everything possible, short of the use of poison gas against the 20,000 defenders, had been done to facilitate the task of the assault troops, the 4th and 5th Marine Divisions. During the first hour after the landings, it appeared that the preliminary bombardment had accomplished its purpose, for the Japanese offered negligible resistance to the original landings. That appearance, however, was deceptive: as soon as the invaders were "astride the beach," in their most precarious position, the Japanese opened a murderous bombardment with artillery, mortars, and rocket projectiles which took a heavy toll of both men and equipment. Most of the sites from which this fire originated could not be located because they were built into the ground, and this explained why they had not been incapacitated during the pre-invasion bombardment.

The schedule for landing reinforcements was dislocated; the ship-to-shore movement of equipment was thrown into chaos, and at one time there were almost as many wounded men leaving the island as there were replacements arriving. Despite these handicaps, progress the first day was satisfactory, part of Airfield No. 1 being overrun, and the Japanese stronghold built into the cone of Mt. Suribachi, at the southwestern tip of the island, cut off from the rest of the garrison.

Thereafter, progress was much slower. Two regiments of the 3rd Marine Division, which had been held in floating reserve, had to be committed on the third day. No matter how heavy the aerial attacks, the surface ship bombardment, and the counter-battery fire of the Marines, the weight of the Japanese fire was reduced only in the same proportion as more ground was captured. Almost half the island, including much of the second airfield, was captured in seven days; in 11 days more, the advance varied from half a mile to a mile and a half. The island was declared secure after 26 days, but ten days later 200 of the enemy remnant were able to organize underground and deliver a well-planned, costly attack. The process of smoking them out of their burrows continued for weeks.

Iwo was an object lesson in just how expensive the Japanese could make a given piece of ground; they had had 20,000 men on its eight square miles, and not one of them had been quartered above ground. Subterranean works containing arsenals, living quarters, and stores extended hundreds of yards from the mouths of the caves where the guns were sited. No less than 40,000 tons of ammunition had been expended (two tons per man of the enemy), but few Japanese had been killed by it; most had to be dispatched by rifle, machine gun, flamethrower, or demolition charges dropped into their caves. The Marines' casualties, as then reported, were 4,630 killed or missing and 19,938 wounded. The gains which had been obtained at this high cost soon became apparent; great numbers of B-29s, damaged over Japan or in difficulties for other reasons, made emergency landings at Iwo which saved the lives of many crewmen; the B-29s were free from detection or interference en route to the target, and their operations improved greatly in effectiveness.

THE WAR SITUATION IN MARCH

The war situation during March may be recapitulated thus: Iwo had been secured, and would be ready to send fighter plane sweeps against Japan by about April 15; Manila Bay was being opened, so that the building-up of Luzon as a training and staging area for troops to be used in the invasion of Japan could start, even before the whole island was secure; the Twentieth Air Force had withdrawn its 20th Bomber Command from Chengtu, in western China, where its air-supply operations were uneconomic, and was redeploying the B-29s from China in the southern Marianas. The Burma campaign was going well and the Japanese were preparing to withdraw from southern China, but neither of these had much bearing on the strategic situation confronting Japan. With increased air supply and the opening of the Stilwell Road, the U. S. Fourteenth Air Force (China based) was extending its operations to the East and South China Seas, where they meshed with those of air forces based among the Pacific islands—the Twentieth and Seventh in the Marianas, and the Fifth and Thirteenth in the Philippines.

OKINAWA

The United Nations' greatest need at this time was for additional air bases from which the strategic bombing of Japan could be furthered, and for air bases from which fighter sweeps could be launched over Japanese beaches at invasion time. The Marianas and Iwo were too small to accommodate the required numbers of bombers and fighters respectively. The position which would satisfy both requirements was Okinawa, largest island in the Ryukyus, whose main airfields were 365 miles from Kyushu and 950 miles from Tokyo. The seizure of Okinawa would, moreover, complete the isolation of Japan from all its southern conquests by closing the east China Sea, and would make possible an Allied landing on the coast of China whereby some, at least, of the scattered Chinese forces could be equipped and supplied over economical sea routes. Such a landing was in fact planned, as a diversion to precede the invasion of Japan proper.

Okinawa was believed to have a garrison of 50,000 to 70,000 Japanese and was known to have been strongly fortified. Since the population was hostile, the only information about the island had to be obtained by aerial reconnaissance. The distance of Okinawa from the nearest Allied bases—the Marianas, the western Marshalls, and Ulithi in the western Carolines—was so great that the problems of maintenance and supply for both sea and land components of the invading force were vastly complicated. It was therefore decided that the small Kerama Islands, a group lying to the west of southern Okinawa, should be occupied first, to afford a safe roadstead for the great numbers of ships which would be held in the area for long periods, and to supply a base for aerial reconnaissance by seaplanes.

Even before the Keramas were invaded, however, there was elaborate preparation by all the forces which could be brought to bear. Again, the Fifth Fleet entered Japanese home waters, using its carrier planes to isolate the battlefield by attacking enemy naval craft and aircraft at their bases. Although the 20th Bomber Command in China was being dismantled, it furnished weather reports. The 21st Bomber Command operated in strength against the Tokyo area and other industrial sections of Honshu. The Fourteenth Air Force set out to neutralize Canton and Hong Kong, and carried out reconnaissance off the China coast. The Fifth Air Force, flying from Luzon, neutralized Formosa with its 55 airfields. The Seventh Air Force, in the Marianas, struck at all the enemy-held islands within range. A British naval force built around four aircraft carriers (equivalent in strength to an American task group) was assigned to neutralize the Sakishima group of islands, in the Ryukyu chain between Okinawa and Formosa.

On March 26, the Kerama Islands were invaded by elements of the 77th Infantry Division. The small Japanese garrisons were quickly wiped out or else driven into hiding where they could do little harm. An unexpected dividend accruing from this operation was the discovery of large numbers of suicide boats which had been prepared for use against the invasion fleet expected off Okinawa. The great majority were never used.

Suicide planes, however, had been prepared in far greater numbers, and were used much more effectively. In the first 48 hours of the campaign, 18 kamikaze attacked the naval force; 12 were shot down, but six succeeded in crashing into American ships, sinking a minesweeper and damaging two destroyers and a battleship.

The invaders turned their attention to the main target; both coasts of southern Okinawa were struck by carrier planes and raked by battleship gunfire, and transports bearing the 2nd Marine Division made a feint against the southern extremity of the island. In this way, it was hoped, the Japanese could be prevented from guessing where the landings would be made. The stratagem appears to have succeeded to some extent; more important, the Japanese commander, Lieut. Gen. Mitsuru Ushijima, elected not to contest the beaches, but to concentrate his men and his abundant artillery in defense of the mountainous interior of the southern part of the island.

On April 1, the day of the invasion, the only significant enemy action was by kamikaze planes which attacked the fleet almost continuously; the assault troops were ferried to the beaches and walked ashore, upright, without casualties. The Tenth Army, under General Buckner, consisted of the III Marine Amphibious Corps (Major Gen. Roy S. Geiger), on the left flank, and the XXIV (Army) Corps (Major Gen. John R. Hodge), on the right flank. The Marines' mission was to take Yontan airfield and cut across the island to Chimu Bay, then wheel north and capture the northern two-thirds of the island, which was lightly defended. The Army forces were to take Kadena airfield and wheel south, toward Naha, the capital, and Shuri, the former seat of Okinawan kings.

Both airfields were overrun within a few hours, against negligible resistance offered by a handful of Japanese stragglers. The Marines made rapid progress to the north, and reached Cape Hedo by April 13, having encountered serious opposition at only one point, on Motobu Peninsula, where more than 2,000 Japanese dead were counted.

At the end of five days, the Army forces also were about two weeks ahead of schedule, and had overrun one Japanese defense line which proved to be very lightly manned. On April 6, stubborn fighting began on the ground, and the Japanese made their greatest effort in the air. Forty ships already had been sunk or damaged in the campaign, although the Japanese had sent down only small forces of kamikaze. On this day, however, they sent more than 500 down from Kyushu, of which about 400 were shot down en route by fighter planes from Fifth Fleet carriers. Of the 116 which reached the Okinawa area, 55 were shot down by fighters from escort carriers; 61 got through to the fleet, and of these, 39 were shot down by anti-aircraft fire. The remaining 22 were successful in suicide dives against American warships. Two large ammunition ships were blown up, two destroyers and a minesweeper sunk, ten destroyers and three minesweepers damaged. At no time thereafter were the Japanese able to send such large numbers of aircraft against the fleet, but the forces employed were nevertheless considerable. During the three months when the ships were forced to remain in Okinawan waters, the United States Navy's losses in both ships and men were greater than in any other campaign, although no large units were sunk.

The southern land front, where the XXIV Corps was engaged, remained static for two weeks after April 5, the period being devoted to artillery dueling. The Japanese had a greater abundance of artillery, including new large mortars and rockets, than they had had even at Iwo, and it was used with great skill. Nearly all the enemy positions, whether for artillery, automatic weapons, or infantry, were cleverly dug into the hillsides and well concealed.

An exceptionally heavy artillery barrage and an infantry attack along the whole front on April 19 were intended to break the stalemate, but resulted only in the capture of a narrow strip of ground, after which the process had to be repeated. The campaign came to resemble that on Iwo Jima, the Japanese having to be dug, burned, or blasted out of every hole in the ground on the line of advance. On May 1, it was necessary to put the 1st Marine Division, which had completed its mission in the north, into the southern line; later the 6th Marine Division also was added, and in the closing stages of the campaign the 8th Regiment of the 2nd Marine Division was brought back from Saipan. The Army divisions which fought throughout the campaign were the 7th, 27th, 77th, and 96th.

The first break in the enemy's stubborn stand came after May 21, when American infantrymen had at last succeeded in taking commanding hills which would permit turning of the main Naha-Shuri-Yonabaru defense line. Under cover of dirty weather, the Japanese withdrew several miles to a secondary line built into the Yaeju-Dake escarpment, the full-scale assault which began on June 10. Ushijima ignored General Buckner's invitation to "honorable surrender." On June 18, General Buckner was killed while visiting a forward command post to observe the 8th Marines in action. He was temporarily succeeded by General Geiger.

On June 21, organized resistance on Okinawa was declared to have ceased; the campaign which had been expected to last 70 days had actually taken 82 days. No less than 37,658 soldiers and marines had been killed or wounded. However, the number of Japanese was shown to have been seriously underestimated, and the enemy's losses were put at 120,000. In addition to losses ashore, the United States had lost 4,907 naval personnel, and 4,824 had been wounded. Both ashore and aground, Okinawa was the costliest campaign of the Pacific Island war.

SEQUEL TO IWO AND OKINAWA

At the end of the Iwo campaign, and toward the end of that on Okinawa, the number of Japanese willing to surrender increased markedly. Most of the prisoners explained that they were willing to give up when they saw the irresistible superiority of the force which had been brought to bear against them, but in most cases they were at first prevented from doing so by superior officers. By this time, some junior officers were surrendering. It was obvious that with the end of the war in Europe (which came midway in the Okinawa campaign), the Allies would be able to deploy such great forces that Japan was doomed, but the question persisted: would the Japanese surrender before their homeland was completely destroyed, or would they, in order to take the greatest possible toll of Allied lives, fight to the death in the cave-pocked recesses of their own hills and valleys? The frightful cost which they could exact in such a campaign had been demonstrated, on a comparatively small scale, at Iwo and Okinawa.

The consensus among Japanese prisoners whom the writer interviewed at Iwo in April was that the Japanese army and nation would obey a surrender order from the Emperor, but that no such order would be issued until the Allies had landed in Japan.

Although the Allied high command hoped to induce a surrender without the necessity for invasion, it was compelled to plan on the assumption that this might not be possible. For that reason, it began to redeploy the Eighth Air Force from Europe to Okinawa, where 23 airfields were under construction, as well as a number of infantry divisions. The Sixth Army, on Luzon, was put into training for "Operation Olympic," landings on Kyushu to be made toward the end of the year. "Operation Coronet," the invasion of Honshu, was planned for March, 1946.

AERIAL CAMPAIGN AGAINST JAPAN

Meanwhile, Japan itself had begun to feel the weight of Allied air and naval attack. In January, 1945 only one wing (capable of flying off 100 to 150 planes at a time) of B-29s was in operation from the Marianas. In the four following months, four more wings were added, so that by June it was possible to send as many as 800 planes against Japan in a single day. On March 9, using a then-record force of more than 300 planes, the 21st Bomber Command abandoned its doctrine of high-altitude "precision bombing" by daylight, and resorted to night saturation bombing with incendiaries. The result was that about 15 square miles of Tokyo were burned out. Within a week, three other great cities were subjected to the same type of attack: Nagoya (twice), Osaka and Kobe. From then until the end of hostilities, although the richest target areas had already been worked over, the B-29s continued to increase the weight and effectiveness of their assaults.

The United States Fleet had begun to operate in Japanese waters in February, to cover the landing on Iwo. At this time, bad weather protected the ships from enemy aircraft. On March 18, the fleet was back again, to isolate the battlefield of Okinawa. In two days, three carriers were crippled, the *Franklin* suffering exceptionally heavy casualties. Fighter sweeps resulted in the destruction of great numbers of Japanese planes in the air or on the ground, and in considerable damage to enemy fleet units at their bases on the Inland Sea. On April 6, when the fleet was patrolling between Kyushu and Okinawa, its planes intercepted and sank the powerful modern battleship *Yamato,* which was being moved from the Inland Sea to the Yellow Sea, and was forced to avoid the Straits of Shimonoseki because they had been mined.

NAVAL OPERATIONS

Late in May, Admiral William F. Halsey took command of the fleet, relieving Admiral Spruance (the ships were virtually the same, but became known as the Third Fleet), and on July 10 he steamed up to the coast near Tokyo. The Japanese air force was in hiding, and was believed to be dispersed at bases on Hokkaido, so on July 14 the fleet approached that northerly island. Not only were large aircraft groups flown off; at noon, the gunnery ships stood close inshore and shelled the steel town of Kamaishi, on northern Honshu. The next day, Muroran on Hokkaido was bombarded. The Japanese took no counter-measures, either with aircraft or with shore guns, and they had no fleet fit for sea.

On July 17, the British task force joined the American fleet for an assault by 1,500 carrier planes on the Tokyo area, and that night the battleships bombarded a stretch of coast within 40 miles of the capital.

PEACE OVERTURES

The Japanese had already invited Russia to mediate their conflict with the western allies, but Russia had taken no action on the proposal. Instead, meeting with President Truman and Prime Minister Attlee at Potsdam, Premier Stalin had agreed to join in a final assault on Japan if a joint American-British-Chinese declaration calling upon the Japanese to surrender was rejected. This was issued on July 26, and was publicly scorned by the government of Premier Koiso. However, forces were already at work within the Japanese Government to bring about a surrender.

ATOMIC BOMBING OF HIROSHIMA AND NAGASAKI

On Aug. 6, the first atomic bomb in the history of mankind was dropped on Hiroshima. Bomb-damage experts still were unable to agree, months later, as to the military effectiveness of the new and frightful weapon, but the effect upon the Japanese Government was what might have been expected. The faction which was seeking to surrender, if only some face-saving modification of the Potsdam formula of "unconditional surrender" could be found, gained the upper hand. Two days later, a second atomic bomb (of a different type from the first) was dropped on Nagasaki, and the Soviet Union entered the war, beginning a campaign in Manchuria. (See "The Atomic Bomb.").

SURRENDER OF JAPAN

On Aug. 10, the Japanese announced that they would accept the Potsdam proposal, provided that "the prerogatives of the Emperor as sovereign ruler" were maintained. On the 14th, after a further exchange of notes, President Truman announced that the Japanese reply was construed as acceptance of the Allied demand.

General MacArthur was appointed supreme commander for the Allied powers to accept the surrender, and after a Japanese delegation had flown to Manila to receive his instructions, the first American occupation units landed without incident at Atsugi airfield on Aug. 26. On Sept. 2, additional forces having been landed from ships at key points around Yokosuka, the formal surrender was signed aboard the battleship *Missouri* in Tokyo Bay.

Although there were some irritating delays, especially in southeast Asia, and in certain areas considerable time elapsed before the commanders of isolated Japanese units received satisfactory proof of the Emperor's order to lay down their arms, it was, in the end, universally obeyed. Japanese armies everywhere, including more than 2,000,000 men in the home islands, submitted peaceably to disarmament. It was found that the bypassed garrisons, such as that at Rabaul in New Britain, had been even stronger than estimated. There was no precedent in history for the surrender of so great a military force, only small segments of which had been engaged and defeated, but after they had submitted themselves to disarming, and, in the case of overseas garrisons, to repatriation, Japanese warriors, like the rest of Japan, ceased to be a military problem and became exclusively a political problem. (See "The Military Occupation of Japan.")

THE ATOMIC BOMB

By George M. Murphy

Associate Professor of Chemistry, Yale University

USE IN THE WAR

The most important single event of the war was revealed to the world by President Truman at 10:45 A.M. on Aug. 6, 1945. He said, in part: "Sixteen hours ago an American airplane dropped one bomb on Hiroshima, an important Japanese Army base. That bomb had more power than 20,000 tons of TNT. It had more than two thousand times the blast power of the largest bomb ever yet used in the history of warfare." Naming this new weapon of war an atomic bomb, he warned that if the Japanese did not accept our terms, "they may expect a rain of ruin from the air, the like of which has never been seen on this earth."

Three days later, on Aug. 9, another atomic bomb was exploded over the city of Nagasaki. The next day, the Japanese Government sued for peace, and, on Aug. 14, the war was over. It seems clear that the new weapon did not win the war, for that was accomplished by the men actually engaged in combat with the enemy, but the atomic bomb did shorten the war, thus saving the lives of thousands who would otherwise have continued the fight. What may be much more important is the effect of the successful utilization of atomic energy on the future history of civilization.

Complete details of the destruction in these two Japanese cities will probably never be known. Accounts of eye witnesses, aerial surveys, and inspection by American observers after the fall of Japan all agree as to the magnitude of the ruin. The pre-war population of Hiroshima was known to be about 340,000. Casualties were believed to be about half this number; deaths were estimated as approximately 50,000, many of these dying later from burns or other wounds receiver at the time of the original blast; a relatively small number died from the effects of radioactivity. There were said to be no buildings in the city undamaged, and four square miles, about 60 per cent of the city's area, were completely devastated.

The area of the blast damage at Nagasaki was smaller than that at Hiroshima but destruction was more complete, most buildings apparently being reduced to powder. Of this city's four square mile area, about one-third, was in total ruins. Observers reported that the destruction was much greater than in Stalingrad or Warsaw. Casualties in Nagasaki, whose population was about 250,000, were comparable in number with those at Hiroshima.

SCIENTIFIC BASIS FOR THE BOMB

The scientifically minded reader is probably aware that the War Department has issued an official report on the atomic bomb project, *Atomic Energy for Military Purposes* by H. D. Smyth (Princeton Univ. Press, 1945) and to this source reference may be made for technical details which can not be given here. The following account is based mostly on that report.

During the last 25 years, the physicist has studied a large number of nuclear disintegration reactions. As a typical example, a nuclear particle, such as the neutron, is hurled at an atom which, as a result of this bombardment, is converted into an atom of a different chemical element. An important new feature, known as fission, was observed by the German investigators, O. Hahn and F. Strassmann in 1939, and explained by O. R. Frisch and Lise Meitner. In their experiments, they showed that bombardment of the uranium atom with neutrons causes the nucleus to split into two fragments of nearly equal mass. These residues are highly radioactive, emitting neutrons and other particles in an attempt to reach a final stable state. The possibility thus exists of starting what is known as a chain reaction. A single neutron from an external source would be used to split the first uranium atom in the primary act. At least one additional neutron is to be expected from the decay of the fission products, and this neutron will cause fission of a second uranium nucleus. The process will then proceed spontaneously, after the single original neutron has been supplied, and will cease only when all of the uranium present has been transformed into fission products or when the chain is broken by loss of neutrons owing to extraneous reactions or other reasons.

It was easy to show that a considerable loss of mass occurs in the fission reaction, and according to a principle discovered by Einstein in 1905, it could be calculated that the energy released per fission is 200,000,000 electron-volts. This figure is fantastically large compared with somewhat less than one electron-volt observed in explosions of dynamite, burning of coal, and all other energy producing reactions previously known.

By June 1940, the scientific status of the fission problem was reasonably clear to the nuclear physicist. It seemed probable that a nuclear chain reaction could be made to occur and that the energy concurrently released could be used either to produce a military weapon of unbelievable potentiality or to furnish an almost inexhaustible supply of power for peaceful uses. Theoretical indications suggested that control of such reactions was possible so that the power plant would not blow up and the bomb would not explode until it was ready to fall on the enemy target. The practical difficulties did not appear insurmountable. The most difficult ones should be mentioned.

It was known that the element uranium, as it occurs in Nature, is composed of atoms of three different varieties known as isotopes. The masses of these isotopes, on the usual scale of atomic weights, are approximately 234, 235, and 238. It was also known that only neutrons traveling with relatively slow speeds, so-called thermal neutrons, produced fission and that the isotope U-235 was the atomic species directly involved in the fission act. The heavier isotope, U-238, was expected to capture the thermal neutrons and thus reduce the number of neutrons available for carrying on the chain reaction desired. (The presence of U-234 is of little consequence since it composes only about 0.006 per cent of the naturally occurring mixture of isotopes.) It thus became apparent that the success of the project depended on the separation of U-235 and U-238.

This task, while simple in principle, was actually extremely difficult, for isotopes differ from each other only in physical properties and chemically hardly at all. This means that the usual chemical separation methods are quite useless and that lesser known physical methods must be employed. While some separation of other isotopes had been previously achieved, one is forced, in the present case to work with the most difficult case in Nature, as uranium is the heaviest known element and all separation efficiencies will here be at a minimum. Finally, the relative abundance of U-235 is only 0.71 per cent, therefore any separation process must be arranged to handle large amounts of material in order to get relatively small amounts of U-235 desired.

ORGANIZATION OF THE PROJECT

Almost immediately after the discovery of fission, some nuclear physicists in this country became alarmed over the potentiality of the phenomenon as a military weapon. These fears were further increased by rumors in scientific circles and later by more definite information that the German Government was devoting considerable effort to exploration of its military uses.

The organizational history of the project is complex, many changes having occurred during the period of its existence. A complete account of it may be found in the Smyth report (*loc. cit.*). Suffice it here to say that the growing fears of the scientists led them to present the situation to President Roosevelt in the fall of 1939 and that he, being convinced of its urgency, made funds available for further research. Progress was slow but the activities were continually expanded, first under the National Defense Research Council, then under the Office of Scientific Research and Development, and finally under a new district formed in the Corps of Engineers of the U. S. Army.

This district, formally established on Aug. 13, 1942 and called the Manhattan District was, in September of that year, placed under the charge of Major Gen. (then Brigadier Gen.) Leslie R. Groves. The work of the district has continued essentially unchanged to the present date.

Simultaneously with the American project, research and development also occurred in both England and Canada. Both governments issued official reports, similar to that of Smyth.

During the period covered between 1939 and 1945, there were many false starts, unsuccessful experiments, and abandoned methods. The objective was clear: large quantities of separated U-235 or other fissionable materials were to be prepared and this material was to be placed in bombs so devised that the atomic explosion would occur. Two different separation methods were eventually operated on a large scale and a new fissionable element, plutonium was also produced. The means of achieving these results will now be described.

SEPARATION BY DIFFUSION

The diffusion method was first suggested by J. R. Dunning, following preliminary experiments made by E. T. Booth, A. V. Grosse, and himself at Columbia University in 1940. Research continued there, and, in May 1943, H. C. Urey was placed in charge, the laboratories, with Columbia University as the contracting party, by now being called, for security reasons, the SAM. Laboratories. In the meanwhile, design and construction of a large-scale diffusion plant had been entrusted to the Kellex Corporation, with P. C. Keith as executive in charge. This plant, located at Oak Ridge, Tenn., was operated by the Carbide and Carbon Chemicals Corporation, with G. T. Felbeck in charge. Responsibility for the SAM. Laboratories was also assumed by that corporation on Feb. 1, 1945, with R. H. Crist as Director of the research. Additional research and development of the diffusion process occurred at other laboratories, including Princeton University under H. S. Taylor and at the Bell Telephone Laboratories.

The diffusion method required that large quantities of a gaseous uranium compound be circulated in apparatus equipped with semi-porous membranes through which the gas could diffuse. The lighter molecules, containing U-235 enriched material, will concentrate in the diffusate and can be recirculated, if necessary, in order to achieve increased purity of product. Unfortunately, the only suitable compound was highly corrosive, and this meant that special requirements and treatments were imposed on blowers, pumps, seals, diffusion membranes, and all other materials used in the plant.

The amount of separation secured in a single unit was very small so it was necessary to connect many thousands of such units in successive stages. Another problem encountered was that of making the plant vacuum tight so that the valuable product would not leak out of the equipment and so that air would not leak into it to contaminate the product. Eventually, all of these problems were satisfactorily solved, and the diffusion plant at Oak Ridge was in operation before the summer of 1945. Its performance has been consistent, reliable, and, in general, better than had been anticipated.

ELECTROMAGNETIC SEPARATION

The first actual separation of U-235 was made in March 1940 by Nier, Booth, Dunning, and Grosse, using a mass spectrometer to prepare minute amounts of enriched material. This method was therefore pursued further with the object of obtaining greater amounts of U-235 by a method already shown to be effective. The initial experiments were done by E. O. Lawrence at the University of California and by H. D. Smyth at Princeton University. The particular device developed at the former location proved to be most suitable, and work on the method was eventually concentrated there. The separator, called the calutron, consists of an ion source from which a beam of uranium ions is drawn by an electric field, accelerated to high velocities, separated in a magnetic field and collected in a system to receive the enriched material. As in the diffusion method, many technical and engineering problems were encountered. The advantages of this method included the high separation efficiency of the unit machine and the independent operation of each unit. The latter made it possible to modify and improve the process as the large scale plant was in course of construction.

Construction of the electromagnetic plant was started at Oak Ridge, Tenn., in March 1943, by the Stone and Webster Engineering Company. The first units were put into operation in November 1943. Research and development were mostly at the University of California under the direction of E. O. Lawrence; the equipment was manufactured by Westinghouse, General Electric, and Allis-Chalmers; the plant was operated by the Tennessee Eastman Company.

PRODUCTION OF PLUTONIUM

When the more abundant isotope, U-238, is irradiated with neutrons some of them are captured to form a new isotope, U-239, not existent in nature. This isotope is unstable, decaying to form a new element, called neptunium, and this, in turn, decays to form plutonium. The latter element is also radioactive but its stability is relatively great, its life-time being greater than that of radium. It was shown to be of value comparable to U-235 for chain reaction in bomb purposes. Moreover, its chemical properties will not be identical with those of uranium hence, unlike the separation of U-235 from U-238, separation of uranium and plutonium will be possible by chemical means, a process more practicable in principle than isotopic separation.

Following some preliminary experiments at the University of California, an organization was established at the University of Chicago, in January 1942, under the direction of A. H. Compton. It was called the Metallurgical Laboratory and its purpose was that of making a further study of the whole plutonium problem.

Earlier experiments at Columbia University had been made with an arrangement called a pile, composed of a lattice structure of graphite and uranium oxide. Neutrons formed by fission in the oxide were to be reduced to thermal velocities by the graphite, this material being called the moderator. The primary purpose of the pile was that of inquiry into the question of most importance for the entire project: will enough neutrons be produced in such a system to sustain the chain reaction? If the answer to this question had been negative, the whole project was doomed to failure. The Columbia results, while not conclusive, were encouraging, and the Chicago group set out to study this problem on a larger scale. They also proposed to apply the pile to the production of plutonium, if this proved practicable.

By the fall of 1942, they had assembled about six tons of uranium metal, uranium oxide, and graphite. They believed that, when this structure reached a certain critical size, neutrons from spontaneous fission or other sources would start the reaction going. This, indeed, proved to be the case, and, on Dec. 2, 1942, the first Chicago pile was so operated at a power level of ½ watt. Ten days later, the power was increased to 200 watts.

The importance of this experiment can not be minimized, for, in addition to its value for the bomb project, here was demonstrated for the first time that nuclear energy could be used for the production of power. The difference between this power plant and the conventional type, using coal or other fuel, should be noted. The latter will require periodic addition of fuel throughout its existence; the former, once erected to the critical size, needs no further attention and will furnish power continuously for a very long time. Control of the power level is simply achieved by the position of certain control rods which are placed so that the number of neutrons available can be regulated.

It could be shown that the amounts of plutonium required for a single bomb would necessitate the operation of this small pile for many thousand years and that piles of 500,000 to 1,500,000 kilowatts capacity were needed. For comparison, we observe that the ultimate capacity of the hydroelectric plants at the Grand Coulee Dam is expected to be 2,000,000 kilowatts.

The Chicago group set out to build such a plant. Design, construction, and operation were delegated to the du Pont Company, and construction was started at a site on the Columbia River at Hanford, Wash., in June 1943. In addition to the plant itself, chemical separation processes were built for the extraction of the plutonium product. The first pile was operated in September 1944; three piles were in operation by the summer of 1945. Chemical separation and production of plutonium were better than had been anticipated.

The chemical research and other problems involved in the plant were the responsibility of the Metallurgical Laboratory, and, to enable such experiments to be done, the Chicago pile was rebuilt at a site outside of the city, named the Argonne Laboratory. A larger experimental pile was also constructed at Oak Ridge. Designed for 1,000 kilowatts, it was first operated in November 1943. Subsequent improvements permitted its temperature to be raised so that the power level was increased to more than 1,800 kilowatts.

DEVELOPMENT OF THE BOMB

Theoretical and experimental problems connected with the bomb itself were initiated at Chicago in the summer of 1942 under the direction of J. R. Oppenheimer. It was finally decided, for reasons of secrecy, to move this research to a new laboratory erected at Los Alamos, N. M., about 30 miles from Santa Fé. This laboratory, established in the spring of 1943, was equipped with apparatus which made it the finest physics research laboratory in the world. The scientific staff assembled there included the most competent workers available. It was the highest concentration of scientific genius ever to work together in a single place.

Researches at the other installations described in this account had occurred under the tacit assumption that explosions would not take place and with precautions to prevent this, where necessary. The primary purpose of the Los Alamos laboratory was that of finding means of making the chain reaction explode. The success of these endeavors was demonstrated unquestionably on July 16, 1945 in a remote section of the Alamogordo Air Base, 120 miles southeast of Albuquerque, before a group of scientists and military officials.

With utmost despatch, preparations were made to repeat the demonstration in a more public fashion. Assembly of materials and transportation to the Pacific Area required two weeks; unfavorable weather caused further delay; the world learned the results on Aug. 5, 1945.

THE MANHATTAN DISTRICT

This account would be incomplete without further reference to the important part played by the Manhattan District. Such a military organization was well suited to tackle the enormous procurement of personnel and materiel required. Much of the technical manpower of the country was already established in other war work and great powers of persuasion or other means were needed to arrange for transfer to the bomb project. A large number of enlisted men with special qualifications were also supplied to many of the installations.

Huge quantities of materiel were required, not only for construction, but also highly technical chemicals and equipment. Sources of such materiel had to be developed, manufacturing processes devised, and manufacturers discovered who could or would do the processing. The construction of such huge plants as those at Oak Ridge and Hanford involved machinery and techniques never before utilized. Finally, it will be remembered that both of these towns, as well as the Los Alamos site, were built by the District and thousands of workers had to be accommodated at each place. Housing, transportation, stores, schools, hospitals, amusements, and all the other appurtenances of living had to be supplied to locations formerly devoted to farms, forests, or wastelands.

The Manhattan District also had charge of the important problems of security and secrecy. The high degree of success in protecting the secret shows how well this difficult task was completed.

THE FUTURE OF THE BOMB

It has been said that, although it was an extremely difficult job to develop the bomb, it will be even more difficult to know what to do with it in a world at peace. After the initial awe and wonder arising from the use of the bomb began to wear away, it became evident that legislation was necessary for domestic control and that international agreements relative to its future use were imperative. The first definite steps were taken by the introduction of legislation, known as the May-Johnson bill, into the U. S. Congress. This bill provided for a commission with almost dictatorial authority over every phase of the subject.

The scientists of the country, particularly those who had worked on the bomb, objected to this legislation because they believed that further scientific progress could occur only under complete freedom; that the Commission, as proposed in the bill, would not be subject to jurisdiction by the courts or other authority; and that the bill's passage would convince the world that the United States was opening an armaments race. They further believed that international agreements were of paramount importance if civilization were to survive, and they set out to bring all of these arguments before the people and the Congress.

In order to do this, each of the laboratories formed associations of workers and these were finally merged into a national Federation of Atomic Bomb Scientists with headquarters in Washington. It is apparent that their labors, as well as those of many other groups with similar aims, were partly responsible for the fact that the May-Johnson bill now appears to be permanently tabled.

Subsequently, a special Senate Committee on Atomic Energy was created with Senator Brien McMahon (Conn.) as chairman. Its members are Senators Vandenberg, Tydings, Connally, Hart, Johnson, Hickenlooper, Russell, Byrd, Millikin, and Austin. Competent technical advisers are attached to the committee. Public hearings began on Nov. 27, 1945 and will apparently continue for some time to come. It is the announced intention of the committee, to learn from scientists, military personnel, and others all of the pertinent facts before legislation is prepared.

Previous to these actions, in a message to Congress on Oct. 3, 1945, President Truman had warned that atomic force in ignorant or evil hands could inflict untold disaster on the nation and the world. He urged the prompt creation of means for controlling future research and development. He felt that international phases of the problem could not wait until the United Nations Organization was functioning and said that he would initiate discussions with Great Britain and other nations so that cooperation, rather than rivalry, would exist in the field of atomic power. The first such conference was held in Washington where President Truman met with Prime Ministers Attlee of Great Britain and W. L. Mackenzie King of Canada.

The three-nation declaration arising from the meetings, dated Nov. 15, 1945, concluded that: (1) the secret and production of atomic bombs can not remain the monopoly of any single nation; (2) there is no effective way to stop the use of such weapons by an aggressor nation; (3) the only protection against it and other weapons of war is the prevention of war itself. It recommended whole hearted support of the UNO in its attempts to create conditions of mutual trust and devotion to the arts of peace, the rules for achieving these objectives to be worked out by that organization. It further suggested the formation of a commission to explore the possibilities of outlawing the atomic bomb, to formulate methods of inspection and control of unauthorized manufacture of fissionable materials, and to promote exchange of scientific information so that atomic energy may be used for peace-time purposes.

On Dec. 17, 1945, a second meeting

on world problems, including those concerned with the bomb, began in Moscow. It was attended by Secretary of State James F. Byrnes, Foreign Secretary Ernest Bevin of Great Britain, and Foreign Commissar V. M. Molotoff of Russia. The three nations agreed to ask the General Assembly of the UNO to turn over to the 11 nations on the Security Council of that organization, with the addition of Canada, the problem of study and recommendation for: (1) exchange of basic scientific information for peaceful aims; (2) control of atomic energy for the same purposes; (3) elimination of this weapon from the arsenals of nations; (4) means of protecting these nations from violations and evasions of international atomic energy agreements.

THE FUTURE OF ATOMIC POWER

The more lurid and sensational of the prophets of the atomic age proclaimed Aug. 5, 1945 as the dawn of a new era. Power would be at an incredibly cheap price and in amounts vastly exceeding man's demands; automobiles and other vehicles would be driven countless numbers of miles by the power from pellets of atomic materiels inserted into these machines.

The prophets of gloom, on the other hand, and with equivalent misinformation, predicted that utilization of atomic power would not occur for 100 years or more. The truth, of course, was between these extremes but apparently closer to the vision of the optimist. The pellet-driven machines will not be immediately attainable for a very simple reason: the high levels of radioactive products accompanying fissionable materiels will be extremely dangerous to the driver. Approximately 50 tons of shielding are required for adequate protection.

In confined spaces, such as in a submarine or in a ship, where this shielding burden would be of no consequence, there are more immediate opportunities for the use of atomic power. An isolated region, where transportation difficulties might hinder the introduction of more conventional fuels, may also be considered as a suitable location for an atomic power plant, provided the advantages so gained could make the installation economically feasible. For such specialized power purposes, it seems probable that 10-20 years is not an unlikely period.

For purposes other than power, the explosive properties of a carefully controlled bomb might be exploited for opening a mineral deposit in an inaccessible region, or for other special uses. More visionary applications, such as uncovering polar regions by melting ice caps or destruction of hurricanes with an atomic bomb, can be shown to be impracticable or unlikely.

Most scientists are agreed that such applications are trivial in comparison with what might be gained by use of the newly achieved atomic knowledge in scientific research. A single pile, for example, is equivalent to more radium than has ever been mined in the history of the world. Its use for medical research, possible healing and the knowledge of disease so secured might be worth the $2,000,000,000 that the bombs cost. More specific predictions would be rash, in view of the unexpected discoveries made in pure and applied science during the last 50 years. The pages of THE AMERICAN YEAR BOOK will record them in the years to come, provided nations can agree to live together in peace and forego the annihilation of civilization that will inevitably result if atomic bombs are used in another war.

THE MILITARY OCCUPATION OF JAPAN

By William M. Schuyler
Editor, *The American Year Book*

GENERAL

In the whole course of its history, the United States has undertaken no more dramatic venture abroad than the current military occupation of Japan, nor one involving like responsibilities and potentialities. Only the events of the last four months of the year 1945 come within the scope of this review. They represent little more than the beginning of what may well prove to be one of the world's great social and political revolutions.

The final collapse of Japan, precipitated by the atomic bombing of Hiroshima and Nagasaki, immediately posed the problem of the administrative control of the defeated empire. As the most directly challenged of the United Nations belligerents, following the 1941 Pearl Harbor attack, it fell to the lot of the United States to assume the chief burden. As the supreme commander of the military forces in the Pacific theater of the war, it fell to the lot of Gen. Douglas MacArthur to administer the machinery of control. Having established his headquarters in the United States Embassy at Tokyo on Sept. 8, General MacArthur proceeded in the performance of his new duties with characteristic tact, firmness, and promptitude. The next day he announced in effect that the Japanese would be permitted to govern themselves as long as they and the Emperor obeyed orders issued by the Allied command.

THE MOSCOW AGREEMENTS ON JAPAN

At the December meeting of the foreign ministers of the United States, Great Britain, and Russia in Moscow, an accord on Japan was reached which considerably modified the original American view that other nations should be restricted to an advisory role in the administration of Japan. Russia had desired to establish a four-power control régime in Tokyo, and Great Britain had desired to have more than merely the power to advise. The accord reached at Moscow provided that American control be merged into an 11-nation organization in which the United States, the Soviet, Great Britain, and China would each have a veto power over the formulation of new policies or the modification of those already in existence. The United States, however, would have the most important single voice among the Big Four, and General MacArthur would retain significant powers. The new control arrangements, it appeared, did not meet with General MacArthur's approval but he did not specify his reasons for disapproving and made it clear that he would try to make them work. Nor was the reaction in Congressional and American press circles entirely favorable. Regarding the plan itself, the Foreign Policy Association commented in its *Bulletin:*

"Unquestionably the plan drawn up by the Big Three, with the concurrence of China, is a complicated scheme, containing many possibilities of friction and requiring the highest degree of tact and good will on the part of the powers and their representatives. But international cooperation is always a more complex matter than action by a single state, and the arrangements for Japan could hardly be simple in view of the divergent attitudes that had to be reconciled within a single formula. The most important fact is that the three foreign ministers were able to agree on a cooperative policy, an objective which properly overrides other considerations. With regard to General MacArthur, the Moscow accord is in no sense a reflection on his services; but, like all American occupation officials—and this was true of General Eisenhower in Germany—he is necessarily subject to a higher political authority."

UNITED STATES GOVERNMENT STATEMENT OF POLICY RELATING TO JAPAN

It is pertinent, nevertheless, to record the United States Government's statement of general initial policy which was prepared jointly by the State, War, and Navy Departments and approved by the President on Sept. 6. The statement was sent to General MacArthur by messenger at once, and was issued to the public on Sept. 22. "This document," it states in the introductory paragraph, "is a statement of general initial policy relating to Japan after surrender. It has been approved by the President and distributed to the Supreme Commander for the Allied Powers and to appropriate United States departments and agencies for their guidance. It does not deal with all matters relating to the occupation of Japan requiring policy determinations. Such matters as are not included or are not fully covered herein have been or will be dealt with separately." The full text of the document is appended to this review.

THE POSITION OF THE EMPEROR

The only condition attached to Japan's surrender to the Allied Powers was that the Emperor's position as sovereign should be recognized. In view of what has happened since, it would appear that the decision of the Allies to accept this condition, without, however, any commitments as to the future form of government, was wise. It meant merely that Allied orders were relayed through the Emperor who could act only in conformity with the Supreme Command's directives. No initiative on the part of the Emperor, the Cabinet, or the Diet was permitted without the scrutiny and approval of the occupying authority. On Sept. 10, the Imperial General Staff was ordered dissolved, and within a week thereafter the following orders were issued: publication of a list of 40 Japanese wanted as war criminals; dissolution of the jingoistic Black Dragon Society and the arrest of its leaders; establishment of American censorship over the Domei news agency; report on all Japanese war loot; inauguration of a re-education plan, emphasizing democracy; and the temporary suspension of the *Asahi* newspaper because of "inflammatory" articles.

On Oct. 4, General MacArthur ordered the restoration of all civil liberties, the freeing of political prisoners, and the abolition of the secret police. These orders sufficiently indicate the trend of the Allied objectives, and they were a test of the will of the Emperor and Government to cooperate. The Emperor had already broken all precedent by making a personal call on General MacArthur at his headquarters (Sept. 27). An innovation, still more startling to the Japanese people, was made by Hirohito when, in a New Year message to the empire, he disclaimed all idea of his own divinity—defined by the Japanese constitution and law—as a matter of "legends and myths." In this rescript, the Emperor reaffirmed the charter granted by the Emperor Meiji in 1868 with its pledge of free assembly and government in accordance with public opinion, and its promise to discard old usages and to give "justice and equity" to "all common people" as well as to the governing class. It asked the people for unity and work and the resolve to seek civilization in peace. On this hopeful note, the occupation of Japan ended the year 1945.

ABOLITION OF SHINTO AS THE NATIONAL RELIGION

Before this took place, however, General MacArthur handed to the Japanese Government (Dec. 15) the long expected order ending all state support of the nationalistic Shinto religion of the country. The significance of this order (a document of 2,000 words) lay in its purpose to end the glorification of warrior ancestors which had been the basis of the cult of military aggression and of the Japanese conception of themselves as a superior race destined to conquer the world. Under the mantle of this cult, Japanese warmongers had safely operated. General MacArthur's order specifically abolished the Home Ministry's Shrine Board and the religious order directing the Grand Shrine of Ise, the largest in Japan; also, all public institutions training Shinto priests, all teaching of Shinto in government-supported schools, all "physical symbols of State Shinto" in public buildings, and the purging by censorship of all textbooks and teachers' manuals of Shinto doctrine and forbidding the publication of new books containing like material. In fact, the order ended the connection between Church and State but did not interfere with church property or private religious instruction.

LAND REFORM

On Dec. 18, the eighty-ninth session of the Japanese Imperial Diet ended with the passage of a land reform bill as well as a labor union bill. Both measures became law upon Cabinet announcement. The land reform measure resulted from the Supreme Command's order that the feudal system of land tenure should be abolished. That system was one of the main pillars of the militaristic system. Specifically it required the elimination of absentee ownership, provision for government credit for tenant purchases of land, stabilization of farm prices, and protection of former tenants against the possibility of their again becoming sharecroppers. By this measure, the peasant would be freed, in the words of General MacArthur's order, "from the bondage of the feudal absentee landowner, the mountain of debt, discriminatory taxation, and other economic ills that have oppressed him for centuries."

TEXT OF THE U. S. STATEMENT OF POLICY ON JAPAN

PART I—ULTIMATE OBJECTIVES

The ultimate objectives of the United States in regard to Japan, to which policies in the initial period must conform, are:

(a) To insure that Japan will not again become a menace to the United States or to the peace and security of the world.

(b) To bring about the eventual establishment of a peaceful and responsible Government which will respect the rights of other states and will support the objectives of the United States as reflected in the ideals and principles of the Charter of the United Nations. The United States desires that this Government should conform as closely as may be to principles of democratic self-government but it is not the responsibility of the Allied Powers to impose upon Japan any form of government not supported by the freely expressed will of the people.

These objectives will be achieved by the following principal means:

(a) Japan's sovereignty will be limited to the islands of Honshu, Hokkaido, Kyushu, Shikoku and such minor outlying islands as may be determined, in accordance with the Cairo Declaration and other agreements to which the United States is or may be a party.

(b) Japan will be completely disarmed and demilitarized. The authority of the militarists and the influence of militarism will be totally eliminated from her political, economic and social life. Institutions expressive of the spirit of militarism and aggression will be vigorously suppressed.

(c) The Japanese people shall be encouraged to develop a desire for individual liberties and respect for fundamental human rights, particularly the freedoms of religion, assembly, speech, and the press. They shall also be encouraged to form democratic and representative organizations.

(d) The Japanese people shall be afforded opportunity to develop for themselves an economy which will permit the peacetime requirements of the population to be met.

PART II—ALLIED AUTHORITY

1. Military Occupation.

There will be a military occupation of the Japanese home islands to carry into effect the surrender terms and further the achievement of the ultimate objectives stated above. The occupation shall have the character of an operation in behalf of the principal Allied Powers acting in the interests of the United Nations at war with Japan. For that reason, participation of the forces of other nations that have taken a leading part in the war against Japan will be welcomed and expected. The occupation forces will be under the command of a supreme commander designated by the United States.

Although every effort will be made, by consultation and by constitution of appropriate advisory bodies, to establish policies for the conduct of the occupation and the control of Japan which will satisfy the principal Allied Powers, in the event of any differences of opinion among them, the policies of the United States will govern.

2. Relationship to Japanese Government.

The authority of the Emperor and the Japanese Government will be subject to the Supreme Commander, who will possess all powers necessary to effectuate the surrender terms and to carry out the policies established for the conduct of the occupation and the control of Japan.

In view of the present character of Japanese society and the desire of the United States to attain its objectives with a minimum commitment of its forces and resources, the Supreme Commander will exercise his authority through Japanese governmental machinery and agencies, including the Emperor, to the extent that this satisfactorily furthers United States objectives. The Japanese Government will be permitted, under his instructions, to exercise the normal powers of government in matters of domestic administration.

This policy, however, will be subject to the right and duty of the Supreme Commander to require changes in governmental machinery or personnel or to act directly if the Emperor or other Japanese authority does not satisfactorily meet the requirements of the Supreme Commander in effectuating the surrender terms. This policy, moreover, does not commit the Supreme Commander to support the Emperor or any other Japanese governmental authority in opposition to evolutionary changes looking toward the attainment of United States objectives. The policy is to use the existing form of government in Japan, not to support it.

Changes in the form of government initiated by the Japanese people or Government in the direction of modifying its feudal and authoritarian tendencies are to be permitted and favored. In the event that the effectuation of such changes involves the use of force by the Japanese people or Government against persons opposed thereto, the Supreme Commander should intervene only where necessary to insure the security of his forces and the attainment of all other objectives of the occupation.

3. Publicity as to Policies

The Japanese people, and the world at large, shall be kept fully informed of the objectives and policies of the occupation, and of progress made in their fulfillment.

PART III—POLITICAL

1. Disarmament and Demilitarization.

Disarmament and demilitarization are the primary tasks of the military occupation and shall be carried out promptly and with determination. Every effort shall be made to bring home to the Japanese people the part played by the military and naval leaders, and those who collaborated with them, in bringing about the existing and future distress of the people.

Japan is not to have an army, navy, air force, secret police organization, or any civil aviation. Japan's ground, air and naval forces shall be disarmed and disbanded and the Japanese Imperial General Headquarters, the General Staff and all secret police organizations shall be dissolved. Military and naval matériel, military, naval and civilian aircraft shall be surrendered and shall be disposed of as required by the Supreme Commander.

High officials of the Japanese Imperial General Headquarters, and

General Staff, other high military and naval officials of the Japanese Government, leaders of ultra-nationalist and militarist organizations and other important exponents of militarism and aggression will be taken into custody and held for future disposition. Persons who have been active exponents of militarism and militant nationalism will be removed and excluded from public office and from any other position of public or substantial private responsibility. Ultra-nationalistic or militaristic social, political, professional and commercial societies and institutions will be dissolved and prohibited.

Militarism and ultra-nationalism, in doctrine and practice, including para-military training, shall be eliminated from the educational system. Former career military and naval officers, both commissioned and non-commissioned, and all other exponents of militarism and ultra-nationalism shall be excluded from supervisory and teaching positions.

Laws, decrees and regulations which establish discriminations on grounds of race, nationality, creed or political opinion shall be abrogated; those which conflict with the objectives and policies outlined in this document shall be repealed, suspended or amended as required; and agencies charged specifically with their enforcement shall be abolished or appropriately modified. Persons unjustly confined by Japanese authority on political grounds shall be released. The judicial, legal and police systems shall be reformed as soon as practicable to conform to the policies set forth in Articles 1 and 3 of this Part III and thereafter shall be progressively influenced, to protect individual liberties and civil rights.

2. War Criminals.

Persons charged by the Supreme Commander or appropriate United Nations agencies with being war criminals, including those charged with having visited cruelties upon United Nations prisoners or other nationals, shall be arrested, tried and, if convicted, punished. Those wanted by another of the United Nations for offenses against its nationals shall, if not wanted for trial or as witnesses or otherwise by the Supreme Commander, be turned over to the custody of such other nation.

3. Encouragement of Desire for Individual Liberties and Democratic Processes.

Freedom of religious worship shall be proclaimed promptly on occupation. At the same time it should be made plain to the Japanese that ultra-nationalistic and militaristic organizations and movements will not be permitted to hide behind the cloak of religion.

The Japanese people shall be afforded opportunity and encouraged to become familiar with the history, institutions, culture and the accomplishments of the United States and the other democracies. Association of personnel of the occupation forces with the Japanese population should be controlled, only to the extent necessary, to further the policies and objectives of the occupation.

Democratic political parties, with rights of assembly and public discussion, shall be encouraged, subject to the necessity for maintaining the security of the occupying forces.

PART IV—ECONOMIC

1. Economic Demilitarization.

The existing economic basis of Japanese military strength must be destroyed and not be permitted to revive.

Therefore, a program will be enforced containing the following elements, among others; the immediate cessation and future prohibition of production of all goods designed for the equipment, maintenance, or use of any military force or establishment; the imposition of a ban upon any specialized facilities for the production or repair of implements of war, including naval vessels and all forms of aircraft; the institution of a system of inspection and control over selected elements in Japanese economic activity to prevent concealed or disguised military preparation; the elimination in Japan of those selected industries or branches of production whose chief value to Japan is in preparing for war; the prohibition of specialized research and instruction directed to the development of war-making power; and the limitation of the size and character of Japan's heavy industries to its future peaceful requirements, and restriction of Japanese merchant shipping to the extent required to accomplish the objectives of demilitarization.

The eventual disposition of those existing production facilities within Japan which are to be eliminated in accord with this program, as between conversion to other uses, transfer abroad, and scrapping will be determined after inventory. Pending decision, facilities readily convertible for civilian production should not be destroyed, except in emergency situations.

2. Promotion of Democratic Forces.

Encouragement shall be given and favor shown to the development of organizations in labor, industry and agriculture, organized on a democratic basis. Policies shall be favored which permit a wide distribution of income and of the ownership of the means of production and trade.

Those forms of economic activity, organization and leadership shall be favored that are deemed likely to strengthen the peaceful disposition of the Japanese people, and to make it difficult to command or direct economic activity in support of military ends.

To this end it shall be the policy of the Supreme Commander:

(A) To prohibit the retention in or selection for places of importance in the economic field of individuals who do not direct future Japanese economic effort solely toward peaceful ends; and

(B) To favor a program for the dissolution of the large industrial and banking combinations which have exercised control of a great part of Japan's trade and industry.

3. Resumption of Peaceful Economic Activity.

The policies of Japan have brought down upon the people great economic destruction and confronted them with the prospect of economic difficulty and suffering. The plight of Japan is the direct outcome of her own behavior, and the Allies will not undertake the burden of repairing the damage. It can be repaired only if the Japanese people renounce all military aims and apply themselves diligently and with single purpose to the ways of peaceful living. It will be necessary for them to undertake physical reconstruction, deeply to reform the nature and direction of their economic activities and institutions, and to find useful employment for their people along lines adapted to and devoted to peace. The Allies have no intentions of imposing conditions which would prevent the accomplishment of these tasks in due time.

Japan will be expected to provide goods and services to meet the needs of the occupying forces to the extent that this can be effected without causing starvation, widespread disease and acute physical distress.

The Japanese authorities will be expected, and if necessary directed, to maintain, develop and enforce programs that serve the following purposes:

(a) To avoid acute economic distress.

(b) To assure just impartial distribution of available supplies.

(c) To meet the requirements for reparations deliveries agreed upon by the Allied Governments.

(d) To facilitate the restoration of Japanese economy so that the reasonable peaceful requirements of the population can be satisfied.

In this connection, the Japanese authorities on their own responsibility shall be permitted to establish and administer controls over economic activities, including essential national public services, finance, banking, and production and distribution of essential commodities, subject to the approval and review of the Supreme Commander to assure their conformity with the objectives of the occupation.

4. Reparations and Restitution.

Reparations

Reparations for Japanese aggression shall be made:

(a) Through the transfer—as may be determined by the appropriate Allied authorities—of Japanese property located outside of the territories to be retained by Japan.

(b) Through the transfer of such goods or existing capital equipment and facilities as are not necessary for a peaceful Japanese economy or the supplying of the occupying forces. Exports other than those directed to be shipped on reparation account or as restitution may be made only to those recipients who agree to provide necessary imports in exchange or agree to pay for such exports in foreign exchange. No form of reparation shall be exacted which will interfere with or prejudice the program for Japan's demilitarization.

Restitution

Full and prompt restitution will be required of all identifiable looted property.

5. Fiscal, Monetary, and Banking Policies.

The Japanese authorities will remain responsible for the management and direction of the domestic fiscal, monetary and credit policies, subject to the approval and review of the Supreme Commander.

6. International Trade and Financial Relations.

Japan shall be permitted eventually to resume normal trade relations with the rest of the world. During occupation and under suitable controls, Japan will be permitted to purchase from foreign countries raw materials and other goods that it may need for peaceful purposes, and to export goods to pay for approved imports.

Control is to be maintained over all imports and exports of goods, and foreign exchange and financial transactions. Both the policies followed in the exercise of these controls and their actual administration shall be subject to the approval and supervision of the Supreme Commander in order to make sure that they are not contrary to the policies of the occupying authorities, and in particular that all foreign purchasing power that Japan may acquire is utilized only for essential needs.

7. Japanese Property Located Abroad.

Existing Japanese external assets located in territories detached from Japan under the terms of surrender, including assets owned in whole or part by the Imperial Household and Government, shall be revealed to the occupying authorities and held for disposition according to the decision of the Allied authorities.

8. Equality of Opportunity for Foreign Enterprise Within Japan.

The Japanese authorities shall not give, or permit any Japanese business organization to give, exclusive or preferential opportunity or terms to the enterprise of any foreign country, or cede to such enterprise control of any important branch of economic activity.

9. Imperial Household Property.

Imperial Household property shall not be exempted from any action necessary to carry out the objectives of the occupation.

NEAR EASTERN AFFAIRS

By Grant S. McClellan

Research Associate, Foreign Policy Association

GENERAL

It was apparent before the close of hostilities in 1945 that further military operations would not take place in the Near East, yet the first period of peace brought many difficult problems of adjustment to the Arab lands. The most outstanding developments of the year concerned the Franco-Syrian dispute and the November uprising in the northwest Azerbaijan province of Iran. Of major significance also was the fresh start made toward a solution of the long-standing Palestine question by the institution of a joint Anglo-American Commission to study the Palestine mandate in relation to the European refugee problem. Both the Azerbaijan coup and the Franco-Syrian conflict, as well as the new Palestine Commission, reflected continued Big Three interest in the Near East.

RUSSIAN AND AMERICAN INTEREST

While the year 1945 showed a definite decline of French influence in the Levant, Russian and American concern about the Near East was on the rise. No clearer evidence of this was needed in the case of the United States than President Roosevelt's dramatic meeting with the Kings of Saudi Arabia and Egypt after the Yalta Conference. Aside from the Soviet Union's renewed concern about Iran, Russia also made demands along Turkey's north-eastern frontier and proposed changes for the Dardanelles, but no definitive charges were made during the year with regard to the Turkish border or the Straits. Nor were final decisions made during 1945 about Italy's former colonial holdings, although their ultimate disposition will vitally affect Near Eastern Affairs.

THE ARAB LEAGUE

Progress toward raising the Arab League—proposed at the Alexandrian Arab conference in September-October, 1944—to an effective political level continued during the year, but its backing and ultimate designs were still largely unknown. Convening in Cairo during the latter part of February and early March, the representatives of the Arab states signed the Constitution of the new League on March 22, 1945. Members included Egypt, Iraq, Syria, the Lebanon, Transjordan, Saudi Arabia, and the Yemen. The League also appointed an Arab representative for Palestine. The general aims of the League are stated to be the safeguarding of the independence of Arab states, strengthening their friendship and coordinating their political action. In pursuance of these objectives the League issued statements from time to time during the remainder of the year with respect to Palestine, disapproving of further Zionist efforts there, and objecting to the preservation of French influence in the case of Syria and the Lebanon.

EGYPT

Anti-foreign feeling similar to that in Iran, Palestine, and Syria was also expressed in Egypt, but little other common action occurred among the Arab states during 1945. Those Near Eastern countries—not at war with Germany and Japan—so aligned themselves with the Allies after a hint from the Yalta conferees that they must do so in order to participate in later peace negotiations. Following this lead, Arab statesmen took an active part in the San Francisco Conference in mid-summer, but they made no attempt to incorporate the Arab League into the framework of the newly formed United Nations Organization.

Effective economic cooperation among the Arab states came to a halt with the dissolution of the Middle East Supply Center. This agency, although supported by Britain and the United States, was doomed so far as post-war use was concerned. Its essential wartime task of distributing limited imports in the region gave it an unwelcome aspect. British reports indicated some attempt to salvage its work by continuing expert economic and technical assistance to the Arab governments, but more far-reaching and much needed economic cooperation among the Arab states and the great powers, which many hoped might develop from the Middle East Supply Center, proved impossible. At the end of 1944, however, an economic and financial agreement between Egypt and Great Britain was concluded with the cooperation of the American authorities. Under the terms of this agreement British imports were increased, restrictions on other imports removed, and Egypt was allocated more than £10,000,000 for purchases outside the sterling bloc during 1945.

FRANCO-SYRIAN DISPUTE

The Syrian crisis mounted just as the United Nations were convening at San Francisco. It proved an object lesson to the nations attempting to establish peace machinery for the post-war period, and it also revealed the decline of French power in the Levant. After Prime Minister Churchill's peremptory cease-fire request of May 31, and the dispatch of British troops to restore order, the French Government had little recourse but angry refusal to deal with the matter solely as a Franco-British affair. Early in June General de Gaulle clearly indicated his preference for a five-power meeting to discuss not only the problems of Syria and the Lebanon, but those of the entire Middle East. While the British did not object to United States interest in solving the dispute, the Foreign Office rejected Russian participation as suggested by the French.

France's claim that it needed to safeguard its route to Indo-China by a privileged position in the Levant was met by similar claims on the part of Britain and the United States, then involved in deploying troops to the Far East, but within the larger framework of finding terms on which both France and the Levant states might conclude the Mandate, the crucial issue during most of 1945 was the withdrawal of French influence over the *Troupes Spéciale* in Syria and the Lebanon. As noted above, the Arab League pledged its support to the Levant states, but no final conference was called among the powers to deal with the dispute. By the year's end, French control of the military forces there had been largely assumed by local authorities. An agreement signed in London on Dec. 13, 1945 between France and Britain pledged removal of remaining military forces of both nations from the Levant. The Franco-British Accord, by its terms for joint consultation on Middle Eastern affairs, goes far toward settling the long-standing rivalry between Britain and France in the area formerly under the Turkish Empire. But both Syria and the Lebanon have consistently refused to sign a treaty with France until possessed of their full sovereignty. Final disposition of the Mandatory rights remaining to France will doubtless be made only after a pattern has been established for dissolving the Mandate system or incorporating it under the newly established trusteeship régime of the United Nations Organization.

IRAN

On Nov. 16 an official statement from Teheran announced the outbreak of a revolt in the Azerbaijan province of Iran lying next to the Soviet Republic of the same name. At first the disturbance appeared as an attempt to force a change of government in Teheran, but the Iranian cabinet survived during the final two months of 1945, although the rebels proceeded to erect an autonomous government at Tabriz. While the insurgents charged the central government with corruption and inefficiency, Teheran countered the attack with charges that the coup was Russian inspired. Few observers doubted Soviet interest in the revolt, and this pattern was also repeated by Russian demands on Turkey.

Back of the Azerbaijan uprising lay a tangled story of internal troubles and international rivalries. Much poverty has persisted in the Azerbaijan province, although its mineral and oil wealth is known to be great. These two factors—internal poverty and foreign interest in oil—are but a mirror of general conditions throughout the Near East. Soviet action in the Iranian crisis appears new, but it is largely a resumption of older Russian aims elaborated under successive Czarist régimes. The present Soviet Republic of Azerbaijan, with the rich oil region around Baku, was ceded to Russia over a century ago by the Persian Shah after protracted fighting.

During the Second World War Soviet troops occupied the northern Iranian province in accord with an Anglo-Soviet Treaty concluded on Jan. 29, 1942. British troops controlled southern Iran, and American forces likewise were stationed in Iran after the creation of the Persian Gulf Command in 1942.

During 1945 the chief international issue at stake was the withdrawal of these military forces. Shortly after the London session of the Council of Foreign Ministers in September, it was announced that all Allied troops would evacuate the territory by March 2, 1946. When the November outbreak occurred the Iranian Premier appealed to the State Department in Washington about Soviet intervention. Secretary of State Byrnes, reminding the powers of their pledge made at Teheran in December 1943 to respect the sovereignty and political independence of Iran, sent a note to both Moscow and London suggesting that all troops be withdrawn by Jan. 1, 1946. This suggestion was met in the negative by Soviet authorities and Britain also then declined to withdraw its forces before March, 1946.

By general consensus Iran's oil wealth is considered the crux of the problem, for Russian interest, like that of Britain and the United States, is closely tied to the oil resources of the Arab world. At present the southern oil deposits of Iran are being exploited by British firms. In 1944 both Russian and United States interests attempted to gain oil concessions, and so pressed were the Iranian authorities that the government at Teheran was replaced. Iran finally decided no concessions were to be granted until after the war. When final concessions are made, Russian and American groups will doubtless both gain a hold in Iran's oil supplies. What is most significant about the jockeying for position in Iran's oil resources is the participation of all the Big Three, either by direct state requests or in support of private companies. This oil struggle in Iran is also repeated elsewhere in the Near East, although 1945 brought no further public developments about the petroleum reserves of the rich Persian Gulf region.

With respect to Iran the crucial question remained, once Azerbaijan had achieved its autonomy: Would the Soviet Union favor the direct incorporation of the Azerbaijan province in the Russian state? Moscow's policy in Iran, correct in all official statements, appeared similar to its policy in eastern Europe, where during and since the war Russia's aim has been to sponsor friendly governments on its border. The Azerbaijan disturbances were hardly settled, however, before the Foreign Ministers of the Big Three met in Moscow at the end of December. Yet that conference concluded by issuing lengthy communiques that did not touch on either the Iranian problem or other more general Near Eastern affairs.

TURKEY

The Turkish question also became acute again at this time. During the Moscow meeting of the Big Three Foreign Ministers, two noted Georgian scientists voiced demands that the Georgian people should get back lands now held by Turkey and that the USSR should have bases at three points on the Turkish straits.

Like demands were made on Turkey earlier in 1945 and announced to the press on June 25. Relations between Turkey and Russia were unsettled after March 19 when the USSR denounced the Soviet-Turkish neutrality pact of 1925. At that time Moscow asked for a change in the régime at the Straits, governed under the Montreux convention until the present. Although the Straits were demilitarized by the Treaty of Lausanne (1923) Turkey obtained the right to militarize the area when the Montreux convention was signed in 1936. In the announcement of June 25, Russia also demanded the return of the former Russian provinces of Kars and Ardahan. These territories are of strategic importance since they lie near the juncture of Turkey, Iran, and the USSR. They were ceded by the Soviet Government under the Brest-Litovsk settlement of 1918, and incorporated in Turkey by the Russo-Turkish treaty of 1921.

Early in November Secretary of State Byrnes issued a note to Turkey suggesting certain changes in the Montreux convention—that the United Nations Organization take the place of the League of Nations in the convention, and that the Straits should be opened to the merchant ships of all nations and to the warships of all Black Sea powers at all times. In addition, the United States Secretary of State suggested that, save for an agreed limited tonnage, passage should be denied to warships of other powers, except with the consent of the Black Sea powers or when they were acting on behalf of the United Nations Organization. But during 1945 Turkey resisted both Russian pressure for changes at the Straits and for Soviet acquisition of its northeastern provinces. It also refused to deal with the American suggestions for the Dardanelles until all the great powers were consulted.

NEW PALESTINE COMMISSION

In Palestine, 1945 opened and closed on a note of violence. During January two extremists, convicted of the murder of Lord Moyne, then British Resident Minister in the Near East, were sentenced to death at Cairo, and in December violent outbreaks again occurred in the British mandate. Meantime, growing resistance continued against the British White Paper policy prohibiting Jewish immigration. On the other hand, rising Arab interest in Palestine became evident during the year. After the formation of the Arab League, its representatives challenged further Zionist aims, and in a joint note submitted to the American Secretary of State on Oct. 12, representatives of Egypt, Syria, the Lebanon, and Iraq stated that a Zionist political state could only be created in Palestine by the aid of external force. Within Palestine the Arab leaders have also taken a more active interest in the problem of that country's future, and on Nov. 22 the Higher Arab Committee in Jerusalem was formed.

With the creation of the Anglo-American commission to study the Palestine problem afresh, a new start may be taken, but Zionist hopes for a quick reversal of British policy after the change of government in London were unrealized by the year's close. Foreign Secretary, Ernest Bevin, indicated in his press conference of Nov. 13, that Britain was bound not only by its pledge to erect a Jewish homeland but by respect for Arab rights in Palestine. Intention to create a Jewish state, as distinguished from a Jewish homeland, was definitely ruled out by Bevin. In his speech before the House of Commons on the same day he outlined the action his government intended to take before the Commission's report was received. According to the Foreign Secretary, the British Government would consult with the Arabs in order to facilitate the continuance of Jewish immigration. After hearing the commission's report and considering further alternatives for solving the Palestine problem, the British Government will prepare a permanent solution—if possible one agreeable to all parties—for submission to the United Nations Organization.

Before this statement was made by Bevin, however, three developments occurred in 1945 in relation to Palestine that gave new urgency to the problem of opening Palestine to further immigration. One was the direct intervention of President Truman by his letter to Prime Minister Attlee of Aug. 31, asking that 100,000 additional Jewish refugees from Europe be permitted to enter Palestine. The President's interest in the question arose as a result of investigations made by American officials in Germany into the wretched treatment accorded Jews since the close of the war. In reply the British Government suggested the creation of a joint Anglo-American commission to study the problem of Europe's Jewry and the Palestine controversy. The American Government acquiesced in this request, and the creation of the commission followed on Nov. 13. Meantime, letters exchanged between President Roosevelt and King Ibn Saud of Saudi Arabia, released on Oct. 18, indicated that the late President had assured the King that no settlement would be made about Palestine without consultation with both Arabs and Jews, and that no action hostile to the Arab peoples would be taken.

All of these developments—the continued plight of Europe's remaining Jewry, the publication of the Roosevelt-Ibn Saud correspondence, and the creation of the new commission—were considered by Zionist sources to amount to a severe setback for their plans, but the encouraging note about Palestine in 1945 was the official association of the United States with Britain in determining the future of the mandate. Heretofore, great public pressure has been raised in America about Palestine, but little if any public action has been taken. The new commission of enquiry is to examine political, economic, and social conditions in Palestine as they relate to the problem of Jewish immigration. Its terms of reference are broad, and in examining conditions of Jewish populations in Europe, it is hoped that the problem there may be alleviated along with arriving at final and hopeful decisions about Palestine.

THE UNITED STATES AND LATIN AMERICA

By Graham H. Stuart
Professor, Stanford University

INTER-AMERICAN CONFERENCE ON PROBLEMS OF WAR AND PEACE

The most important event in Pan-American relations of the year 1945 was the conference at Mexico City Feb. 21 to March 8. It will be remembered that in the fall of 1944 Argentina had made a formal request to the Pan American Union that an Inter-American Conference of Foreign Ministers be held to consider her relations with the other American republics. The United States was opposed to calling a conference upon such an issue and countered by suggesting a conference of the American states cooperating in the war effort to consider war and post-war problems. The Governing Board of the Pan American Union accepted the proposal of the United States with the understanding that the Argentine situation might be placed upon the agenda. However, under this arrangement Argentina, which had not been cooperating with the other American states in the war effort, would not be a member of the Conference.

On Jan. 10, 1945, the Mexican Government extended an invitation for a meeting in Mexico City to consider the following agenda: (1) Further cooperative measures for the prosecution of the war; (2) problem of an international organization to maintain peace and security so as to fit the inter-American system into a world organization; (3) economic and social problems during the war and the transition to peace and further economic cooperation to raise the standard of living; (4) the request of Argentina.

All of the republics except Argentina sent representative delegations, for the most part headed by the Ministers of Foreign Affairs. The United States delegation of 79 was headed by Secretary of State Stettinius and included Senators Connally and Austin, Representatives Bloom, Johnson, and Rogers, and Ambassadors Messersmith and Berle. Señor Ezequiel Padilla, Foreign Minister of Mexico, was elected President of the Conference.

With regard to wartime collaboration, it was decided that the Inter-American Defense Board had proven so satisfactory that it was agreed that a permanent military agency consisting of representatives of each of the General Staffs be established to collaborate for the defense of the Western Hemisphere. It was recommended that governments be given control over the manufacture and distribution of armaments both within their territories and internationally. It was further recommended that the Emergency Advisory Committee for Political Defense prepare a program to eradicate the remaining centers of Axis subversive influence, to prevent the reentry of deported persons, and to prohibit the admission of war criminals or agents of the Axis.

With regard to international organization, the Latin American states were not satisfied with the Dumbarton Oaks formula; they desired a strong regional agreement against the aggressor. The United States was concerned lest regional agreements should interfere with the new world organization which was to be established. The resulting compromise known as the Act of Chapultepec was unquestionably the most important result of the Conference.

THE ACT OF CHAPULTEPEC

The Act opens with an introductory statement of principles as established by previous conferences from 1890 to 1940, and concludes with a declaration that "the security and solidarity of the Continent are affected to the same extent by an act of aggression against any of the American states by a non-American state as by an act of aggression of an American state against one or more American states."

There follows a declaration defining aggression as armed trespass and stating that, if aggression occurs or is being prepared against any American state, the signatory states will consult as to what measures should be taken. For the existing war period such measures may include the breaking of diplomatic and consular relations, severance of all methods of communications, economic boycott, and use of armed force. For the period after the war a treaty will be concluded of a similar character which shall constitute a regional arrangement for the maintenance of peace and security in the Western Hemisphere, the said arrangement to be consistent with the purposes and principles of the general international organization.

REORGANIZATION AND STRENGTHENING OF THE INTER-AMERICAN SYSTEM

Of almost equal importance were the proposals for the reorganization, consolidation and strengthening of the Inter-American system. The Inter-American Conferences were to be held every four years instead of every five as hitherto, the next meeting to be in Bogota in 1946. The meetings of the Ministers of Foreign Affairs were to be held annually except in the year when an Inter-American Conference of the American states should be held.

The Governing Board of the Pan American Union henceforth was to consist of one *ad hoc* delegate from each American republic with the rank of ambassador but not a part of the diplomatic mission. In this way states whose governments were not recognized would still have representatives in the Governing Board of the Union.

The Governing Board was to be given broader jurisdiction so that it might act on every matter affecting the inter-American system and the solidarity and general welfare of the American states. The Chairman of the Board was to be elected annually and he was not to be eligible for immediate reelection. The Director General should be chosen for a ten-year term and not be reeligible for reelection. Also, successive Directors should be of different nationalities.

Such agencies as the Inter-American Juridical Committee, Emergency Advisory Committee for Political Defense, and Inter-American Defense Board should continue to function until the meeting in Bogota. A permanent Inter-American Economic and Social Council was created to replace the emergency agency now functioning as the Inter-American Financial and Economic Advisory Committee. The Governing Board of the Pan American Union was charged with preparing a draft charter to incorporate their recommendations.

The other two principal achievements were the "Declaration of Mexico" which reaffirmed the principles of international law and justice in inter-American relations and the "Economic Charter of the Americas" an economic Magna Carta for the American Republics.

At the end of the Conference it was agreed that, in reply to the communication from Argentina, a resolution be passed deploring the fact that the Argentine nation had not yet taken steps which would have permitted its participating in the Inter-American Conference and expressing the desire that Argentina change its policy so as to cooperate with the other American nations to the end that it might achieve its incorporation into the United Nations as a signatory to their Joint Declaration and as an adherent to the Final Act of the Conference.

In accordance with this recommendation, Argentina declared war on March 27, 1945 against the Axis Powers. On April 4 the Governing Board of the Pan American Union unanimously approved a motion to open the Final Act to Argentina for adhesion, and on April 9 the government of Argentina was recognized by the United States and three other American Republics.

The Conference of Mexico City was an important forerunner of the San Francisco Conference, and its 61 resolutions gave assurance that a regional organization already existed in the Western Hemisphere for the maintenance of peace and that it would be strengthened and reorganized to become a vital part of the new world organization.

RELATIONS WITH ARGENTINA

After Argentina had been received back into the inter-American family of nations, it was assumed that her admission to the San Francisco Conference would be assured in spite of the Péron fascist régime. However, the Russian delegate Foreign Commissar Molotoff's request for a few days consideration to be sure that Argentina had really mended her ways brought about an acrimonious debate. United States Assistant Secretary of State Nelson A. Rockefeller, with the support of the Latin American Republics, forced the issue and was successful in securing admission of Argentina into the Conference.

It was not long before the United States had cause to regret her championship of the Péron clique in Argentina. The new American ambassador to Argentina, Spruille Braden, was thoroughly conversant with Latin American ways and was a thorough and courageous believer in democratic government. His first demand was for freedom of the press for foreign correspondents, and he was temporarily successful. His militant activity in favor of a liberal press brought him the title of El Domador de Coroneles (the Colonel Tamer).

The American attitude was further shown when Assistant Secretary of State Clayton announced to the press on June 25 that Germany was establishing in Argentina money, loot, trained technical personnel, and considerable influence. He declared that, of over 100 of these principal Axis enterprises, none had been eliminated. When the government attacked Braden by posters and pamphlets, the people of Buenos Aires showed their resentment by giving Braden a warm welcome upon his return from a visit to Rosario and Santa Fé. Early in August, many organizations expressed their approval of Braden's strong stand against dictatorship.

Even Assistant Secretary Rockefeller acknowledged his mistake in an address on Aug. 24, the day before he resigned, and Ambassador Braden was recalled to take his position. Mr. Braden declared that as Assistant Secretary of State he would follow the same policies that he had pursued as ambassador.

In early October it looked as though Péron had at last lost out when his government was overthrown and Péron arrested. However, the opposition failed to establish a satisfactory interim government, and before the month was over Péron seemed to be as strongly entrenched as ever. One result of the changed attitude of the United States towards Argentina was a request that the forthcoming conference in Rio de Janeiro on Oct. 20 be postponed on the ground that the

U. S. Government did not feel that it could properly negotiate or sign with the existing Argentine régime a treaty of military assistance.

RELATIONS WITH MEXICO

The United States-Mexican Water Treaty, signed Feb. 3, 1944, came up for Senate consideration early in 1945. Practically the only opponent was California, although that state's share of the Colorado River Basin was only about 6,000 square miles out of more than 240,000 square miles, and its contribution of water was exactly nothing. Assistant Secretary of State Dean Acheson made a strong plea in behalf of the treaty before the Senate Foreign Relations Committee, and the Treaty was approved by a vote of 18 to 4. When it came before the Senate, there was little effective opposition, and the treaty passed the Senate by a large majority on April 18. President Truman voiced his approval of the Senate action and declared that "By this action of the Senate the United States and Mexico join hands in a constructive businesslike program to apportion between them and develop to their mutual advantage the waters of the rivers that are in part common to them."

The Mexican Senate approved the Water Treaty on Sept. 28, 1945, and ratifications were exchanged in Washington on Nov. 8. The treaty entered into effect immediately.

In the final report of the Mexican American Commission for Economic Cooperation it was noted that 20 projects were supported, amounting to about $25,000,000, and some 38 others were approved. In addition to its activities pertaining to general problems of commerce and industrial development, studies were made by subcommittees in the field of agriculture, aviation, highway transportation, and tourism. As a result of the work of the Agricultural Sub-Commission, more than $3,000,000 worth of agricultural machinery was shipped into Mexico.

The Mexican government made the final payment of $448,020.14, settling the claims in accord with the 1934 Convention. The total paid amounted to $5,448,020.14.

INTER-AMERICAN COOPERATION

Various evidences of increasingly closer cooperation between the American Republics appeared during the year 1945. This was particularly true in the field of cultural cooperation. During the fiscal year ended June 30, 1945, 164 persons from the United States visited the South and Central American Republics as a result of awards granted for professional visits, and in similar fashion 89 came to the United States from the republics to the south. Panama alone sent 15 students to the United States on fellowships.

A number of Conferences of a non-political nature were held during the course of the year. The Third Inter-American Conference on Agriculture was held during July and August in Caracas, Venezuela. Particular consideration was given to the problems of production, marketing, and transportation. The Third Inter-American Radio Communications Conference was held in Rio de Janeiro during September, and an important telecommunications convention was signed. An Inter-American Congress of Social Science was held in Santiago, Chile in September.

The United States signed on May 24 an agreement to send a naval mission to Chile, and three days earlier an agreement was also signed to send a military mission to Guatemala. Aviation agreements were signed by the United States with Colombia, Mexico, Peru, Brazil, and Paraguay during the year. President Rios of Chile made his long-postponed visit to the United States during the year and traveled extensively throughout the country.

A particularly friendly gesture was the donation by the Costa Rican Government of a piece of land in San José, comprising some 7,200 square feet, for the construction of a new American Embassy. President Truman expressed the hearty appreciation of the United States for this generous offer.

BRAZIL

Brazil's chief contribution to the news developments of the year was the retirement of Getulio Vargas from the presidency. President Vargas on March 11, 1945 announced that he would not be a candidate in the presidential election which would be the first to be held since he came into power in 1930. The election was set for Dec. 2, and, besides the president and vice president, voting was to elect state governors as well as members of Parliament and the state legislative assemblies. At the end of October, however, President Vargas suddenly resigned, turning over his office to the Chief Justice of the Supreme Court, José Linhares. It would appear that Vargas' resignation was not wholly voluntary since he was held in "detention" for a brief time by the military. He was soon released, nevertheless, and he retired to his country estate for a "rest." He stood for election to the Senate and was elected though he had been most noncommittal about entering public life again. Eurico Gaspar Dutra, former foreign minister in the Vargas cabinet and generally regarded as sympathetic to the Vargas political ideology, was elected president. The new Congress was to meet within 60 days of the election for the purpose of drafting a constitution to replace the 1937 charter drafted under Vargas' guidance. In all these events, however, there was little to involve United States relations in any way. In any event the political trend appeared to be in the direction of a more democratic régime and the return to constitutional forms, a trend certainly in harmony with hemispheric objectives.

FOREIGN SERVICE OF THE UNITED STATES

By Selden Chapin

Director, Office of Foreign Service, State Department

ADMINISTRATIVE REGULATIONS

The administrative regulations issued in pursuance of the Foreign Service Act of Feb. 23, 1931, as amended, are to be found in Executive Order No. 8696 of April 18, 1940. These regulations implement the act by providing, among other things, for a Board of Foreign Service Personnel, a Board of Examiners and a Board of Foreign Service Officers' Training School.

BOARD OF FOREIGN SERVICE PERSONNEL

The duties of this Board are to examine into the character, ability, efficiency, experience, and general availability of all members of the Foreign Service with a view to promotions, transfers, and separations; to consider controversies or delinquencies among the Service personnel, and to recommend for promotion to the grade of minister those officers who have shown special capacity. The Board is composed of not more than three Assistant Secretaries of State, an officer of the Department of Commerce, and an officer of the Department of Agriculture. One of the Assistant Secretaries of State is the Assistant Secretary who has supervision over the Division of Foreign Service Personnel and is chairman of the Board. The members of the Departments of Commerce and Agriculture sit only when nominations and assignments of Commercial and Agricultural Attachés, the selection or assignment of Foreign Service officers for specialized training in commercial or agricultural work, or matters of interest to those Departments, are under consideration. The Chief of the Division of Foreign Service Personnel and one other member of the Division may attend the meetings of the Board, but are not entitled to vote in its proceedings.

BOARD OF EXAMINERS

The duties of the Board are to hold examinations of applicants for admission to the Foreign Service. The examinations, both written and oral, are open only to Americans of good standing between the ages of 21 and 35, specially designated by the President for examination, who have been citizens of the United States for at least 15 years, who are physically, mentally, and temperamentally qualified for the proper performance of the duties of the Foreign Service, and who are not married to aliens. American clerks who have rendered satisfactory service in the Foreign Service for a period of five years immediately preceding the submission of their application for appointment as a Foreign Service officer may be exempted by the Board from written examinations and may be granted certain exceptions concerning age limitations. The Board is composed of three Assistant Secretaries of State, a director of the Office of the Foreign Service, an officer of the Department of Commerce, an officer of the Department of Agriculture, the Chief of the Division of Foreign Service Personnel of the Department of State, and the Chief Examiner of the Civil Service Commission.

FOREIGN SERVICE OFFICERS' TRAINING SCHOOL

The school is maintained in the Department of State for the instruction of new appointees to the Foreign

CLASSIFICATION, FOREIGN SERVICE 1945

Class II, junior clerks	Under $2,650	2,439
		2,657

Service, and is under the direction of the Board of Foreign Service Officers' Training School. The duties of the Board are to act in all matters concerning the functions of the school, with the approval of the Secretary of State; to select the director of the School from among the officers of the Foreign Service with the approval of the Secretary of State, and in its discretion to select other instructors from among the qualified officers of the Department of State, the Foreign Service, the executive departments of the Government, and other available sources. The Board is composed of the members of the Board of Foreign Service Personnel, the Chief of the Division of Foreign Service Personnel, and the Director of the School. The school was not operated in 1944. However, the facilities of the school during the wartime period, were utilized for the training of Foreign Service Auxiliary officers.

FOREIGN SERVICE EXAMINATION

Because of war conditions, it was found impracticable to hold a written examination during 1944 for appointments to the American Foreign Service. The Board of Examiners for the Foreign Service has not set the date of a later general examination. However, a so-called "In-Service" examination for which only members of the junior ranks of the service were eligible was held in March 1945, and in November 1945 a similar "In-Service" examination was held which was also open to members of the Armed Forces of the United States and to veterans of the Second World War. An examination open to applicants in these same categories is planned for 1946.

CHANGES IN DIPLOMATIC AND CONSULAR PERSONNEL

During 1945 representation near the Governments of Czechoslovakia, Denmark, Netherlands, Norway, Poland, and Yugoslavia was transferred from London to their respective capital cities of Praha, Copenhagen, The Hague, Oslo, Warsaw, and Belgrade.

The United States Legation at Helsinki, Finland was reopened. United States Missions, in charge of Foreign Service Officers, were established at Tirana, Albania; Sofia, Bulgaria; and Bucharest, Rumania; and United States Missions in charge of Foreign Service Officers with rank of minister were opened at Vienna, Austria, and Budapest, Hungary.

During 1945 the following consular offices were closed: Acapulco, Mexico; Adana, Turkey; Angra do Heroismo, Azores; Beira, Mozambique; Bucaramanga, Colombia; Camaguey, Cuba; Caripito, Venezuela; Cienfuegos, Cuba; Florianopolis, Brazil; Galway, Ireland; Gonaives, Haiti; Iquitos, Peru; Iskenderun, Turkey; La Paz, Mexico; Puntarenas, Costa Rica.

Consular offices were opened at the following posts: Le Havre and Lyon, France; Genoa and Milan, Italy; Amsterdam and Rotterdam, Netherlands; Patras, Greece; Rangoon, Burma; Shanghai, Tientsin, Hong Kong, Canton, Hankos, Peiping, and Tsingtao, China; Batavia, Java; Manila, Philippine Islands; Singapore, Straits Settlements.

The Foreign Service Auxiliary, which was added to the regular Foreign Service in 1942 in order to enable it to discharge its responsibilities in those phases of the war effort involving economic warfare, and political, economic, and cultural cooperation in the Western Hemisphere and among the United Nations, consisted as of Oct. 31, 1945, of 843 officers, 1,067 clerks, and 424 miscellaneous employees.

During 1945 there were 15 retirements, one death, and eight resignations of Foreign Service officers. On Dec. 31, 1945, the Service comprised 820 career officers.

PROMOTIONS FROM THE RANKS

Of a total of 36 ambassadors and 20 ministers, 19 of the former and 15 of the latter have previously served in the ranks of the Foreign Service or of the Department of State.

THE LEAGUE OF NATIONS AND ASSOCIATED AGENCIES

By Arthur Sweetser
United Nations Organization Conference

EVOLUTION OF AMERICAN INTERNATIONAL POLICY

The United States took, during 1945, the final steps in the complete reversal of the policy adopted in 1920 towards the three international agencies which grew out of the First World War: League of Nations, World Court, and International Labor Organization. The country had moved in this quarter century from the periphery to the very center of international organization. Where in previous years it had refused to join two of these three agencies, it now not only played a decisive role in their disposition but became the headquarters of the new agency of the United Nations.

Seldom in the history of nations has a reversal of policy been so complete. The United States had itself called the League of Nations into being towards the end of the First World War, had then in a post-war reversal repudiated its own creation, and had never during the succeeding two decades got beyond a kind of uneven cooperation. Its jurists had also largely contributed to the creation of the World Court which the Senate at once even partially ratified, but no full agreement had ever been reached, and the United States remained outside this world agency of law. Only as regards the International Labor Office had the United States succeeded in working out a complete policy of membership and cooperation.

The coming of the Second World War, the involvement of the United States despite all its efforts, and finally the atomic bomb, led to a complete reversal in public opinion and government policy. Far from eschewing international organization, the United States again took the lead, as it had at the end of the First World War. Conference after conference was organized on American soil, first on technical matters, such as relief and rehabilitation, food and agriculture, monetary and financial problems, and civil aviation, and eventually on the central problem of political action itself. The Congress had gone along step by step with the Executive, ratifying one great international agreement after the other, including, most important of all, the United Nations Charter by the overwhelming vote of 89 to 2. By the end of the year, the United States was playing with great completeness the role it had withdrawn from playing in 1919, and found itself in the curious position not only of having a decisive voice in what should be done about the League of Nations and other agencies of which it was not a member but of awaiting the arrival on its shores of an international commission to select the site of the world capitol.

UNO REPLACEMENT OF LEAGUE

Early in the war, three weeks indeed after America's entry, on New Year's day of 1942, the United Nations Declaration was signed in Washington, constituting a new international grouping, first of all, to fight the war but eventually to become a permanent continuing agency after the war.

This meant that the League of Nations would be replaced by a new and larger agency but left open the innumerable questions as to the obligations entrusted to the League in several hundred treaties, the mandated areas still under its supervision, the magnificent buildings at Geneva, and the remaining personnel. The American attitude was generally sympathetic in such matters, and the League was regularly invited to send representatives to cooperate in the various conferences and committees which were laying the groundwork of the new system.

SAN FRANCISCO DEVELOPMENTS

Most important of these was the San Francisco Conference. There the United States as "host government" issued such an invitation, and three League officials, the Acting Secretary-General, Sean Lester; the Treasurer, S. Jackson; and the senior director, A. Loveday, came respectively from Geneva, London, and Princeton. League experience and precedent were cited constantly throughout the conference, not least of all by the United States Delegation itself, despite its non-membership.

The Charter which grew out of the Conference was on lines very similar to the Covenant but with various readjustments owing both to the experience of the League and the differing political considerations, particularly the presence of two great states which had not shared fully in the League's experience, namely, the United States and Russia. Constant comparison has since been made between the two documents, as was natural given the fact that the Covenant provided a kind of starting-point of proved experience, but there has often been a lack of perspective in the judgments.

Most important was the Report to the President by the Chairman of the United States Delegation. While only one all-inclusive reference was made, and that a somewhat back-handed one, specific references were included in practically every chapter of the Report. The general introduction stated: "Twenty-six years before the San Francisco Conference met, the Conference at Paris, under the inspired and courageous leadership of Woodrow Wilson, wrote the Covenant of the League of Nations, which many believed would serve to keep the peace. That labour did not gain the wide support it needed to succeed."

The report then goes on to specific questions "raised in part by the experience of the League of Nations and in part by the nature of the problem of international organization as such, which occupied the Department and its committees from the beginning of its work to the end." In fact, from the initiation of the Department's studies, the League's experience had been a matter of prime study.

The basic organization accepted from the start closely followed that which had become familiar at Geneva. The Report comments on this point: "The League of Nations was organized in general along the above lines. It has its Assembly, in which all members are represented, its smaller Council, and its Secretariat. In addition, there are in the general framework of the League's system a variety of special bodies and committees of which the two most important are the International Labor Organization and the Permanent Court of International Justice."

UNO—LEAGUE COMPARISONS

Within this broad outline, however, there were various important rearrangements of function and power. "Perhaps the basic difference between the constitutional arrangement of the United Nations and that of the League of Nations," the Report states, "is that instead of the Assembly and the Council having identical functions, as was the case under the League, the General Assembly and the Security Council will each have different functions assigned to it."

The Report then goes into detail regarding the system of qualified majority voting in the Security Council, which is stated to represent, "an advance over the procedure in the Council of the League of Nations" and where "it is significant that no one seriously considered perpetuating the unanimity rule which operated in the League and in many other international bodies."

The provisions for peaceful settlement, as put forward in the Dumbarton Oaks Proposals, were described as "based upon the lessons learned over centuries and, more particularly, upon those from the experience of the League of Nations." The development of these methods was represented as "beginning with the Hague Conference of 1899 and reaching its highest mark to date in the rules and procedures of the League of Nations."

The method of enforcement, however, was very much sharpened through the creation of the Security Council and its affiliated Military Staff Committee. The former was pictured in the report as "without precedent in international relations; it differs from the traditional alliance and is unlike the Council of the League of Nations." Moreover, the binding effect of decisions of the Security Council was described as "a sharp departure from the League of Nations Covenant, in as much as each member of the League could determine for itself whether or not it would in any particular situation participate in sanctions." So also, the Charter differed from the Covenant in that the latter "did not contain any provision requiring member states to conclude agreements for the supply of forces to execute military sanctions.

Many other references to the League are contained in the report. There is special reference, for instance, to safeguarding "the continued operation" of the anti-narcotics agencies and to carrying on "the excellent work" of the League as regards the legal status of women throughout the world. There is reference, also, to the economic and financial work, to the desirability of continuing the registration of treaties which grew out of the first of President Wilson's Fourteen Points, and to the need of building up a strong Secretariat, where the League's experience is cited. Finally, two whole sections were devoted to other major League activities which were largely taken over in the Charter, namely, the Permanent Court of International Justice and the Trusteeship arrangements which were designed to replace the League's mandates system.

Apart from this official comparison, there were innumerable other less formal comparisons. Among these might be mentioned an analysis appearing in the State Department *Bulletin* by Prof. Clyde Eagleton; another, printed as a Senate document, by Prof. Herbert Wright; a questionnaire prepared by the League of Nations Association; and an article "Charter v. Covenant" by George Creel in *Collier's*. Most of the comparisons were, however, made from the viewpoint of the Charter and suffered somewhat from a shortened perspective and a failure to take into account the very differing political circumstances. The two documents were, indeed, more similar than dissimilar; there was honor enough for each without need for invidious comparison; and the real difference lay not in any constitutional rearrangements but in the basic political difference ensuring to the United Nations the support of the United States and Russia which had been denied to the League of Nations.

UNO ABSORPTION OF LEAGUE FUNCTIONS

The most important decision taken by the San Francisco Conference as regards the League was that requesting the Preparatory Commission to "formulate recommendations concerning the possible transfer of certain functions, activities, and assets of the League of Nations which it may be considered desirable for the new Organization to take over." First the Executive Committee and then the full Commission meeting in London in August and November respectively drew up detailed plans to take over the remaining League assets and functions practically "in toto," and authorized a special committee to negotiate with the League to this end.

Most dramatic of the recommendations was that foregoing Geneva as the international center and approving the United States for that honor and responsibility. Important politically were the recommendations as regards mandated areas, where it was assumed the United States would succeed Japan as trustee for the Pacific mandated islands. Of somewhat special interest was the recommendation to take over from the League assets the magnificent international research Library donated by John D. Rockefeller, which was considered essential for the working of the United Nations Organization but which would be sorely missed in Europe.

LEAGUE TECHNICAL SERVICES

Meanwhile, the technical services which had been given hospitality in the United States in 1940, when the German flood surged out over western Europe, continued the work which their presence in the United States had made possible. Most important of these was the Economic, Financial and Transit Mission at the Institute of Advanced Study in Princeton, which was shown in the annual report of the Institute's Director, Dr. Frank Aydelotte, to have grown from 13 to 37 members and to have had during its five years in the United States a wide field of publications and conferences.

The anti-narcotics group, which also had established a branch office in Washington in 1940, returned to Geneva in the spring of 1945. "The utility of the transfer to Washington," the Permanent Central Opium Board report stated, "was demonstrated later when Switzerland was surrounded by Axis belligerents and Axis-controlled countries, and postal communications were cut off or delayed and impaired by censorship for considerable periods." The more essential duties were, however, carried out, as the report adds, "in large measure due to the Vice-President, Mr. Herbert L. May, who unsparingly gave time and trouble in establishing, maintaining, and supervising the work of this branch office."

A third group, the Health Research Unit, which had later been established in Washington, became the first League unit to be transferred to the United Nations. In January, by agreement between the Acting Secretary-General of the League, Sean Lester, and the Director-General of UNRRA, Herbert H. Lehman, this group was transferred to the latter agency and became the nucleus of its Epidemiological Information Service.

PERMANENT COURT

At long last, after almost incessant efforts since 1907, the United States became a member of a World Court. At that distant date, the then Secretary of State, Elihu Root, had instructed the American Delegation to the first Hague Conference, to propose such a court, but none was actually created until the League of Nations, with Root's help, succeeded in establishing the Permanent Court of International Justice in 1921. Every President and Secretary of State, whether Republican or Democrat, from that time on, had urged American membership, but never had it been possible to secure unreserved Senate ratification, despite the presence successively on the bench of four of America's foremost jurists: John Bassett Moore, Charles Evans Hughes, Frank B. Kellogg, and Manley O. Hudson.

When the new United Nations Organization was under construction, however, a fresh start was made, and a special committee of jurists convened in Washington by the United States before the San Francisco Conference. The great question there, and at the San Francisco Conference, was whether to maintain the existing Court or create a new one, and while, as the American Delegation Report stated, there were "forceful arguments on both sides" it was finally decided to create a new court which was described "in a very real sense as 'only a revised Court,' the successor to the old." The American Delegation played a large part in the drafting of its Statute which was incorporated in, and ratified as part of, the Charter. Judge Hudson was present during the discussions as one of the representatives of the Court and was later nominated by several governments for the elections scheduled to take place at the meeting of the first Assembly in January, 1946.

AFFILIATED AGENCIES

The United States also took a leading part during the year in creating a series of specialized affiliated agencies which will take over in a very much larger way some of the special activities carried out by the League or other agencies. Particularly, the Government became a member of the United Nations Food and Agriculture Organization which will extend the work done both by League agencies at Geneva and the Institute of Agriculture at Rome, took a leading part in the creation of the United Nations Educational, Scientific and Cultural Organization which will greatly expand the League's work in intellectual cooperation, called the first conference for a United Nations Trade Organization which will follow on the lines explored by various League Conferences; and had the first national discussions in Washington for the creation of an international agency in the field of health, where the League had had some of its best successes. All this presaged an international machinery vastly more elaborate but very similar in principle to that initiated by the League.

PUBLIC OPINION

Sentiment regarding the League of Nations continued to evolve during the year, though still foreshortened somewhat by the nearness of present events and enthusiasms. Perhaps the fullest statement was that made by former Under-Secretary of State, Sumner Welles, on the 25th anniversary of the League on Jan. 10, 1945: "It has become the fashion during this past generation to decry the League of Nations, to stress its inadequacies and its weaknesses, and emphasize its failures. It has become a matter of second thought, not only to overlook the great accomplishments performed by the League during the earlier years between the wars, but even to consider it as an effort necessarily foredoomed to failure. Many of us have time and again endeavored to analyze and accurately to appraise its weaknesses. We will not fail to admit that the greatest obstacle in the way of its success was the failure of the people of the United States to take part in it. And yet as we look back, the Covenant of the League of Nations remains, and will remain, a high-water mark of constructive human endeavor."

Another expression from General George C. Marshall, may also be cited: "For centuries, man has been seeking, I believe, to extend this inherent order of the cosmos, toward which he strives, to the level of the entire planet. There are two ways in which this has been manifest: We might say one is by way of cooperation and the other by way of operation. Hitler, whether he knew it or not, sought to establish one kind of order in the world when he precipitated the recent holocaust. The League of Nations, on the other hand, sought to establish a global order by cooperation. It would appear that one or the other of these methods will prevail. Time and space have been so shrunken, that the world must, I believe, establish definite global rules. Community and national rules no longer suffice."

Finally, on practically the last day of the year, on the anniversary of Woodrow Wilson's birth (Dec. 28), the Woodrow Wilson Foundation, which had been created in 1922 by some 200,000 Americans to honor the First World War President and the founder of the League of Nations, granted two awards for distinguished service in the cause of the establishment and perpetuation of peace, the first to Henry L. Stimson, former Secretary of War, for his part in overcoming lawlessness and violence in the world and re-establishing the possibility of peace, and the second, to Sean Lester, Acting Secretary-General of the League of Nations, for his part in maintaining for the future both the spirit and the mechanism of the League throughout five years of war. Their acceptance statements, coming from opposite sides of the Atlantic and very opposite responsibilities, make a fitting, and a solemn conclusion to this year's review. In the view of Mr. Stimson, the failure of the United States to accept the principle of collective action among the nations of the world in the cause of peace "was mainly instrumental in bringing on the second World War." In the words of Mr. Lester, the catastrophe of war "could have been avoided by following Woodrow Wilson's sublimely common-sense vision . . . the peoples are now rebuilding that which they destroyed by timidity or neglect."

WAR AND POST-WAR CHRONOLOGY, 1945

JANUARY

1—Patton's Third Army beats off German attacks at Bastogne. Nazis attack Bitche heavily. American infantry mopping up Leyte. Air raids hit Japan from Kuriles to Celebes.

3—Patton drives towards St. Vith. Allied bombers strike Nazi supply dumps in the Ardennes bulge fighting. Superforts raid Honshu, main Japanese island. Liberators strike at Manila airfields.

4—First Army (Hodges) regains ground on northern flank of Belgian bulge; Seventh Army (Patch) holds Nazis in check on Bitche front. B-29 bombers raid Formosa.

5—Lieut. Gen. Sir Bernard Montgomery takes command of American First and Ninth Armies in the Ardennes salient. Nazis push U. S. Seventh Army back towards Saverne Gap. Japanese give up Burma port of Akyab. Heavy American air raids on Luzon.

6—Seventh Army turns force of Nazi attack near Bitche. Patton forced back. Nazis wage air attacks, V-2 bombs, on England.

7—First Army starts driving Nazis out of the Belgian bulge.

9—Strong American force lands on shores of Lingayen Bay, Luzon, with no man killed in the landing operations. Nazis strive to free Budapest from Russian control.

10—First Army wins fierce tank battle in the Belgian bulge. Russians break up Nazis' counter thrust at Budapest.

11—Third Army attack southeast of Bastogne wipes out half of enemy force in 11 hours.

12—Dardanelles Straits opened up to Allied ships by Turks. American troops drive deep into German lines in Italy.

13—First and Third Armies continue to squeeze Nazis out of Belgian bulge. Sixth Army (Krueger) drives steadily towards Manila.

17—Warsaw and Krakow fall to Russian attacks.

19—Nazis seek to encircle Seventh Army north of Strasbourg. Third Army drives forward on Luxembourg front.

21—Russians capture Tannenburg, heart of Prussianism. Defenses of St. Vith cracked by First Army. British drive towards industrial centers. French push 9 miles into Alsace. Tarlac, in Luzon, captured by Sixth Army. Formosa and Okinawa under heavy air attacks.

22—Allied planes smash German mobile equipment trying to escape from the bulge. Nazis recognize great danger threatening Berlin.

23—Russians reach Oder River on drive towards Berlin. House to house fighting in St. Vith. British near Roer River. B-29's bomb industrial targets in Nagoya on Honshu Island. Ledo-Burma Road opened.

24—Upper Silesia falls to Russians. First and Third Armies squeezing out Ardennes salient. Formosa, Ryuku, and Iwo Jima bombed by B-29's.

25—Sixth Army besieges Clark Field in drive to Manila.

26—Russians smash into Danzig, isolating Nazis in East Prussia. U. S. Ninth Army (Simpson) joins with British to form solid line along Roer River from Holland to Duren. Seventh Army drives Nazis back across Moder River. Americans drive Japanese into the hills after capture of Clark Field.

27—Third Army wipes out last of Ardennes bulge. American superforts start huge fires in bombing raids on Tokyo.

28—First Army drives to within 5 miles of German border near St. Vith. Third Army mops up Nazis in Luxembourg. Seventh Army jabs at Nazis in Alsace. American Ninth and British Second Armies join to drive into Ruhr Valley.

29—Nazi government officials begin to flee from Berlin. First Army approaches Siegfried Line. Americans beat off Japanese counterattacks on Luzon and seize Rosario.

30—Russians within 80 miles of Berlin. American First Army 3 miles inside Germany in Monschau Forest, breaking through Siegfried Line fortifications. Nazis begin to evacuate Holland. On Luzon, Americans capture San Fernando.

31—Hitler paints picture of woe and misery to his people. American troops make surprise landing 60 miles northeast of Manila on Subic Bay—no shot fired.

FEBRUARY

1—Russians within 39 miles of Berlin. Ranger attack frees prisoners of Bataan. Sixth Army 28 miles from Manila.

2—Thawing weather slows advance of U. S. First and Third Armies. Japanese force Americans to abandon 14th Air Force base at Suichwan. Big Three meet in Yalta (Roosevelt—Churchill—Stalin).

3—Two American forces converge on Manila.

4—First Army breaks through West Wall, southeast of Aachen. Third Army breaks into main Siegfried Line. MacArthur's forces drive into heart of Manila.

6—Russians establish 3 bridges over the Oder.

7—Third Army invades Germany on a 22-mile front, crossing Our and

Sure rivers. Japanese, as they withdraw, continue demolitions in Manila.

9—Japanese being driven out of Manila. Canadian First Army forms north jaw of pincers for penetration of Siegfried Line.

10—Germans open floodgates of Schwammenauel Dam, raising Roer River rapidly.

11—Canadians break into Kleve. Oil and ammunition dump of enemy wrecked in Burma.

12—Big Three announce plans to disarm Germany, determine Polish borders, and take other steps to forestall future wars. Third Army captures Pruem.

13—On 49th day of siege, Budapest falls to Russians.

14—In the Philippines, Americans seize Cavite naval base and 2 airfields.

15—Heavy bombing against Japanese from Tokyo to Yokohama. Many fires set.

16—Rail and oil centers blasted in western Germany.

17—Japanese report American landings at two places on Iwo Jima.

18—Third Army captures Rohrbach.

19—Admiral Nimitz reports Iwo Jima landing, with heavy loss of life.

21—Hitler's hideout, Berchtesgaden, bombed for first time by American flyers.

22—Americans driving Nazis out of the Saar Basin.

23—Main Allied drive against Berlin opens. Marines reach top of Mount Surabachi, Iwo Jima volcano.

24—Last of Japanese being driven out of Intramuros, walled city of Manila.

26—First Army pushes toward Cologne; Russian Army moves forward from Baltic bases; Third Army pushes forward 7 miles toward Coblenz.

27—Tanks and infantry of First Army stand 2½ miles from Ruhr Basin; Ninth Army drives against Ruhr war industries.

28—President Roosevelt returns from Yalta.

MARCH

1—President Roosevelt reports results of Yalta conference to the Congress. Planes bomb Ryukyu Islands.

2—Ninth Army reaches Rhine, capturing Neuss. Landing on Palawan reported.

3—Americans battle for Rhine bridges.

4—First Army within two miles of Cologne. Russians break through in Pomerania.

5—American infantry and tanks of First Army enter Cologne. Ninth Army closes in on Homberg. Seventh Army fighting into Siegfried Line near Saarbruecken. Russians start shelling Stettin.

7—Third Army driving towards Coblenz.

8—U. S. First Army crosses the Rhine at Remagen over famous Ludendorff Bridge. British enter suburbs of Mandalay. Chinese seize New Lashio to complete control of Burma Road from Burma to Kunming.

9—Presence of new American 15th Army (Gerow) is revealed on western front. Tokyo reports American landing on Mindanao.

12—Coblenz besieged. Nagoya burning for second day as result of bombing raids. MacArthur's troops capture airfield near Zamboanga.

13—Dortmund wiped out by air attack. Von Rundstedt ousted as Nazi commander on west front. Russians capture Kuestrin. Aleutian-based planes bomb Shumushu and Paramushiro.

14—Marines seal Japanese in Iwo Jima caves.

16—Nazis begin evacuation of Saarland and Palatinate.

17—Seventh Army enters outskirts of Saarbruecken. First Army on the 15th cuts Hitler's superhighway. Kobe set ablaze by air raids. Iwo Jima captured.

18—Ludendorff Bridge collapses but First Army builds a pontoon span. Russians capture Kolberg on the Baltic. MacArthur's troops invade Panay. Coblenz falls.

19—Third Army drives towards Mainz. Civilians flee from Rhine cities as Ninth Army advances.

20—Patton flanks Siegfried Line and moves towards junction with Patch, wiping out 45,000 of a Nazi garrison of 80,000. Trapped Japanese warships in Inland Sea smashed by American carrier planes. British capture Mogok in Mandalay. Allied planes raid Siam (Thailand).

22—Third and Seventh Armies mop up defeated Nazis in Saarland and Palatinate. Nazi chemical center of Ludwigshafen captured. Japanese evacuate 3,000,000 from Tokyo.

23—Gen. Zhukov's Russian Army breaks through Oder defenses to advance 7 miles toward Berlin.

24—British Second Army, American Ninth and First Allied Airborne Armies cross Rhine. Carrier planes blast Okinawa.

26—Third Army crashes into Frankfurt-am-Main. Ninth Army enters Duisburg. Seventh Army reaches Karlsruhe. German defenses crumbling all along the front. Philippine-based bombers blast Formosa. Americans invade Cebu.

27—Eisenhower reports German line smashed, predicts surrender when Allies link with Russians.

28—Himmler orders Nazi shrine of Nuremberg evacuated.

30—British drive to seal off north German ports. American Third Army moves towards junction with Russians. Seventh Army tries to seal off mountain routes in southern Germany to prevent top Nazis running for hideout. Russians move to besiege Vienna. Seventh straight day of attack against Okinawa.

APRIL

1—Infantrymen and Marines land on Okinawa.

3—Seventh Army cuts Wuerzberg-Ansbach rail line. British 21st Army Group enters Osnabrueck. Ninth Army advances toward Weser River. Russians seize Wiener Neustadt. Americans cut Okinawa in half.

4—Russians 6 miles from Vienna. Eighth Army (Eichelberger) seized Tawitawi Island, 30 miles from Borneo.

5—Russia denounces neutrality pact with Japan. American Ninth Army returned to Gen. Bradley's command.

6—Nazis retreat to Elbe River. Fifth Army moves up west coast of Italy.

7—In stubborn fighting, Marines gain 5,000 yards on Okinawa. Japanese form new Cabinet to replace one which quit on the 5th. Nazi gold hoard seized.

8—First Army takes Gottingen; Ninth Army within 128 miles of Berlin; British 64 miles from Hamburg; American Seventh Army 95 miles from Munich; Third Army 120 miles from Berlin. Russians drive into suburbs of Vienna. Marines gain use of an airstrip on Okinawa.

9—Ninth Army enters Essen, home of Krupp iron works. Allied planes blast German submarine pens at Hamburg. Fifth Army continues its advance up Italian west coast. United States recognizes Argentinian government.

10—Ninth Army enters Hanover and cuts superhighway to Berlin. Russians nearly complete mopping up of Vienna and swing toward Munich and Prague.

11—Ninth Army captures Brunswick, 90 miles from Berlin. Fifth Army within 12 miles of Le Spezia. Invasion of Jolo gives MacArthur control of Sulu Archipelago.

12—Third Army drives toward Leipzig. Nazi collapse spreads as many cities fall. British break through German Santerno River line in Italy. Progress slow on Okinawa. President Roosevelt dies at Warm Springs, Georgia. Vice-President Truman sworn in to succeed him.

13—Stalin announces complete capture of Vienna. Japanese intensify their Kamikaze (suicide) plane attacks on American combat vessels in Okinawa area. Americans land on Bohol in the Philippines. No more Japanese shipping in South Pacific sea lanes. Heavy fire bomb raids continue against Tokyo.

14—Third Army captures Beyreuth. Ring tightens around Leipzig.

15—President Roosevelt buried in grounds of his Hyde Park home.

16—Ruhr pocket of resistance practically wiped out. British and Americans join in final push to drive Nazis out of Italy. Fire raids ruin central part of Tokyo. MacArthur's forces approach Baguio, summer capital of Philippines.

17—First Army invades suburbs of Leipzig. Dresden blasted by American heavy bombers. Americans seize Ie Island, 3 miles from Okinawa. Airfields on Kyushu bombed by Superforts as well as port of Davao and Formosa.

18—Patton's Third Army enters Czechoslovakia, cutting Germany in half. Simpson's Ninth Army captures Magdeburg on Elbe, opposite Berlin. MacArthur's troops enter Baguio.

19—Leipzig captured; Nuremburg surrounded. Russians capture Seelow and Wriezen, 18 miles from Berlin. Fifth Army in Italy within 8 miles of Bologna.

20—French First Army advances toward Lake Constance. Third Army within 55 miles of junction with Russian forces.

21—Russians enter suburbs of Berlin. Third Army captures Asch in Czechoslovakia and drives for Prague and Pilsen. Fifth Army captures Bologna in Italy.

22—Russians smash into heart of Berlin, killing thousands of Nazis. Americans and Russians within 15 miles of junction southwest of Berlin. Seventh Army crosses Danube. French First Army takes Stuttgart. Russian Foreign Minister Molotov arrives in Washington, D. C., on way to San Francisco Conference.

23—Practically all retreat routes of Germans now cut. First Army takes Dessau. Canadians attack Emden. British besiege Bremen and Hamburg. Russians capture Frankfurt-on-Oder. Fifth Army reaches Po River and French Alpine troops break into Italy from the north. Japanese retake Kakazu on Okinawa.

24—Russians complete encirclement of Berlin. Patch's Seventh Army advances on Munich. Blackout ends in London. British capture Ferrara in Italy.

25—Hitler's Berchtesgaden chalet completely wrecked by bombing attack. President Truman opens San Francisco Conference with speech by radio.

26—British Second Army captures Bremen. French close in on Munich. Russians take Stettin. Rioting Italian patriots capture all main cities in northern Italy. In San Francisco Conference, Soviets demand three votes.

27—American and Russian troops join at Torgau on the Elbe River and cut the enemy in two. Patton's Third Army invades Austria, thereby cutting off Czechoslovakia. American Fifth Army within 25 miles of Milan. Mussolini a prisoner. Suicide-crazed Japanese pilot jet rockets against American ships off Okinawa. Soviets gain 3 seats in San Francisco Conference but lose their Polish demands.

28—Three Allied armies converge on Munich as Anti-Nazi troops in city revolt. All exits from Berlin blocked. American troops reach Swiss border in Alps and seal up German troops in north Italy.

29—Italians hang Mussolini in Milan square. Genoa and Milan captured by Americans; Venice by British. Seventh Army captures Munich.

30—Peace offer reported from Himmler. General Clark reports Nazi Army in Italy is broken. Davao, Formosa, Hong Kong, and Swatow under constant attacks.

II. INTERNATIONAL AFFAIRS AFFECTING THE UNITED STATES

MAY

1—Hitler reported dead and Admiral Doenitz takes command.

2—Nazis surrender in Italy and Austria. Russians raise their flag over Hitler's Chancellery in Berlin. Von Runstedt captured by American Seventh Army. Davao, last Japanese stronghold in Philippines, penetrated.

3—British occupy Hamburg. British and Russians join to cut off Norway and Denmark. British enter Rangoon in Burma campaign. Australians move on Tarakan airfield.

4—Germans in Holland, Denmark, and northwestern Germany surrender.

6—Admiral Doenitz orders submarines to cease hostilities.

7—Germany surrenders.

8—President Truman proclaims this date as V-E Day.

9—Goering taken prisoner along with Field Marshal Kesselring. Nazis sign surrender agreement in Berlin. Nazi chief agent in Norway, Quisling, imprisoned in Oslo.

10—Largest fleet to date of Superforts bomb oil depots on Honshu and strike at Shikoku Islands. Konrad Henlein and Karlkrank, Nazi agents seized. U. S. Army announces point system for discharge from military service.

11—Superforts complete job of thoroughly mining Japan's Inland Sea. MacArthur's troops drive to surround Davao. Henlein commits suicide. Russians close in on Nazi diehards in Czechoslovakia.

12—Four American divisions unite in smashing blows against Japanese on Okinawa. American soldiers who have fought in African and European campaigns are assured they will not be sent to Pacific.

13—Mitsubishi aircraft factory and other targets blasted by air raids over Nagoya.

14—After two years of campaigning, Australians take Wewak on New Guinea. U. S. planes raid Formosa.

17—Nagoya again blazing from air raids. American infantry moving toward Shuri on Okinawa.

18—United States to share occupation zone in Germany with the French.

19—Superforts raid Tokyo and Hamamatsu. Japanese abandon Foochow on Chinese coast. American Fifteenth Army takes control of Rhine, Saar, and part of Ruhr Valley.

20—Americans begin encirclement of Shuri on Okinawa.

21—Yugoslavs pull out of Carinthia and Styria in Austria; still hold Trieste.

23—Churchill resigns but heads interim cabinet until new elections shall have been held. Arabs in Palestine stage a general strike, supporting Syrians and Lebanese. Russia demands 16 seats in United Nations organization.

24—Tokyo again set afire by raids. Japs on Okinawa caught in pincers at Shuri. Himmler, Nazi Gestapo chief, commits suicide.

25—Chinese take main Japanese base of Hwaiyuanchen in Kwangsi.

26—Tokyo again fired by bombing.

27—MacArthur's planes strike at Japanese in Dutch East Indies. French troops warring with Lebanese and Syrians. Chinese recapture Yunning, key to Japanese supply line.

29—B-29's raid Yokohama. British tell French to withdraw their troops from Levant area.

30—Marines enter Shuri Castle in southern Okinawa. Krueger's Sixth Army smashes Japanese line near Manila.

31—Chiang resigns as Premier of China; succeeded by T. V. Soong. United States supports British in orders given British troops to end strife between the French and the Arabs.

JUNE

1—Superforts blast Osaka. MacArthur quickens action on Borneo.

2—Japanese main line of defense on Okinawa obliterated. Japanese resist stubbornly on Mindanao.

U. S. Forces enter Norway in the interests of law and order.

3—American forces trap Japanese on Chinen Peninsula on Okinawa. MacArthur's troops wiping out Japanese on Mindanao.

5—Governments of United States, Great Britain, Russia, and France agree to whittle Germany down to her Dec. 31, 1937 size. Fire bombs dropped on Kobe. After five years of exile, King Haakon returns to Norway. Twenty-one U. S. warships damaged by typhoon near the Ryukyus.

6—Chinese recapture former American air base at Liuchow.

8—Japanese remaining on Okinawa hemmed in by flame thrower and grenade attacks. Huge fleet of carrier planes sent by Admiral Halsey against southern end of Kywsho.

9—Australians land on Labuan Island in Borneo area. Chinese reach Indo-China border by breaking through Japanese lines. Halsey's planes hit at Japanese naval base at Kanoya. Nearly 2,000,000 homeless by reason of raids on Tokyo.

11—American battleships shell Okinawa to aid land attack. Australians land on northwestern Borneo. MacArthur's forces gaining ground on Luzon.

12—American landings on southern Okinawa trap remaining Japanese on island. Many Japanese destroyed in caves ruined by demolition bombs. Americans advancing on Brunei, capital of north Borneo. Chinese capture port of Pingyang.

14—Encircled Japanese launch desperate counterattacks on Okinawa. American Third and Seventh Armies selected as occupation forces for Germany.

15—Osaka severely bombed in effort to wipe it out. Australians capture Brunei. Allied planes attack oil fields at Balikpapan on Borneo. American task force shells Kurile Islands twice in 24 hours. Von Ribbentrop, German Foreign Minister, captured.

16—Airfields on Borneo being rapidly captured by Australians.

17—Many Japanese industrial cities bombed in effort to wipe out small factories. Japanese bases on Formosa bombed.

18—MacArthur drives forward in northern Luzon. General Eisenhower greeted by cheering thousands in Washington, D. C. General Buckner killed in front line fighting on Okinawa.

19—Japanese suicide plane sinks U. S. destroyer *Emmons*. Australians cut Japanese food supply line on Bougainville. Bombing raid of B-29's practically destroys Shizuoka.

20—MacArthur 100 miles from northern tip of Luzon; Chinese close in on airfield at Liuchow. DeGaulle asks that British help to end Levantine strife.

21—Okinawa falls. General Stilwell succeeds General Buckner in command of Tenth Army. U. S. destroyer *Abele* sunk by suicide plane. Brunei Bay harbor entrances entirely controlled by Australians. Italians drag 30 Fascists from jail and kill them.

22—Superforts hammer at Kure arsenal. Filipino guerrillas get behind Japanese positions in northern Luzon and block their retreat. Baruch advises destruction of all German industry as a guarantee of future peace.

23—Navy states that Japanese suicide planes operating at Okinawa cost U. S. 10 vessels sunk and 52 damaged. Chief of Staff Gen. Marshall shows plan to blast Japan with 1000-plane B-29 raids daily. Rocket-firing planes add to success of American raids in Tokyo area. Liuchow airfield burned by retreating Japanese.

24—Australians drive southward on Borneo to capture Miri oil fields. Chinese rolling up Japanese on coast in direction of Shanghai.

25—Americans begin to use captured Okinawa airfields as base from which to bomb Kyushu, base of Japanese suicide bombers. On Mindanao, Japanese forces split and under heavy pressure on both sides. Cities on Formosa practically wiped out. Belgian Communists oppose King Leopold remaining on the throne.

26—B-29's attack munitions factories on Honshu. United Nations Charter signed in San Francisco.

27—Bombing concentration on aviation gasoline refinery at Yokohama. At home, Stettinius resigns as Secretary of State to become American representative on United Nations Peace Council.

28—American task force in North Pacific sinks most of Japanese convoy in Okhotsk Sea, between Kamchatka and the Siberian mainland. U. S. carrier *Bunker Hill* seriously damaged by enemy bombing. American losses in Okinawa campaign tentatively set at 46,319 (of whom 11,897 were listed as killed or missing) and 33 ships sunk—60 damaged.

29—Japan plans to move its industries to Manchukuo but is hampered in every move by attacks of American ships and planes. Sasebo shipbuilding yards fired by Superfort raid. For the first time since 1942, the American fleet sails the Makassar Straits, between Borneo and the Celebes. Chinese capture main airfield at Liuchow. Senator Vandenberg, Michigan, asks Senate to accept San Francisco Charter.

30—Tarakan oil fields now being used by Allies.

JULY

1—Huge force of B-29's drop fire bombs on Kure naval base, on Shimonoseki, an important port, Ube, a mineral center, and Kumamoto, industrial center. Formosa and Japanese installations on Java also bombed. Australians make beach landing near Balikpapan, practically without casualties.

2—United States submarines sink 10 more enemy ships. President Truman urges ratification of San Francisco Charter.

3—American raids on Formosa wipe out alcohol industry, important to production of synthetic gasoline. Tanks of U. S. Army enter Berlin as first American unit of occupation forces.

4—Shikoku and Kobe bombed. Japanese report to date that nearly 5,000,000 are killed, injured, or homeless as a result of American bombing of five main cities—Tokyo, Yokohama, Nagoya, Osaka, and Kobe.

5—General Spaatz, former director of the air campaign against Germany, put in charge of all air forces in the Pacific. MacArthur states that Philippines are now completely rewon.

6—American 5th Air Force moves up to Okinawa base from the Philippines to join in attacks on Japan. Borneo refineries set on fire by fleeing Japanese. Australians mopping up Balikpapan area. Chinese recapture 3 more Kiangsi centers.

7—B-29 raid over Honshu Island obliterates Japan's largest aluminum producing center as well as her greatest oil refineries. Japanese retreat in the Balikpapan area becomes a nightmare of horror as they are attacked by the Australians in front and by head-hunting Dyaks from the jungles in rear.

8—Two more Japanese homeland airfields wrecked. French move into Saar Basin to begin occupation duties. Tito accuses Greeks of seeking to provoke a fight by firing across Yugoslav border.

9—American planes raid Omura naval base and airfields at Kyoto, Ozaka, Kobe, and Toyhashi. Chinese clear Japanese out of Kwangsi Province. Naval vessels and planes support Australians in driving Japs from Balikpapan area.

10—Heaviest carrier-borne raid to date smashes 80 Japanese airfields in Tokyo area. Raid carried on for many hours, American planes shuttling back and forth from close-in carriers to Tokyo area.

Included in this tremendous mobile, striking force, greatest known to history, were the battleships *Iowa, Massachusetts, Indiana,* and *South Dakota* and the carriers *Essex, Lexington, Independence,* and *San Jacinto.*

11—Australians complete capture of Balikpapan. Chinese recapture Sincheng.

12—American planes break up attempt of Japanese to run a convoy from Malay to the home islands. Planes from 2 British carriers raid Sabang Island, near Sumatra.

13—British Navy and planes attacking Nicobar Islands and Sumatra airfields.

14—Admiral Halsey's fleet, from 10 miles offshore, shells the industrial city of Kamaishi on Honshu Island. Steel mills and coke ovens wiped out by this bold raid. Hokkaido set ablaze by 1,000 plane, carrier-based raid. General Chennault, famed commander of the Flying Tigers, resigns from Army. Australians moving up to Sambodja oil fields.

15—Halsey's fleet bombards Muroran, industrial port on Hokkaido, and leaves its steel mills and factories a mass of ruins. Superforts destroy oil refinery at Kudamatsu. Chinese recapture airbase at Kanshien. British capture key city of Myikyo in Burma. President Truman and Prime Minister Churchill arrive in Potsdam, Germany, for Big Three Conference.

16—Round-the-clock bombing of Japanese cities continues. Big Three meeting at Potsdam delayed by non-arrival of Premier Stalin.

17—Task force from U. S. 3d Fleet, with battleship *Iowa* in the lead, goes in close to shore and hammers shell industry city of Hatachi, only 80 miles from Tokyo. Line of firing ships only 6 miles offshore. No resistance by enemy. Elsewhere American planes strike countless targets, aiming at arsenals, aircraft and armament centers, tool and machinery centers, and transportation hubs. Chinese capture Moncay on Indo-China border. Stalin arrives in Potsdam, and Big Three talks begin.

18—Japanese cities under ceaseless bombing attacks.

19—Japanese hold rally in Tokyo under title of "Society for Bombing America." Chinese drive Japanese out of Indo-China.

20—Shanghai gets its heaviest B-29 raid. Australians capture Sambodja on Borneo. U. S. House of Representatives passes bill for expanded funds for Export-Import Bank (increase of $2,800,000,000). Bretton Woods monetary plan bill also passed.

21—Chinese closing in on Kweilin on three sides. Italy receives $100,000,000 in Lend-Lease goods. Japanese try to break out of Burma trap. Allied planes hammer Japanese from Indo-China to Honshu.

22—Trial of Marshal Pétain starts.

23—MacArthur estimates Japanese shipping loss in past 14 days at 791 and plane loss at 596. American 6th Division captures Japanese stronghold in northern Luzon.

24—Kure naval base, Nagoya, Osaka, Paramushiro, Chichi Jima bombed heavily.

25—Halsey's 3d Fleet bombards Kanagawa, east side of Tokyo Bay. Oil refineries at Mitsubishi, Hayama, and Asaishi bombed by Superforts. Chinese crash into Yangso.

26—Churchill's party in England defeated 2 to 1 in general elections. Attlee succeeds Churchill as Prime Minister. Japanese chemical centers destroyed. Namyung captured by Chinese. Big Three ultimatum calls upon Japan to surrender or face complete destruction.

27—Tokyo refuses surrender demand, whereupon American 20th Air Force furnishes Japanese Government with list of the next 11 cities to be bombed.

28—With destruction of Japanese battleship *Hyuga* all of their battleships can now be classed as either sunk or damaged.

29—Halsey's fleet sinks Japanese battleship *Haruna*. Six of the cities listed by 20th Air Force blasted by heavy raids.

30—Japanese airfields from Kyushu to Tokyo hit by continuous bombing by carrier-based British and American planes.

31—Laval surrenders to Americans in Austria. General Le May, 20th Air Force, adds 8 more Japanese cities to the list of those destined for destruction.

AUGUST

1—Big Three and Potsdam Conference. U. S. Army furloughs 4,000 for work on railroads in connection with redeployment problem. Laval taken back to France for trial.

2—Wake Island bombed. Big Three release to the press the results of Potsdam Conference.

3—Complete blockade of Japan achieved by means of mines dropped from planes.

4—MacArthur announces that mighty invasion force is being organized.

6—Japanese city Hiroshima detroyed by one atomic bomb dropped from an American plane.

7—Superforts smash naval arsenal at Toyokawa.

8—Russia declares war on Japan.

9—Second atomic bomb dropped on Nagasaki.

10—Tokyo broadcasts offer to surrender. Lacking official confirmation, fighting continues.

12—False radio flash starts celebration. Report denied in two minutes. Russians enter Korea and seize Japanese naval base at Rashin. Russians also drive into Manchuria.

13—Japanese report receipt of surrender note.

14—President Truman, at 7 p.m., announces that Japanese have accepted Allied surrender demand. General MacArthur placed in full command of situation to negotiate the terms and to govern Japan through the throne.

15—Gasoline and fuel oil rationing ended in United States.

17—MacArthur, tired of stalling tactics, abruptly orders Japanese to send their peace envoys to Manila without delay.

18—Chinese enter Canton and make arrangements to accept surrender of all south China Japanese. Japanese on Bougainville surrender to Australians. Japanese continue to fight Russians in Manchuria.

19—Japanese envoys confer in Manila. General Wainwright and several hundred other U. S. prisoners set free from Japanese prison camp in China.

20—Emperor's representatives leave Manila to carry terms back to Tokyo.

22—MacArthur reports that terms will be signed in Tokyo area Aug. 31.

25—Typhoons in Japanese area delay signing surrender terms—schedule moved forward to Sept. 2, instead of Aug. 31.

26—MacArthur issues instructions for American occupation of Kagoshima area. Russians formally recognize Generalissimo Chiang Kai-shek's government as supreme in China. General De Gaulle, on a visit to the United States, laid a wreath on President Roosevelt's grave.

27—Japanese troops surrender by thousands daily. Transport planes start to land technical troops at Atsugi in preparation for the surrender ceremonies. Minesweepers clear a path through Uraga Strait. President Truman indicates need for draft in the 18-25 year group for some time to come. Navy announced plans to reduce its personnel in the next 12 months by 2,900,000.

28—Navy patrol for Tokyo area to consist of the 3d Fleet, 5th Fleet, 7th Fleet, and North Pacific Force. In the Kuriles, Russians occupy Shimushiru, Uruppu, and Otorofu. U. S. Army announces plans to cut from present strength of 8,050,000 to 2,500,000 by next July.

29—Troops of 11th Airborne Division begin to arrive at Atsugi in 2-minute intervals. President Truman released to the public the findings of the Pearl Harbor Army and Navy inquiry boards.

30—MacArthur sets up temporary headquarters in New Grand Hotel in Yokohama. American Eighth Army due to arrive tomorrow. French ask for loan of $1,000,000,000.

31—Eighth Army begins to land at Yokohama. Death penalty demanded in trial of Quisling.

SEPTEMBER

1—Admiral Nimitz authorized to take the surrender of Japanese troops in the Ryukyus, Bonins, and the mandated islands; MacArthur to handle those in Japan's home islands, south Korea, and the Philippines.

2—General Yamashita, "Tiger of Malaya," surrendered. Under the command of General MacArthur, surrender terms signed aboard the U. S. *Missouri* in Tokyo Bay.

5—Congress reconvenes. Navy wants to hold 9 major bases in the Pacific and 6 in the Atlantic. Merger into a single department of National Defense is sought for Army, Navy, and Air Forces.

6—Ex-Nazi leaders being rooted out and arrested by the thousands. Promises given American people that most of the rationing program will be abandoned this year.

7—American troops entered Tokyo and raised the Stars and Stripes over General MacArthur's headquarters in the American Embassy.

8—Troops of American 7th Infantry Division land in Korea. Chinese to receive surrender of 1,000,000 Japanese at Nanking today.

9—General MacArthur announces that Japanese will be allowed to govern themselves as long as they and the Emperor obey orders. Navy asks Congress for 1,079 ships.

10—Koreans protest retention of Japanese officials in administrative positions. General Wainwright given great reception in Washington, D. C.; awarded the Congressional Medal of Honor.

11—Koreans assured that Japanese officials will be ousted as soon as competent Koreans can be developed to do the jobs.

14—In retaliation for unauthorized strikes, Ford Motor Co. shut down temporarily.

16—Yugoslavia serves notice that she will present a demand to the Foreign Ministers' Council for allocation to her of Trieste, Fiume, and other Italian territory.

17—American 6th Armored Division returned to United States and demobilized.

18—Secretary of War Stimson resigned and Under-Secretary Robert P. Patterson named to succeed him.

20—General Marshall tells Congressional delegation that points-for-discharge are due for early and drastic reduction.

23—Auto workers preparing to take a strike vote.

24—Socialists gain in local elections in France. Great Britain and the United States signed a new oil agreement.

25—If Hungary holds free elections, she will be recognized by the United States. MacArthur thinks that Japan will be occupied for many years but with a small force. President Truman asks Congress to cut $28,692,772,000 from the Army budget. New York elevator operators strike spreads.

26—Hirohito became the first Japanese Emperor to visit a foreign conqueror when he called on General MacArthur.

27—Foreign Economic Administration abolished.

28—British rush troops to Java where some Indonesians had revolted; other troops were sent to Indo-

China where Annamese were rioting. U. S. strike situation still bad.

30—American troops seize 21 Japanese banks in 7 cities.

OCTOBER

1—President Truman orders reorganization of the Navy. Secretary of Treasury Vinson recommends $5,000,000,000 tax cut. Secretary of Labor Schwellenbach asks oil field strikers to go back to work.

2—First peace parley after Second World War, the Foreign Ministers Council, ended in failure after being in session 22 days. Seemingly no common meeting ground of interests of Great Britain, United States, and Russia. General Truscott takes over General Patton's Third Army Command; General Patton takes over Fifteenth Army command.

3—Street fighting breaks out in Kunming between troops of Chungking government and those of General Lungyuh, former governor of Yunnan Province. President Truman favors outlawing use of atomic bomb. Under Presidential order, Government seizes struck oil properties. Longshoremen strike in New York.

4—General MacArthur orders dismissal of Home Minister Yamazaki and abrogates all laws limiting freedom of speech, religion, and opinion. Also abolishes secret police who formerly enforced such laws. Japanese Cabinet quits. Surabaya, Bandung, and other principal cities of Java in hands of Indonesian nationalists. U. S. House of Representatives votes sizable tax reduction, also votes favorably for President Truman's plan to reorganize executive agencies. Navy ordered to operate oil companies seized under Presidential order.

5—Navy announced that its losses during the war totaled 699 vessels of all types. Telephone operators out from 2 to 4 p.m. Oil production resumed in 15 states. Ford Motor Co. announced resumption of automobile production.

6—Navy reduces points to speed demobilization of its personnel.

8—President Truman states that no other nation would share with the United States, Great Britain, and Canada the secret of the atomic bomb. Coal miners and longshoremen strikes still not settled.

9—Pierre Laval sentenced to death.

10—Secretary of State Byrnes invites 9 nations to send delegates to Washington on Oct. 23 to form a Far Eastern Advisory Commission to study matters not concerned with military affairs or territorial adjustments. President Truman appeals for end of industrial strife.

11—General MacArthur directs Japanese Premier to write a bill of rights into Japan's constitution to give women suffrage, encourage unionization of labor, liberalize education, substitute justice for inquisition, and thoroughly democratize Japan's economic institutions.

12—General Eisenhower announces that not a single Nazi will be allowed to vote in German elections.

13—Indonesians issue a proclamation declaring war on Netherlanders and all their allies.

14—Japanese General Staff Headquarters dissolved. Allies take over Batavia and decree death for looting, sabotage, and carrying of arms—a very definite answer to the Indonesian Party declaration of war. Arab-Jewish situation in Palestine still unsettled.

15—Pierre Laval executed. Tried to commit suicide by poisoning. General MacArthur announces that Japan's demobilization is complete. New York longshoremen strike no nearer settlement.

16—Netherlands offers Dominion status to Indonesia. First break in longshoremen strike as several thousand go back to work. In Greece, Archbishop Damaskinos resolved the political crisis temporarily by assuming the premiership. Secretary of War Patterson asks Congress to sponsor a single department of national defense. John L. Lewis, in a surprise move, calls off the soft coal strike.

18—Indonesians threaten war for years to come unless given their freedom. On the 18th day, longshoremen's strike is ended.

20—Bitter fighting in Venezuela between revolutionists and those loyal to the President. Argentina forms a new Cabinet satisfactory to Colonel Peron. Plans made for beginning of Japanese atrocity trials. Indonese appeal to President Truman.

21—British troops restore order in Bandung and Semarang in Java. Revolutionists depose President Medina in Venezuela.

22—A new bill of rights was decreed by Allied Control Commission for all Germans, regardless of race, religion, or political belief. Taxes raised sharply in an attempt to curb inflation.

23—De Gaulle plans unity government in France, following a general election which strengthened his party. President Truman urges Congress to provide military training for all males, sometime between the ages of 17 and 20, makes a sharp distinction between this training and conscription. Admiral King and Secretary of Navy Forrestal oppose a single department of national defense.

24—United Nations Charter became part of the law of nations when the 29th country, Russia, ratified, this date. General MacArthur orders Japan to recall all diplomatic representatives and turn over embassy and consular property to the Allies. General Motors employees vote on authorizing a strike if their demand for 30 per cent wage increase is denied.

25—Indonesians seek parley with Netherland officials. New regime in Venezuela recognized by Paraguay, Ecuador, and Cuba. Result of General Motors employee vote was 6 to 1 for strike.

26—Japan votes its War and Navy offices out of existence. Terrorism spreads in Batavia.

28—Communist party in Chungking states that undeclared civil war is going on in at least 11 provinces in north China. Indonesians fire on British Indian troops at the Surabaya naval base.

29—Getulio Vargas resigns as President of Brazil and is succeeded by Supreme Court Justice José Linhares. General Marshall cautions the nation against too rapid cutting of military forces. Automobiles declared off rationing. United Steel Workers Union files strikes notices covering 769 plants and 750,000 workers.

30—Indonesian mob kills British General A. W. Mallaby while he was trying to halt a fight in Surabaya. United States recognizes new Venezuelan Government.

31—General Eisenhower warns of unrest in Germany as a result of occupational government. Japanese navy units either sunk or parcelled out to the United States, Great Britain, China, and Russia.

NOVEMBER

1—Attempts to build up Prince Konoye as liberal leader in Japan were stopped by General MacArthur. Outbreaks in Palestine resulted in 6 deaths, brought rail traffic to a standstill, and damaged shipping and industry. New government set up in Greece under Unionist Party leader, Panayotis Canellopoulis. Senate completes Congressional action upon tax reduction bill.

2—Anti-Zionist demonstrators in Cairo stone Jews and Jewish property. China plans to reorganize its army along American lines. Korea demands freedom. Indonesian riots break out again. Provisional government of Hungary recognized by the United States. U. S. Navy plans to complete demobilization by Sept. 1, 1946.

3—Armed with Japanese arms, 100,-

000 Indonesian rioters gather in central Java.

6—Foreign Commissar Molotov declares that there should be no secrecy about atomic bomb. Pearl Harbor investigation committee in Congress runs into difficulty over destruction of records.

8—United States and 13 other countries meet in Paris to determine the respective percentages of German reparations from the war zone of occupation. Indonesians ordered to surrender arms by morning of the 9th or face the force of all military arms under command of General Monsergh, Allied Commander.

10—President Truman, Prime Minister Attlee, and Prime Minister King of Canada begin discussions in Washington, D. C. as to atomic bomb, loan to Britain, and other world affairs. Chinese civil war intensified. Following Indonesian rejection of British ultimatum, British troops bomb Surabaya.

11—Uprisings feared in occupied Germany because of cold and hunger.

13—Prime Minister Attlee addresses the American Congress. Destruction of German war industries begins in Bavaria. DeGaulle unanimously elected President of the French Government.

15—New rioting breaks out in Tel Aviv area.

16—President DeGaulle submits his resignation because of inability to form a cohesive Cabinet. Food riots break out in 4 Japanese villages. Discharge points lowered by War Department.

17—Tito calls upon King Peter to renounce throne in Yugoslavia. No present end to Indonesian troubles. Strike of automobile workers imminent.

18—Rebellion breaks out in Iran. Russian newspapers accuse world reactionaries of using the atomic bomb as a weapon of power politics against Russia. Communists in France withdraw their support from DeGaulle. British take Semarang in Java fighting.

19—Chinese Nationalists capture 2 cities in their drive from Shanhaikwan to Manchuria. Fierce fighting in Surabaya. Despite Communist defection, DeGaulle will be able to form a union government.

20—Premier Canellopoulos resigns in Greece; aged liberal leader, Sophoulis asked to form a new government. Pitched battles raging in Indonesian revolt area. General Motors strike of 350,000 workers is ordered. In their conference at Washington, D. C., labor and management unable to agree over issues of collective bargaining and jurisdictional disputes. General Eisenhower appointed Army Chief of Staff and Admiral Nimitz Chief of Naval operations.

21—Chinese Nationalists pouring into Manchuria. Indonesian troops withdrawing from Batavia. De Gaulle completes formation of new Cabinet. Regent Damaskinos quits in Greece and Cabinet of Sophoulis takes over. General Motors strike 96 per cent effective. Washington, D. C. transit operators stage their second strike in 13 days whereupon President Truman orders the Government to take over and operate the facilities.

22—Japanese troops operating under British command against Javanese independence units—little hope for immediate peace.

23—Indian rioters in Calcutta damage an American hospital and U. S. officers and men are casualties from the native rioting. New violence breaks out in center of Java. All rationing of foodstuffs, except sugar, ends. General Motors rejects arbitration offer.

24—Brutality mounts in Java. Rioting continues in Bombay, India.

25—British persuade Damaskinos to remain as Greek regent. Further disturbances in Tel Aviv area over arrest of Jewish immigrants landing illegally. Russia demands participation with China in Manchurian economy. President Truman's labor-management conference in Washington, D. C., fails to produce agreement on any point after 3 weeks of discussion.

26—Washington sends note to Russia suggesting withdrawal of all foreign troops from Iran by Jan. 1, 1946. Moscow asks discussion of Palestine problem by the Big Five. General Motors rejects union's proposal to resume negotiations.

27—Major General Patrick Hurley abruptly resigns as Ambassador to China and issues a severe denunciation of career diplomats whom he said were sabotaging America's proclaimed foreign policy. President Truman immediately appointed General George C. Marshall as his special envoy to China.

28—Indonese request a truce to which British answer with warning that all native troops in the north half of the city of Batavia would be shot on sight after noon on Thursday, the 29th. Immediate demand for investigation of General Hurley's charges against career diplomats. Steel workers vote overwhelmingly for a strike call.

29—King Peter of Yugoslavia displaced and the monarchy abolished; a new government established known as Federal People's Republic of Yugoslavia. President Truman withdraws his support from a Senate resolution for establishing a Jewish Commonwealth in Palestine. After 19 days of fighting, Surabaya in complete control of British.

30—Italian Foreign Minister de Gasperi named as Premier of Italy. Communist Army of 200,000 strikes into Shantung Province. Labor-Management Conference in Washington, D. C., ends its 25 days of meeting without any outstanding or concrete results.

DECEMBER

1—General Hurley refuses to appear before closed session of the Senate Foreign Relations Committee—demands an end to secrecy on Administration's policy in China. U. S. Army bomber circled the world, 24,589 mile flight in 96 hours and 50 minutes flying time.

2—Pearl Harbor investigators demand all records be made available for their inspection. American industry making definite progress in rehiring veterans as they leave military service; 2,934 companies pledge to take back their old employees and, in addition, to hire more veterans for new jobs created.

3—About 550,000 now idle in 145 labor disputes, five of which constitute major strikes.

4—Army takes definite stand to support President's desire to have youth of the country undergoing military training at some period between 17 and 20 years of age. Desperate housing conditions throughout the nation being brought to attention of Congress, with particular reference to the damaging effect of these conditions upon the families of returning veterans.

8—The *Mixmaster*, XB-42 plane flew from Long Branch, California, to Washington, D. C. in 5 hours, 17 minutes; an average speed of 432 m.p.h., for the 2,295-mile trip.

9—Gen. Patton seriously injured in auto accident in Germany.

10—Dean Acheson, Under-Secretary of State, denied Gen. Hurley's charges that he had "wrecked" American policy in Iran.

11—B-29 Superfortress *Dreamboat* broke all non-stop records from west to east coast of United States—5 hours, 27 minutes, 8 seconds; 2,464 miles flown at an average speed of 450 miles an hour.

12—James F. Byrnes, Secretary of State, left for Moscow to attend conference on world problems with Molotoff of the Soviet, and Bevin of Great Britain.

14—William D. Mitchell, chief of counsel to the Congressional

Pearl Harbor Committee, announced that he and his staff were withdrawing from the investigation.

16—*Mixmaster* plane crashed near Oxon Hill, Maryland, just outside of Washington, D. C. Prince Fumimaro Konoye, three times Premier of Japan, committed suicide.

17—First United States court in Japan met to try war criminals accused of beating or killing Allied prisoners in Japanese detention stockades.

18—U. S. Supreme Court grants Japanese Lieut. Gen. Tomoyuki Yamashita a stay of execution.

19—Selective Service ends draft and induction of fathers.

21—General Patton died in Heidelberg, Germany.

22—General George C. Marshall reached Chungking as President Truman's envoy for conference with Generalissimo Chiang Kai-shek. U. S. recognizes new Republic of Yugoslavia.

24—General Patton buried in American military cemetery at Hamm.

FEDERAL JUDICIAL ORGANIZATION

By William M. Schuyler
Editor, *The American Year Book*

SUPREME COURT OF THE UNITED STATES

Harlan F. Stone (New York), Chief Justice of the United States, appointed 1941.

Hugo L. Black (Alabama), appointed 1937.

Stanley F. Reed (Kentucky), appointed 1938.

Felix Frankfurter (Massachusetts), appointed 1939.

William Orville Douglas (Minnesota), appointed 1939.

Frank Murphy (Michigan), appointed 1940.

Robert H. Jackson (New York), appointed 1941.

Wiley Blount Rutledge, Jr. (Kentucky), appointed 1943.

Harold H. Burton (Ohio), appointed 1945.

Officers of the Supreme Court: Clerk—Charles Elmore Cropley.

Deputy Clerks—Reginald C. Dilli, Hugh W. Barr, Harold B. Willey.

Marshal—Thomas E. Waggaman.

Reporter—Ernest Knaebel.

Librarian—Oscar D. Clarke.

UNITED STATES CIRCUIT COURT OF APPEALS

District of Columbia Judicial Circuit.—Mr. Chief Justice Stone.

First Circuit.—Mr. Justice Frankfurter; Calvert Magruder (Massachusetts), John C. Mahoney (Rhode Island), Peter Woodbury (New Hampshire).

Second Circuit.—Mr. Justice Jackson; Learned Hand (New York), Thomas W. Swan (Connecticut), Augustus N. Hand (New York), Harrie Brigham Chase (Vermont), Charles E. Clark (Connecticut), Jerome N. Frank (New York).

Third Circuit.—Mr. Justice Burton; Albert Branson Maris (Pennsylvania), John Biggs, Jr. (Delaware), John J. O'Connell (Pennsylvania), Herbert F. Goodrich (Pennsylvania), Gerald McLaughlin (New Jersey).

Fourth Circuit.—Mr. Chief Justice Stone; John J. Parker (North Carolina), Morris A. Soper (Maryland), Armistead M. Dobie (Virginia).

Fifth Circuit.—Mr. Justice Black; Samuel H. Sibley (Georgia), Joseph C. Hutcheson, Jr. (Texas), Edwin R. Holmes (Louisiana), Leon McCord (Alabama), Curtis L. Waller (Florida), Elmo Pearce Lee (Louisiana).

Sixth Circuit.—Mr. Justice Reed; Xenophon Hicks (Tennessee), Charles C. Simons (Michigan), Florence E. Allen (Ohio), John D. Martin (Tennessee), Thomas F. McAllister (Michigan).

Seventh Circuit.—Mr. Justice Murphy; Evan A. Evans (Wisconsin), William M. Sparks (Indiana), J. Earl Major (Illinois), Sherman Minton (Indiana), Otto Kerner (Illinois).

Eighth Circuit.—Mr. Justice Rutledge; Kimbrough Stone (Missouri), John B. Sanborn (Minnesota), Archibald K. Gardner (South Dakota), Joseph W. Woodrough (Nebraska), Seth Thomas (Iowa), Harvey M. Johnsen (Missouri), Walter G. Riddick (Arkansas).

Ninth Circuit.—Mr. Justice Douglas; Francis A. Garrecht (Washington), William Denman (California), Clifton Mathews (California), Albert Lee Stephens (California), William Healey (Idaho), Homer T. Bone (Washington), William E. Orr (California).

Tenth Circuit.—Mr. Justice Rutledge; Orie L. Phillips (Colorado), Sam G. Bratton (New Mexico), Walter A. Huxman (Kansas), Alfred P. Murrah (Oklahoma).

UNITED STATES COURT OF CUSTOMS AND PATENT APPEALS

Finis James Garrett (Tennessee), Presiding Judge, appointed 1929.

Oscar E. Bland (Indiana), appointed 1923.

Charles Sherrod Hatfield (Ohio), appointed 1923.

Joseph R. Jackson (Montana), appointed 1937.

Ambrose O'Connell (Iowa), appointed 1944.

UNITED STATES COURT OF APPEALS FOR THE DISTRICT OF COLUMBIA

D. Lawrence Groner, Chief Justice.
Harold M. Stephens.

United States Attorney, District of Columbia.—Edward M. Curran.

Assistants.—John W. Fihelly, Charles B. Murray, George E. McNeil, Cecil R. Heflin, Grace B. Stiles, John B. Diamond, Arthur J. McLaughlin, William Hitz, Stephen C. Miller, Sidney S. Sachs, John C. Conliff, Jr., John P. Burke, Ray L. Jenkins, Sylvan Schwartz, Joseph F. Lawless, Helena D. Reed, John J. O'Leary, Daniel B. Maher, Andrew J. Howard, John D. Lane, William S. McKinley, Evan T. Davis, Brewster H. Marshall, Edward Molenof, John Lewis Smith.

III. THE NATIONAL GOVERNMENT

CIVIL SERVICE IN THE UNITED STATES

By Harry B. Mitchell
President, The United States Civil Service Commission

THE MERIT SYSTEM—POST-WAR

The end of the fighting, while relaxing certain pressures on the United States Civil Service Commission, especially in the field of recruiting, raised other and more perplexing problems.

New procedures will be required to change as rapidly as possible from the limited type of appointments permissible under the War Service Regulations which became effective March 16, 1942, to the permanent probational type required in peacetime. War agencies are being liquidated in whole or in part, the general force of employees is being rapidly reduced, and Congress in 1944 passed a new veterans preference statute of broad scope.

The Veterans Administration which is charged with the care of the disabled veteran after his discharge from the armed forces, with the administration of the largest life insurance system in the world, and with the administration in large part of the so-called "GI Bill of Rights," is an expanding agency. The Surplus Property Administration also is on the "up" side in employment for the immediate future, and there are other activities of the Government which will, no doubt, expand to their former peacetime level. Congress is providing for further development of civilian aeronautics.

This transition period, like convalescence from a serious sickness, will involve difficult problems in attempting to restore normal civil service procedures.

PAY LEGISLATION

Two important acts involving pay legislation were passed during the year: the Federal Employees' Pay Act of 1945 and the Postal Pay Act of 1945.

The Federal Employees' Pay Act of 1945 covers (outside of the Postal establishment) the white-collar worker whose pay was fixed originally by statute in 1923. It does not cover employees (principally tradesmen) whose pay is adjusted from time to time by wage boards to conform to the pay scales prevailing in private industries in the respective local communities. Approximately 1,200,000 employees are within the terms of this new pay act.

The average increase in basic pay is 15.9 per cent, ranging from 20 per cent for the lowest paid employee groups to 8.9 per cent for the highest paid groups.

The statute makes permanent provision for overtime pay of time and a half beyond 40 hours of work a week for these white-collar workers. Beginning in December 1942, temporary legislation had authorized such overtime. The basic work week, however, was increased to 40 hours from the 39 hours previously required.

Other provisions include: (1) permitting returning veterans to count their military service toward within-grade salary advancement upon restoration to duty; (2) night pay differential of 10 per cent for work performed between 6 p.m. and 6 a.m. as a regular tour of duty; and (3) holiday pay of time and a half for work on a regular holiday.

The Postal Pay Act reclassifies the salaries of postmasters, officers, and employees of the Postal Service. It provides that for many of the positions the present incumbents will have their existing rates adjusted to increase base salary 20 per cent or $400, whichever is the lesser amount, but not less than $300.

Another difference is found in the provision relating to compensatory time in lieu of overtime for work on Saturdays, Sundays, or holidays. The postmaster is given the option to pay for overtime service in money whenever the exigencies of the service require. In the Federal Employees' Pay Act, referred to above, overtime beyond 40 hours up to 48 hours must be paid for in money, and for overtime performed beyond 48 hours the option rests with the employee to take compensatory time off.

VETERANS

According to a statement recently issued by the National Headquarters of the Selective Service System, the returning veteran who meets all the requirements of the Selective Training and Service Act for reemployment in his former job has an absolute right of reinstatement in his former position or in a substantially similar position.

The Selective Service Act is interpreted as restoring the veteran to his old job, if he meets the conditions of the act, rather than merely restoration of his "job rights" in accordance with a system of seniority. The statement reiterates the position of Selective Service that the only conditions upon the veteran's right to reinstatement are those specifically enumerated in the Act, as follows: 1. That the veteran receive a certificate of satisfactory service; 2. That he still be qualified to perform the duties of his position; 3. That he make timely application for reinstatement; 4. That the restoration be not unreasonable or impossible because of the employer's changed circumstances.

Under an executive order signed Sept. 25, 1945 by President Truman, honorably discharged veterans who have been awarded the Congressional Medal of Honor may be appointed to the position of contact representative in the Veterans Administration without reference to civil service procedures.

In an executive order of the President, signed Oct. 19, 1945, the United States Civil Service Commission is authorized to confer permanent civil service status on disabled veterans who are currently serving satisfactorily under war-duration appointments and who establish the present existence of a 10 per cent service-connected disability. The order also provides that exceptions to the war-duration limitation on appointments shall be made in the case of similarly disabled veterans who are certified from the Commission's eligible lists.

Under the National Selective Service and Training Act, veterans released from military service were formerly required to apply for reinstatement in their former jobs within 40 days after their discharge. A recent amendment to the act, signed by the President on Dec. 8, 1944, extends this time limit to 90 days. The amendment also applies the time limit to veterans released from hospitalization which continued not more than one year after separation from active military service. The revised regulations will affect employment rights of veterans returning to positions in private industry and in the Federal service.

More than 32,000 veterans, including wives of disabled veterans and the widows of veterans, were placed in Federal positions during October 1945, the total for the first ten months of the calendar year being 189,830. A total of 468,000 veteran placements have been made in the Federal civil service since Jan. 1, 1943.

EMPLOYMENT IN THE EXECUTIVE CIVIL SERVICE

As stated in 1944 the high figure in wartime employment in the Federal Government in continental United States was 3,156,953, reached in June 1943. The highest number reached thereafter was 2,941,209 in July 1944. By June 1945 it was down to 2,915,476, and thereafter the reduction was rapid. At the end of October the number employed was 2,509,914, of whom 842,930 were women. The total number employed in the Washington, D. C. metropolitan area at the end of October was 233,255, a decrease of 54,000 from the peak recorded in 1943. It is believed that another half million employees will be dropped by June 1946. The accompanying table shows the number employed at the end of each fiscal year in two-year periods. On Sept. 30, 1945 the number

	June 30, 1937	June 30, 1939	June 30, 1941	June 30, 1943	June 30, 1945
Competitive classified positions....	532,073	622,832	990,218	(*)	(*)
Unclassified and exempt positions..	309,591	297,478	367,932	(*)	(*)
	841,664	920,310	1,358,150	3,156,953	2,915,476

* Statistics showing the division between competitive classified positions and unclassified positions are no longer available under War Service appointment procedure.

of paid employees outside continental United States was approximately 850,500. These are mostly low-paid native workers employed by the Army and Navy in military occupational activities. The Army employed approximately 733,000 of these persons, and the Navy 60,000, the Panama Canal 20,000, and the Panama Railroad 6,000.

In June 1945 there were more employees of the Federal Government in the states of California and New York than in the District of Columbia. Employed in California were 317,236 and 293,021 in New York, as compared with 256,711 in the metropolitan area of the District of Columbia. Pennsylvania was next with 196,540 employees, and there were more than 100,000 Federal employees in each of the states of Illinois, Massachusetts, Ohio, Texas, Virginia, and Washington.

STATE CIVIL SERVICE

Retirement systems for municipal employees are in operation in 81 per cent, or 858, of the nation's cities of more than 10,000 population, as reported by the International City Managers' Association. Statewide retirement systems for municipal employees nearly doubled in number in 1945, when nine states adopted legislation establishing such systems and two other states amended previously enacted statutes.

Claims of three Federal employees for loss of pay were upheld in a recent unanimous decision of the United States Court of Claims. The judgment, awarding recovery of unpaid compensation up to the time the employees left the government service, grew out of a rider attached to a Congressional appropriation bill prohibiting use of the funds for payment of these employees' salaries.

COLLECTIVE BARGAINING—PUBLIC EMPLOYEE ASSOCIATION—STATUS AS "LABOR UNION"

The United States Supreme Court, in Railway Mail Association *v.* Corsi, 89 L. Ed. 1435, recently upheld the determination of the New York courts that the Railway Mail Association, a fraternal organization composed of postal employees in the Federal civil service, is a "labor organization" subject to regulation by state law. The New York statute prohibits any labor organization to discriminate in its membership on the basis of color, race, or creed.

The United States Supreme Court, in affirming the decision of the New York Court of Appeals, held that it was within the province of any state to determine the conditions under which any membership corporation may conduct its business within its borders, and that the prohibitions contained in the New York law against discrimination were in no wise repugnant to the Federal Constitution, but, on the contrary, complied with its spirit. The court overruled the contention that only the Federal Government could legislate with respect to an organization the membership of which was restricted exclusively to Federal employees.

CIVIL SERVICE BY STATES

Alabama.—During the 1945 session of the Alabama legislature, a bill was passed providing a retirement system for state employees to become effective Oct. 1. The plan provides for the deduction of 3½ per cent of employees' salaries, to be matched by state funds, to build up credits from which an annuity and pension will be paid each employee upon retirement. An employee may voluntarily retire at 60 years of age but it is obligatory that he retire when he becomes 70.

Arkansas.—A fireman who was injured while in army service claimed a pension under a typical municipal pension statute, and under a city ordinance requiring restoration of returning employees and providing that military service "shall be counted . . . as service" in the fire or police department. The court first observed that the pension statute authorized pension payments only for injuries incurred in the course of employment, and no matter how desirable the social purpose, it can not be said that military injuries come within the fair meaning of that language. As for the city ordinance, it "does not say that any injury received in the army would be considered as received while, and in consequence of, the performance of his duty as a fireman. The ordinance only says the time in the army is to be counted as though the soldier had been on constant duty as a fireman."

California.—The Supreme Court of California recently handed down a decision which hinges on the distinction between the abolition of a position and a layoff of an employee whose position has been abolished. (Stockton *v.* Department of Employment, 153 P. (2d) 741 (Cal.)). The mere abolition of a position does not automatically terminate the civil service status of the employee.

All employees except wardens of the California State prisons came within civil service jurisdiction on Jan. 1, 1945. The extension of civil service to this group of employees was a result of a law enacted by the 1944 state legislature revising the state's entire penal system.

Marysville and Contra Costa County voted in favor of the merit system. San Francisco, through charter amendments, extended its present merit system to the Steinhart Aquarium, the City Attorney's Office, and the Public Defender's Office.

Connecticut.—An ordinance permitting city employees to join municipal unions but prohibiting them from participating in a strike against the city was adopted by the Hartford Common Council. All departmental administrative heads of the city are directed by the new law to establish in their departments effective machinery whereby grievances, complaints, problems, or suggestions may be presented by the organization. The ordinance prohibits discrimination against any employee who joins the union.

Illinois.—Voters in Rockford and Quincy recently approved the establishment of civil service programs under the state enabling act. The Rockford civil service law includes all municipal employees except those of the police and fire departments, which are already covered by separate systems.

Legislation was passed in Illinois and signed by the Governor amending the state civil service law and necessitating the formulation of new rules and procedures by the state civil service commission. Among the important changes are the following provisions: Substitution of the rule of three for top eligible; extension of preference to unmarried widows or wives of disabled veterans; veterans may not be passed over by appointing officer without valid cause; state license only required for admission to examination for any trade or profession, no educational requirement; extension of time limit on eligibility for reinstatement for veterans hospitalized or taking educational opportunities.

Indiana.—Five bills were passed affecting personnel administration providing as follows: That all employees of the State and County Departments of Public Welfare are to be selected from eligible lists established by the State Personnel Board and paid in accordance with its pay plan.

A second bill amends the state personnel act to provide for the use of war duration appointments.

A third measure liberalizes previously existing veterans' preference legislation along the lines of policies prevailing under Federal legislation.

A fourth provides that time spent by employees in military service is to be included in computing seniority credit.

A fifth provides for a comprehensive public employee retirement system for state employees, which included provisions whereby employees of municipalities within the state can join in the program on a voluntary basis.

Iowa.—The state adopted a pension system for all public employees who are not now members of an existing pension plan. The new pension system became effective Jan. 1, 1946. Contributions and benefits under the system are similar to those of the old age and survivors' insurance section of the Federal Social Security Act. Legislation was adopted granting servicemen preference on public jobs and extending preference to veterans of all wars.

Kansas.—The Kansas legislature, in passing a bill creating a State Office of Veterans Affairs, specified that all personnel in the new office, except county assistants to the traveling field representatives, are to be selected in accordance with the state civil service act. Only the directors and advisory committee must be veterans.

Effective immediately, veterans receive five and ten points on civil service examinations, with 15 points awarded the disabled. The state civil service act was amended to provide for layoff procedures to facilitate reabsorption of former state employees returning from military leave, and to provide for war-duration appointments in educational and correctional institutions.

Kentucky.—Under a recent ordinance adopted by the Louisville Board of Aldermen, the positions of Chief and Assistant Chief of Police and the positions of Chief and Assistant Chief of Firemen were placed under the city's civil service system. The staff of the Louisville Planning and Zoning Commission was recently placed under the city's civil service system.

Maryland. — Montgomery County has adopted legislation providing for the establishment of a merit system for certain county employees. A civil service commissioner, appointed by the county commissioners for a term of four years, will be authorized to establish a classification plan covering positions in the county service to hold examinations and establish lists of persons eligible for the positions; to prescribe standards of performance; and to provide training facilities for old and new employees. This system allows a preference credit of 10 per cent on qualifying examinations for any Second World War veteran who has served 12 months or more and has been honorably discharged. Any veteran who has had overseas duty in this war will be granted a preference credit of 20 per cent on such examination.

Michigan.—Employees of the city of Detroit recently voted nearly 5-to-1 to accept a $500,000 hospital and death benefit insurance plan proposed by the mayor to the city council. The plan consists of two parts: (1) a mandatory death benefit (life insurance) of $2,000 for each employee, to cost $26 a year per employee with the city paying half and the employee half; and (2) a hospitalization plan that is optional with employees through contract with a private company at a cost of $17.68 per year, with the employee and city each paying half. The hospital plan, which includes surgery and x-ray, would cost the city $244,700.

Municipalities in Michigan now may participate in a statewide pension system for their employees under provisions of the recent state legislature. Civil service has been extended to the road commission employees of Wayne County, along with a pay increase of ten cents per hour, a pension plan, and classification readjustment. Alpena has installed a municipal civil service system which includes job classification, salary and wage standardization, personnel rules and procedures, and a system of forms and records.

Minnesota.—In Cranak *v.* Link, 17 N.W. (2d) 359 (Minn.) the court pointed out that, while under certain charter provisions it was proper to employ non-civil service personnel, it would be an obvious evasion of civil service requirements to change the title of the position, remove it from the classified service, and have its duties performed by the same person, outside the scope of the civil service system.

Montana.—Legislation was enacted providing for a statewide public employee retirement system.

Nebraska.—Legislation was enacted in Nebraska establishing a merit system program for clerical employees in more than a dozen state departments and agencies. Administration of the system will be directed by a council composed of three members appointed by the governor with the consent of the legislature.

Nevada.—Legislation was adopted providing a merit system for all employees of the State Board of Health.

New Jersey.—Hunterdon County and the cities of Burlington, Ocean City, and Harrison voted in favor of the merit system.

New York.—Section 22 of the New York Civil Service Law, which forbids removal of veterans except for incompetency or misconduct shown after a hearing upon stated charges, must be "meticulously" observed in order to justify a removal of a veteran.

Veterans' preference provisions in the New York state constitution were revised and broadened in an amendment approved by voters in the recent November elections. The amendment, which became effective Jan. 1, 1946, provides for several changes in existing constitutional provisions regarding veterans' preference in state and municipal employment in New York. Under the amended constitution, veterans who possess a disability certified by the United States Veterans Administration receive absolute preference in original entrance and promotional examination by being placed at the top of the eligible list. Non-disabled veterans also go to the top of the eligible list immediately following any disabled veterans on the list.

One provision of the constitutional amendment places a five-year limit on preference for non-disabled veterans. These veterans are entitled to preference until Dec. 31, 1950, if they are discharged from military service up to Dec. 31, 1945. Those who are discharged subsequent to that date are eligible for preference for five years after the date of their termination of military service. The amendment places no time limit on preference for disabled veterans.

In another proviso, the new constitutional amendment requires that in case of the need for laying off employees, members of the armed forces will be entitled to preference in retention "in inverse order" of the preference provided by the amendment.

Ohio.—Increased retirement benefits have been accorded to members of the Ohio public employees' retirement system by recent action of the state legislature. The revised retirement program includes a 50 per cent increase in prior service credits for public service before 1935, and authorizes retirement after 30 years of service, providing the member has reached the age of 55. In addition, retirement pay is now based upon the employee's average salary for the ten years immediately preceding retirement. The former basis was the pay received during the five-year period 1930 to 1934, inclusive. The employees of all municipalities in the state, regardless of population, are members of the state retirement system, except Cincinnati, which has its own system.

Oregon. — Oregon became the twenty-first state to adopt a civil service law when a bill passed during the recent legislative session was signed by the governor. Also passed during the legislative session was a bill providing for a comprehensive public employee retirement plan for state employees and for municipal employees within the state.

Pennsylvania.—An agreement between the city of Philadelphia and a local council of the American Federation of State, County and Municipal

Employees regarding wages, hours, and working conditions for more than 5,000 per diem employees in the public works department, was adopted on Dec. 7 by the Philadelphia City Council. This agreement supersedes a similar contract made in 1940 which expired on May 1, 1944. The new agreement, like its predecessor, does not mention specific wage rates.

Under the new contract, holidays are to be increased from six to seven days per year by the addition of Good Friday. Overtime, for which employees are to be paid time-and-a-half the regular rate, is to consist not only of time worked in excess of eight hours on any work day as formerly, but also on time after 44 hours work in any week even though the regular work week is 48 hours.

Additional provisions of the agreement relate to the recognition of the union as the sole bargaining agency for its members; vacation leave, payment of double time for Sunday and holiday work, and the discharge and suspension of employees. A no-strike provision is included in the contract.

An act was passed providing for the establishment and extension of civil service to fire department personnel. In boroughs, towns, and townships of the first class, where there are three or more paid fire fighters and where no civil service commission now exists, the civil service system is to be established. Three commissioners will be appointed to administer the act where no civil service system now exists.

The city council of Reading adopted an ordinance recognizing a local of the American Federation of State, County, and Municipal Employees as bargaining agents for city workers and providing paid vacations and holidays, time and one-half for overtime, and grievance procedure for protection against dismissal without cause.

South Carolina.—South Carolina adopted a constitutional amendment providing pensions for state, county, and city employees.

Texas.—Texas voters gave the cities or the state legislature authority to set up retirement systems for local governments.

Utah.—In Utah, legislation has been approved establishing a personnel system for certain employees in local governmental jurisdictions within the state. Under the law, civil service systems are to be installed in the Salt Lake and Weber County fire departments. A law has been passed for establishment of pension systems for employees of cities of the first class.

West Virginia.—Legislation was passed allowing five points to veterans and 10 to disabled veterans in merit system tests.

Wisconsin.—Ordinances establishing civil service programs have recently been adopted in Wood and Outagamie counties. In the former, the civil service program is limited to county highway patrolmen. The Outagamie ordinance calls for the establishment of a merit system covering all county employees.

DIVISION IV

STATE GOVERNMENT

STATE ADMINISTRATION AND LEGISLATION

By David W. Robinson
Council of State Governments

GENERAL

Forty-six state legislatures met in regular or special session during 1945. With the exception of Mississippi and Louisiana, the legislatures (44 in regular session) were meeting during the period of the allied war victory in Europe and were thus in a position to anticipate post-war demands upon their state facilities, services, and finances.

The general trend of legislation enacted by the states in 1945 reflected the outcome of the war, in the following broad classifications: (1) changes in state laws providing rights, benefits, and privileges to veterans, members of the armed forces, their dependents, and their continuing peacetime organizations; (2) the further development of plans and programs for dealing with existing and anticipated employment and unemployment problems; and (3) the renewal of state interest and participation in extending such social services as public housing, public health, and public education.

STATE VETERANS ORGANIZATIONS

All 48 states now have an office, department, or agency to administer veterans affairs. New state veterans agencies were created, or existing bureaus reorganized into state veterans offices, by the legislatures of 15 states in 1945: Alabama, Arkansas, Georgia, Illinois, Indiana, Kansas, Louisiana, Montana, Nebraska, New York, North Dakota, Oregon, Tennessee, Washington, and West Virginia.

Alabama's legislature set up an agency to help re-orient veterans to civilian life, and appropriated $350,000 to finance the agency, while Arkansas established a state veterans officer, and enacted legislation appropriating $95,000 a year to pay salaries of service officers in each of the state's 75 counties.

Indiana's new department of veterans affairs was established especially to aid discharged veterans in obtaining benefits to which they are entitled from the state and Federal governments.

New York approved a series of laws reorganizing the state program of assistance to veterans. The legislature established a permanent state division of veterans affairs in the executive department with an initial appropriation of $2,285,000. Provision was also made for a permanent state veterans service agency and for local veterans agencies throughout the state.

Other forms of state-local veterans administrations were created in Kansas, Minnesota, Oregon, and Wisconsin.

STATE VETERANS BENEFITS

The state legislatures, in 1945, extended many state laws previously enacted granting benefits and privileges to veterans, their dependents and organizations.

Such legislation included: (1) claims services, designed to assist all veterans in the prosecution of their claims against the United States Government; (2) hospital and domiciliary care of veterans and their dependents in state institutions; (3) economic grants to veterans and men in service and their eligible dependents to relieve or prevent want and distress; (4) employment preferences and preservation of job rights; (5) land settlement benefits; and (6) occupational and tax exemptions.

New legislation, enacted in 1945, comprehends: (1) bonuses paid to veterans or their legal heirs; (2) educational grants to eligible veterans to prevent want and distress when Federal or other benefit is inadequate to meet the veteran's need; (3) increased educational opportunities and training courses in state institutions; and (4) loans to qualified veterans for their rehabilitation, education, or for the purpose of aiding them in the purchase of homes, farms, or businesses.

THE MASSACHUSETTS DOCTRINE

Massachusetts took an approach on the veterans problem which has subsequently been characterized as the Massachusetts Doctrine. In the Report of the Post-war Rehabilitation Commission it is stated: "The problem of the veteran is not one of this minute, but will be a continuing process for years to come. The problem is, first, a responsibility of the Commonwealth and secondly, and perhaps more intimately, the problem of each local community." Among the laws enacted in Massachusetts were: a bonus to veterans of the Second World War; removal of disability of minority of veterans qualified under the G. I. Bill of Rights; a farm-aid bureau in the Department of Agriculture to assist veterans wishing to engage in farming.

MARYLAND AND MISSOURI

The Maryland legislature recommended that the Governor grant pardons to all parolees with an honorable discharge who served in the Second World War. Missouri will accept applications for bonuses to be paid veterans or their dependents, until Dec. 31, 1947, in the amount of $10 per month of service with a maximum payment of $250. New Hampshire also passed a veterans bonus bill.

SUMMARY OF STATE VETERAN LEGISLATION

Summarizing state veteran legislation as it has developed during the Second World War and as it has been extended from previous wars, the following benefits and privileges are available:

Bonuses.—Vermont, New Hampshire, Massachusetts, and Missouri have authorized the payment of bonuses, based generally on length of service and with maximum payments specified.

Burial Assistance.—Twenty-nine states have legislation for assistance in the burial of veterans of various wars. Such assistance is generally based on need. Indiana is the only state not requiring indigency as a prerequisite for the payment of burial expenses.

Institutional Care.—Twenty-four states maintain homes for needy veterans (often including veterans wives and widows). In seven states—California, Connecticut, Illinois, Michigan, Montana, Oklahoma, and Wisconsin—medical care on the premises of such homes is also provided.

Education.—Nineteen states have enacted legislation providing educational benefits for the orphaned children of veterans. Comprehensive educational benefits for veterans of the Second World War have been provided for in the G. I. Bill of Rights Act. Eleven states have, however, enacted supplementary educational opportunities—California, Illinois, Indiana, Massachusetts, Michigan, Montana, New York, Oklahoma, Oregon, South Dakota, and Texas.

Employment Preference.—Thirty-seven states have enacted legislation granting either civil service employment preference or favoring veterans for all public employment including public works projects. Among the special benefits provided by specific states: California, Connecticut, Illinois, Kansas, Massachusetts, Minnesota, North Carolina, Ohio, Rhode Island, and South Carolina extend civil service preference to veterans; Illinois, Michigan, Minnesota, Montana, New Hampshire, North Carolina, South Dakota, and Washington extend such preference in certain departments and on public works; 12 states interpreted existing laws as extending preference in all state employment.

Tax Exemption.—In 39 states, Second World War veterans are eligible for various kinds of tax or license fee exemption, either by reason of interpretation of existing law or through new legislative enactments. Tax exemptions vary among the states with respect to time limits. In some cases, notably property taxes, the exemptions are usually permanent. The most frequent exemptions for veterans are limited exemptions from state income and inheritance taxes, exemption of veterans from the property tax, exemption from personal and road taxes and from certain occupational and business license fees.

Loans and Land Settlement.—Owing to the broad loan provisions included in the G. I. Bill, the states have not entered into this field of veterans benefits with either the speed or the scope of their 1918-19 enactments. Four states have, up to this time, adopted measures designed to provide the veterans with land settlement benefits from farm and home loans. In California, veterans may draw from a revolving fund, known as the Veterans Farm and Home Building Fund, to acquire real estate not exceeding $10,000 in the case of a home, or $15,000 in the case of a farm. Amortization may be spread over a term of 40 years. In Oregon, a similar state fund has been created to advance money to resident veterans for the acquisition of homes and farms. South Dakota veterans, their dependents or survivors, may borrow a sum not exceeding $50 a month for 12 months to tide them over while government claims are being processed and adjudicated. New Jersey passed a law, before the adoption of the G. I. Bill, offering resident veterans $3,000 at low rates of interest to assist them in establishing themselves in business or profession. The state loan must be amortized, however, within six years.

EMPLOYMENT AND UNEMPLOYMENT

All 48 states have acted to stimulate private industry and to create jobs by establishing agencies on post-war reconstruction and development. In 1945, these agencies extended their blueprinting of specific public works projects within their jurisdictions; many were authorized by law to grant funds to local governments for the stimulation of plans and the drawing of specifications for local public works projects; most are engaged in some type of specialized state study on state resources and economic development.

The Alabama legislature authorized a study of the tax structure to equalize taxes and encourage private enterprise. Nebraska is also facilitating reconversion by lower tax rates. A complete industrial survey is underway in Oklahoma.

State aid to local planning and state participation in local public works and economic development programs, were considerably accelerated during 1945, further strengthening a two-year trend.

Tennessee, Alabama, Wisconsin, Virginia, Rhode Island, Michigan, and New York grant substantial state aid to local planning; states which provide direct local assistance, financially, to public works programs include New York, Michigan, California, New Jersey, Maryland, Illinois, and Pennsylvania. Many states, notably Arkansas, Georgia, and Louisiana gave staff assistance to the preparation of city and county capital improvement programs.

Two-thirds of California's planning budget goes to its community development programs, primarily for the purpose of creating new jobs. In New Jersey, the Department of Economic Development is working for the establishment in every community of a special development commission. Kansas emphasizes industrial promotion and advertising. New York, Pennsylvania, Massachusetts, and New Hampshire have for years provided business and industries with accurate information on economic trends, while continuing their larger programs of comprehensive state planning and development.

UNEMPLOYMENT COMPENSATION

In 1945, the states recognized their responsibilities not only for employment but also for providing, if necessary, for unemployment.

Maximum unemployment insurance benefits were increased by 25 states in 1945—Alabama, Connecticut, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, Texas, Utah, Vermont, Washington, and West Virginia.

Maximum duration benefits were lengthened by 28 states in 1945—Connecticut, Delaware, Illinois, Indiana, Iowa, Kansas, Maine, Maryland, Massachusetts, Minnesota, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Texas, Utah, Vermont, Washington, West Virginia, Wisconsin, and Wyoming.

Waiting periods between job dismissals and benefit payments were reduced in six states—California, Maryland, Nevada, New York, Oregon, and Pennsylvania. Maryland eliminated the waiting period entirely. Almost a third of the states extended the coverage of their unemployment compensation systems to include persons working for an employer of one or more, and the majority extended coverage to employers of eight or more.

As a result of this legislative action liberalizing unemployment compensation, the states provided against post-war unemployment, to the following extent: (1) weekly benefit maximums of $20 a week or more prevail in 27 states in which approximately 79 per cent of all covered workers in the nation are employed; (2) 13 states, including four which held no regular legislative session in 1945, have a weekly maximum of less than $18. However, less than 10 per cent of all covered workers are in these states; (3) maximum benefit duration of 20 or more weeks now prevails in 33 states in which 80 per cent of all covered workers are employed.

The financial condition of state unemployment compensation reserve funds has improved materially, and at the end of 1945, the total was nearly $7,000,000,000 as compared with less than $2,000,000,000 in 1941.

AVIATION

The anticipated heavy industrial expansion of aviation led a great majority of the states, in 1945, to prepare themselves for active participation. Specific recommendations for the establishment of state aviation commissions, air codes, and air zoning laws, and for the general improvement of aviation facilities, as made by the governors of most of the 44 states having legislatures in regular session in 1945, were incorporated into law.

The total number of states with administrative agencies to deal exclusively with aviation matters was raised to 39, in 1945. Enabling legislation was passed in most states to permit states and localities to participate in a Federal-state airport construction program.

Authorization for municipalities to own, construct, or operate airports was given by six states in 1945—Pennsylvania, Nebraska, Washington, Arkansas, Minnesota, and Florida. Nebraska's is typical of many of these laws in that it gives municipalities the right to acquire, construct, maintain, and operate airports and other air navigation facilities and to issue bonds and levy taxes for their support.

Technical services for airport development will be provided municipalities in Montana and West Virginia, in the former through a newly created state aviation commission.

The North Carolina, as well as the Nebraska law, provides clear authority for municipalities to exercise the power of eminent domain in condemning land for the construction of airports and landing strips.

Minnesota enacted one of the most comprehensive state aviation codes, during its legislative session of 1945.

Twelve states passed zoning laws governing the construction and location of structures within airport hazard areas—Florida, Illinois, Iowa, Nebraska, New York, North Carolina, Oklahoma, Pennsylvania, Tennessee, Utah, Washington, and Wisconsin.

A majority of these laws took the form of the Iowa legislation which allows political subdivisions to adopt airport zoning regulations to limit the heights of nearby structures and to eliminate other hazards.

HIGHWAYS

A large volume of legislation affecting highway construction was enacted by the state legislatures, in 1945. California, Indiana, New Jersey, and New York enacted important measures with respect to limited access highways, and many legislatures supplemented previous highway legislation to enable their states to participate fully in the Federal-aid highway act of 1944.

HOUSING, HEALTH, EDUCATION, WELFARE

While the legislative-administrative emphasis among the state governments in 1945 was placed upon the returning veteran and state programs designed to bridge the gap from war to a peacetime economy, many states prepared the way during 1945 for extending their governmental activity in housing and the social services.

Arkansas, California, Colorado, Connecticut, Florida, Illinois, Indiana, Minnesota, New York, Pennsylvania, and Tennessee enacted legislation, in 1945, to eliminate blighted areas and to assemble land public housing projects. The new California urban redevelopment law permits cities to condemn blighted areas by eminent domain and to secure their rebuilding by private enterprise according to plans developed by the city. Pennsylvania cities were authorized to create redevelopment authorities and to establish housing projects. Minnesota legislation provided for the eradication of slum areas through the formation of neighborhood redevelopment corporations. Private agencies, including insurance companies, are authorized to acquire through condemnation proceedings land necessary to undertake a project after 60 per cent of the property concerned has been purchased.

Housing legislation was enacted by California, Georgia, Illinois, Nevada, New York, Pennsylvania, Tennessee, and Washington. Illinois and Pennsylvania authorized insurance companies to invest up to ten per cent of their assets in housing either by the direct operation of housing projects or through loans to housing agencies.

HEALTH

The health needs of the nation were brought sharply into focus during the war years by the high level of Selective Service rejections. The states, during the year, further developed the trend of 1943-1944 in re-examining and re-evaluating their public health programs. Governors and legislatures in state after state set specially constituted commissions to work surveying existing facilities and services, assessing post-war problems, and developing legislative-administrative programs for meeting them.

During 1945, new health laws were enacted in most of the states; many old laws were tightened and extended. In some cases, state health departments were completely reorganized, expanded, and placed upon firmer footings.

Maine, North Carolina, Kansas, and Wyoming were among the states which completed or initiated surveys of their medical care needs and prepared programs for future expansion.

Rhode Island inaugurated, in 1945, what is described as the first program in the United States for compulsory insurance to cover cash sickness compensation for wage earners. During the same period, North Carolina extended the coverage of the local units of its State Health Department to 95 per cent of the total population. In Kentucky, new health units brought

90 per cent of the population under full-time health services.

In addition to the reorganizations of state health departments proposed legislatively in Colorado and effected in Illinois, South Dakota, California, and Washington, organization of new cooperative agencies at the county and city level, with the states providing administrative liaison and financing, continued in many states of the Union.

WELFARE

Under the Social Security programs, old age assistance and aid to dependent children were increased by more than a dozen states, during the 1945 legislative year.

Old age assistance may be increased in Arkansas, Delaware, Michigan, Minnesota, Wyoming, Texas, Utah, Vermont, Colorado, and Washington. Aged persons in Delaware now may receive $30 monthly under legislation raising the maximum to that figure from $25 per month. Wyoming raised its maximum to $50 a month; Utah increased maximum benefits from $30 to $40; Washington put old age assistance on the basis of need and provided $50 minimum for persons over 65 who have no other income. Vermont raised maximum old age benefits from $30 to $40 for individuals and from $45 to $60 for couples.

Allotments for dependent children may be increased in New York, Iowa, South Dakota, Nebraska, and Minnesota. New York extended its aid to the dependent children program, placing aid on a basis of need. Aid will be given to the parent or other relative of a child under 16 or of a minor between 16 and 18 if the help is judged necessary. Iowa has increased the minimum aid to dependent children from $15 to $18 a month for the first child in a family, from $10 to $12 a month for each additional child, and from $50 to $75 a month per family.

Some 1,200 families benefited almost immediately from increased aid to dependent children voted by the South Dakota legislature in 1945. Maximum aid was boosted from $18 to $30 a month for the first child with payments for additional children remaining at $12. Need, rather than the present $18 a month ceiling, will govern maximum assistance to dependent children in Nebraska. Colorado also placed aid to dependent children on the basis of need, eliminating the ceiling.

ANTI-DISCRIMINATION LAWS

Laws designed to prevent discrimination in employment because of race, color, creed, or national origin were passed in New York, New Jersey, and Indiana during 1945. New Jersey and Utah also enacted more general anti-discriminatory legislation; in New Jersey, a series of six laws was passed banning racial and religious discrimination in schools, municipal hospitals, hotels, and places of amusement.

New York led the country in establishing the first state fair employment practices commission, designed to prevent an employer for refusing to hire, or to discharge, or to discriminate against any individual with regards to terms of employment or compensation because of race, color, creed, or national origin. The law also prohibits exclusion, expulsion, or discrimination by a labor organization against any individual for these reasons. For an employer or employment agency to make any inquiry in connection with prospective employment which bears directly or indirectly on matters of race, color, or national origin is also outlawed.

Complaints of violation will be received and investigated by the commission of five set up by the law. The commission may issue cease and desist orders. If such orders are not complied with, it may appeal to the Supreme Court for an order requiring obedience, a violation of which may be punished as contempt of court.

The Indiana law declares the right of opportunity to obtain employment without discrimination because of race, color, creed, national origin, or ancestry. It authorizes the commissioner of labor to make studies of discrimination and to recommend to the general assembly plans and legislation for its elimination.

Other anti-discrimination bills were passed by the state legislatures during 1945; an Iowa bill extends the law prohibiting discrimination against men in military uniform to women in military uniform; a Maryland bill equalizes salaries of Negro school supervisors.

STATE FINANCE AND TAXATION

The past five years have been "Golden Years" for most state treasuries: total state revenues rose from $3,300,000,000 in the fiscal year 1940, to $4,100,000,000 in the fiscal year ended June 30, 1945, with these figures excluding unemployment compensation contributions.

State income taxes, especially those on corporations, and general sales taxes provided the lion's share of the 24.2 per cent increase. Total state tax collections would have increased even more if commodity shortages and rationing had not brought about declines in revenue from several important revenue sources, especially motor vehicle fuel taxes and related license fees.

Nineteen of the 34 states which tax personal or corporation income altered their tax laws during the 1945 legislative sessions.

Personal income tax reductions were extended by two states, New York and California, and a tax increase was extended by the Commonwealth of Massachusetts. New York extended the 25 per cent reduction on personal incomes and net capital gains. The reduction in personal income tax rates enacted in California in 1943 was extended for another two years. Massachusetts extended through 1948 the ten per cent additional income tax.

Six states granted additional tax deductions under the terms of new legislation — Colorado, New York, North Dakota, North Carolina, Oregon, and South Carolina.

Corporation taxes were extended by New York and Pennsylvania. New York extended the 6 per cent business corporation franchise tax to April 30, 1947. Pennsylvania extended the 15 per cent credit on the amount of corporation income taxes to be paid for years beginning before Jan. 1, 1947.

A tax was levied on the net income of buildings and loan and savings and loan associations by Arizona. The tax rate of 5 per cent applies to income including interest on bonds and other securities issued by the Federal Government, the state, or any political subdivision.

Refund of corporation taxes where losses are incurred through contract renegotiation by the Federal Government is allowed by Oregon and Maryland. Pennsylvania imposed a 4 per cent net income tax on cooperative agricultural associations for the privilege of doing business or having capital stock or property employed in the state.

Revenue collections from state sales, gas, and tobacco taxes—three principal sources of state income—swung upward considerably during 1945.

A tendency toward new or higher taxes appeared to prevail, during 1945, with regard to excises. Motor fuel taxes were increased in three states—Idaho, Iowa, and Oklahoma; cigarette taxes were adopted in Idaho, and subject to a referendum in Oregon. Indiana and Utah increased their beer taxes, while Oklahoma raised its soft drink tax.

CONCLUSION

Early in the war, an extensive state tax and fiscal policy program was urged upon the states by their joint agency, the Council of State Governments. This program proposed that the states adopt a tax and fiscal program that would enable them to do their full part in solving the problems that were sure to confront the country after the war.

It was recommended that the states maintain tax rates at existing levels; that every effort be made to conduct the operations of state governments during the war years in the most efficient and economical manner; that state debt be retired as rapidly as possible; that state surpluses be allowed to accumulate in order to enable the states to initiate reconstruction projects and for the preservation of these surpluses by investment in government bonds, thereby contributing also to the campaign against inflation.

This program was widely accepted by the state governments with the result that the states are in a better financial condition today than at any other time during the past half-century. During the war years they reduced their gross indebtedness by more than 26 per cent; the states and their localities have surplus funds totaling in excess of $5,500,000,000; many of the states have improved their tax systems and have greatly expanded and improved budget administration and methods of financial control.

The states, as a whole, are prepared, legislatively, administratively, and financially, for the period of post-war reconstruction and development.

NATIONAL AND INTERSTATE RELATIONS OF THE STATES

By Frederick L. Zimmermann
Research Director, New York Joint Legislative Committee on Interstate Cooperation

---

TRENDS IN FEDERAL-STATE RELATIONS

Perhaps it is symbolic that Federal agencies, during the depression period, at times lobbied in state capitols for the enactment of state legislation which they deemed desirable, whereas the states are now active at Washington in seeking to shape Federal legislation which affects the role of state governments. This article in previous years has pointed out that certain salient features have characterized the recent trend of Federal-state relations in the United States. These will be briefly summarized here.

In the first place, the United States Supreme Court has tended to retreat from its traditional role as the umpire of the Federal system in that the trend of judicial interpretation of the Constitution has been toward the elimination of any broad constitutional check upon the extension of the functions of the National Government. Second, Congress has increasingly become the forum for the determination of the relative roles of the nation and the states.

In the third place, the state governments, made aware by the pressure for centralization and better organized as a result of the interstate movement of recent years, have, through the Council of State Governments and a more effective Governors' Conference, turned to Congress to present their case. Moreover, those organizations have become steadily more effective as media for presenting the position of the states at the nation's capitol with the Council now maintaining an office at Washington and through its *Legislative Bulletin* informing state officials of Federal legislation which affects the states.

Fourth, the Council's policy in Federal-state relations has been in large part to seek the fashioning of a cooperative pattern as between all levels of government and to channel the administration of new programs through the extant machinery of government-Federal, state and local, thus avoiding that establishment of new governmental organizations parallel to the extant structure which complete centralization of any activity usually entails.

Fifth, while the tendency toward cooperative federalism was already apparent in the United States along with the marked trend toward centralization, the activities in recent years of the Council of State Governments have served to emphasize the tendency toward cooperative government.

Sixth, as a concomitant of the Council's activities in Federal-state relations and hastened to some degree by the needs of the war period, new and more institutionalized channels of Federal-state relationships have been developed.

FEDERAL-STATE ISSUES BEFORE CONGRESS

There are many issues before the present Congress which are of importance to the states. It is notable that, like its predecessor, this Congress in the determination of many of these contested issues generally favored what might be called the states' point of view. This does not mean, of course, that the issue in any instance was confined to the question of the relative role of the national and state governments. Some interests and pressure groups, for reasons and purposes of their own, favored the state viewpoint just as other interests and pressure groups favored complete Federal administration. Nor does the fact that the states in some instances pressed their position on certain issues mean that there will be a constant and damaging conflict between the states and the National Government as to the division of functions in the Federal system. Rather, the determination of these issues may represent the growing pains of a more cooperative federalism.

STATE ADMINISTRATION OF UNEMPLOYMENT INSURANCE

One of the most noteworthy storms in the 1945 session of Congress revolved about proposals with respect to unemployment insurance which state administrators felt would impair state control of administration in that field. Since the enactment of the Federal Social Security Act of 1935, insurance against unemployment has been a joint Federal-state responsibility.

The federalization of unemployment insurance has long been urged by proponents of centralization, and legislation to that end has been introduced in Congress. The states on their side have been adamant that unemployment insurance continue under state administration in a Federal-state cooperative pattern. The states, in the past decade, have expanded and extended their employment security systems beyond the area of Federal assistance. The Federal-state unemployment compensation system, provided by the Social Security Act of 1935, has also been expanded and extended, primarily on the initiative of the states.

President Truman's proposal for supplementary Federal emergency benefit payments to insure minimum standards for the weekly rate and duration of unemployment benefits ran into serious opposition in Congress and has not been enacted. In view of the tempest these proposals evoked, it seems unlikely that Congress will consider the major step of federalization in the immediate future.

In the meantime, on the recommendation of the Council of State Governments, the states, in the 1945 legislative sessions, extended and improved their systems of unemployment compensation. Even the Social Security Board, long an advocate of federalization in this field, recognized the progress made by the states. The *Social Security Bulletin* of July 1945 commended the action of the state legislative sessions of that year.

Similarly, the Congress has favored the states' position in the battle over the date when the employment offices should be returned to the states, even to the extent of attaching a rider to an appropriation bill which was then vetoed by the President. These employment offices were loaned by the states to the National Government during the war period on the request of the President with the understanding that, at the proper time, the employment offices would be returned to the states. The Governors' Conference has for some time been concerned with the return of these offices, and in its 1945 meeting urged their immediate return. The President has urged that the Federal Government retain the employment service during the emergency period of transition from war to peace. The battle is still raging but it seems probable that in any event the employment services will eventually be returned to the states. One of the principal arguments used against the states is that, under state administration, there is no provision for integration of the employment services of the various states.

Nor did Congress provide for Federal coverage with respect to unemployment insurance of maritime workers. In fact, the states, through the Interstate Conference of State Employment Security Agencies, have in the meantime been effectuating state coverage of these workers. The interstate reciprocal agreement relative to the coverage of maritime workers has now been signed by Alabama, Virginia, California, Nebraska, and New York. A separate agreement has been established for the Great Lakes states to cover maritime employment on those waters.

SUBMERGED COASTAL LANDS

A bitter battle in an atmosphere of charges and counter-charges has been waging with respect to the ownership of submerged coastal lands following the assertion by Federal officials that the Federal Government has title to such lands. The states claim that a long line of Supreme Court decisions have upheld their title to these submerged lands. The Federal Government asserts that none of these cases rested on the specific issue of ownership. The Attorney-General of the United States has filed against California on this issue, with the result that 46 states oppose the Federal claims. The battle was carried to Congress where the House of Representatives passed legislation which would give the states clear title to land from the high water mark to a line three miles at sea. This legislation is now pending in the Senate.

INSURANCE

In the *United States vs. Southeastern Underwriters Association*, the Supreme Court departed from its long line of decisions, going back to 1868, to the effect that insurance was not commerce. The Court in this case held that insurance was commerce and thereby opened the insurance field to regulation by the Federal Government. The decision immediately raised the question for the states as to what extent state regulation and taxation of insurance was affected by certain existing Federal laws based on the commerce clause, notably the anti-trust laws.

It is significant that, under the leadership of the National Association of Insurance Commissioners, the states turned to Congress to seek legislation that would preserve the extant state system of regulation. In response to this request, Congress, early in 1945, enacted legislation, which was signed by the President, "to express the intent of Congress with respect to regulation of the insurance business." The congressional conference committee in its report stated it was the intent of the legislation "that a moratorium be granted to the insurance business from the operation of the Sherman Act, the Clayton Act, the Federal Trade Commission Act, and the Robinson-Patman Anti-Discrimination Act until January 1, 1948, leaving the taxing and regulatory powers of the several states fully protected."

The act provides: "No act of Congress shall be construed to invalidate, impair, or supersede any law enacted by any state for the purpose of regulating the business of insurance, or which imposes a fee or tax upon such business, unless such act specifically relates to the business of insurance . . ." After Jan. 1, 1948, the Federal laws mentioned above shall be applicable to the business of insurance to the extent that such business is not regulated by state law. The states are now seeking to expand and perfect their regulation of insurance, with committees of the Council of State Governments, the state Attorneys-General, and the National Association of Insurance Commissioners working on the subject.

WATER RESOURCES

The decisions of the Supreme Court in the Red River and New River cases some years ago seemingly left few constitutional limits to the power of the Federal Government with respect to the regulation of streams. Flood control proposals, which seemed to open the way for complete Federal control of waterways, met with state pressure in the Congress with the result that the 1944 Flood Control Act and the 1945 Rivers and Harbors Act were amended to recognize state interests. The amendment is in effect a declaration that the policy of Congress respecting the interests and rights of the states and their interests in water utilization and control shall be recognized, preserved, and protected, that the plans of interested Federal agencies for water resources development shall be integrated, and that the states through appropriate state agencies, designated by their respective governors, shall be consulted and given an opportunity to have their comments submitted to Congress in the formulation of any plan of a Federal agency for river basin development.

Similarly, legislative proposals before the Congress for Federal action in the abatement of pollution have made little headway. In order to formulate a definite program of state action with respect to water resources, the Council early in 1945 established a Committee on Water Resources. The committee tentatively recommended that future Federal legislation in this field should incorporate principles similar to those set forth in the 1944 Flood Control Act and the 1945 Rivers and Harbors Act, that the integrity of state water laws and freedom of compact should be preserved and maintained, and that the states should prepare now to carry out their responsibilities under such a national policy.

Meanwhile, an inter-agency committee has been set up in the National Government. The Council's Committee is now studying the question of the advisability of legislation creating a permanent Federal inter-agency committee, with appropriate non-Federal participation, to exercise full responsibility for coordinating the Federal water development programs, and to cooperate with state and interstate agencies. It is noteworthy that the states are now formulating a program of state action to meet the water resources problem. In this connection, it is significant that Pennsylvania, in 1945, enacted a broad program of legislation for pollution abatement.

AVIATION

There was wide adoption by the states during the year of the recommendations of the Council of State Governments with respect to aviation in the form of measures to establish state aviation agencies, provide for airport zoning, and in those states where it was needed, amend condemnation procedures in relation to airports. In view of state action, it seems that the states will have a larger share of the regulation of aviation than had been at first envisaged, although it is self-evident that the major share of regulation will be national in character.

The major issue before the Congress with respect to Federal-state relations in this field is the determination of the question as to whether the Federal grants-in-aid for airports shall be channelled through the state governments in accordance with the established pattern of previous national grants-in-aid or the Civil Aeronautics Administration shall be empowered to deal directly with local governments in the development of a national airport system. On one side of this issue is the Council of State Governments, on the other side is the National Conference of Mayors. In the congressional tug of war, the Senate enacted a measure which embodied the state viewpoint in that it provided for national-state cooperation in the development of a system of airports; the House enacted provisions for direct Federal-local cooperation but only after a long drawn out fight and a very close vote in the defeat of an amendment favored by the states. The two bills are now in conference committee.

The decision with respect to airports is extremely important in itself but even more important is the principle involved, since it may have a profound effect on American intergovernmental relations in many other fields of activity. The principle once accepted might also be applied in possible future Federal grants-in-aid for public works, health and hospitals, and education.

OTHER FEDERAL-STATE ISSUES

There are some other Federal-state issues of which brief mention should be made. It would seem probable that the Federal-state National Guard system is to be retained. The Council of State Governments and the National Association of Attorneys-General secured the passage of legislation in Congress to require the Office of Defense Transportation to pay taxes on truck lines taken over by the Federal government.

Congressional legislation providing for Federal intervention in the field of forestry regulation made little headway. The Council's Committee on Forestry in an effort to initiate a state program recommended to the states among other things that they expand state forest holdings and that the states enact legislation for the regulation of cutting practices on private lands. Maryland, Massachusetts, and California have enacted the model regulatory legislation recommended, while Washington and Oregon have enacted somewhat similar measures. New York is working on a cooperative forestry practices act, while some states are expanding their state ownership of forest lands and their reforestation programs.

That the state governments will be interested in projects of international organization which may affect their functions is indicated by the Interstate Oil Compact Commission's opposition to the original proposal for an Anglo-American oil treaty, the current negotiation with the Great Lakes states relative to the Great Lakes Fisheries Treaty, and the action of the Atlantic States Marine Fisheries Commission in insisting that the states should be consulted in such matters. It is interesting to note that the establishment of a United Nations Organization site will probably require action by the state in which the headquarters are located.

THE STATES AND THE STRATEGY OF INTERGOVERNMENTAL RELATIONS

As has been pointed out in previous issues, the position of the states in the Federal system was not weakened but probably strengthened during the war period. In addition, the states are in the strongest financial position they have attained in the last 50 years. The Executive Director of the Council, reporting to the Board of Managers in November 1945, points out that "during the war years they (the states) have reduced their gross indebtedness by 25 per cent and the states and their localities have surplus funds totaling approximately $5,000,000,000. In addition, many states have improved their tax systems and have greatly expanded methods of budget administration and control." It has long been pointed out that expansion of activities of the National Government did not bring a contraction of state government but, rather, expansion at the national level paralleled by a growth of the functions and activities of the state governments.

CHANNELS OF NATIONAL-STATE COOPERATION

One of the notable accomplishments of the defense and war cooperation between the national and state governments was the establishment of a channel of communication between the two levels of government to implement cooperative action. This long-needed cooperative machinery has been developed over the past five years by the Council of State Governments and the U. S. Department of Justice through its Federal-State Relations Section. The procedure established has proven very effective. The Federal-State Relations Section receives proposals which Federal agencies wish to call to the attention of the states. These proposals are considered by the Council's Drafting Committee of State Officials which may ultimately clear them for recommendation to the states by the Council of State Governments. The Council of State Governments receives from its special study committees state proposals requiring cooperation by Federal administrative agencies and transmits them to the Federal-State Relations Section of the Department of Justice for reference to the appropriate Federal agencies.

The Chief of the Federal-State Relations Section states that the 1945 program of recommended state legislation, consisting of 22 proposals arising from both state and Federal levels, "received from the states perhaps the most favorable consideration given to these programs since their initiation in August, 1940." The measures recommended in 1945 included five acts relating to the protection of the armed forces and their property, legislation relating to the enrichment of white bread and flour, and the Airport Zoning and Condemnation Acts, the Second Injury Fund Act, designed to facilitate the employment of returning veterans and other disabled persons in the light of state workmen's compensation laws, the State Veterans' Service Officer Act, the Purchase of Federal Surpluses Act, a State Plane Coordinates Act, and others. In addition, there were several more general recommendations relating to child labor, crippled children, and food, drug, and cosmetic legislation. A State Aeronautics Department Act was developed outside the regular program by Federal and state officials working through the Council of State Governments and the Federal-State Relations Section. In almost every instance these proposals were enacted by a number of states.

The program for 1946-47 adds to previous recommendations three acts relating to the inspection and marketing of agricultural products which came out of conferences on this subject called by the Council, a Harmless Flight of Aircraft Act, and others. In addition, there were a number of more general recommendations for the improvement of state soldier voting laws and state adoption laws. One significant general recommendation of the Board of Managers of the Council of State Governments urged that, in the interest of the development of state responsibilities, the states rely as little as possible on the Federal government for financial assistance. Another important recommendation was that the legislatures of the several states review all war emergency legislation in order to determine which measures should be continued on a permanent basis, which should be adopted for use in a future emergency of some kind, and which should be repealed. State officials have found that many of these measures have a peacetime utility.

Intergovernmental cooperation in the United States reached a new high during the recent war. In contrast to the spasmodic and unorganized development of state war legislation in the First World War, the cooperative machinery described above made possible uniform enactment of specific proposals. It is notable that the recent Federal-state programs of recommended legislation include many measures for permanent peacetime state regulation and administration. There seems to be no doubt that the machinery that has operated so effectively during the war period will not be abandoned in the peace. Indeed it is more likely that it will develop further and that it may eventually include a link of some kind to Congress. Nor are the Federal-state cooperative efforts limited to legislation. The Council is working closely with the Veterans Administration to coordinate Federal and state activities, and a committee of state purchasing officers is developing procedures and methods of operation which will enable the states to fill their needs from Federal surplus property. If the cooperation of wartime is continued in the peacetime relations of the two levels of government, further progress will be made towards a cooperative federalism.

DEVELOPMENT OF INTERSTATE COOPERATION

It seems clearly evident that the progress which is being made towards a new and more closely integrated pattern of intergovernmental relationships in the United States has received a major impetus from the existence and the activities of the Council of State Governments. This machinery of interstate cooperation, as established by the parent American Legislators Association in 1935 has as its basic units, the state Commissions on Interstate Cooperation, the official negotiating agencies of their respective governments in National-state and interstate relations. Generally, these bodies follow the pattern originally envisaged in that their membership includes representatives of both houses of the legislature and of the executive branch in order to secure integration within the state government in its negotiations with other governments. Limited at first principally to the states of the Northeast, the use of such agencies spread gradually to other states, until in 1945, 46 states had established cooperation commissions. Idaho and North Dakota, the two remaining states, are cooperating with the Council through the medium of committees appointed by their Governors.

The Council has become completely self-supporting with appropriations from every one of the 48 states and is now expanding its facilities to meet the increasing demands upon it. It recently agreed to act as the secretariat for the new association of state budget officers. While the original plans of the Council laid emphasis upon regional offices and the regional office in New York has amply demonstrated the value of such agencies, the tendency in the future may very well be to work from the present offices in Chicago, New York, Washington, and San Francisco, with a possible additional office to serve the South, instead of a complete system of regional offices.

INTERSTATE COMPACTS

There were some noteworthy developments in the use of interstate compacts during 1945. State participation in some of the more important compacts was enlarged. Montana, Florida, West Virginia, and Alabama joined the Interstate Oil Compact to make a total of 17 states that have ratified that instrument. Connecticut and Florida ratified the Atlantic States Marine Fisheries Compact, leaving North Carolina as the only state of the 15 Atlantic Coast states that has not entered the agreement. Oklahoma became the 39th state to ratify the Interstate Parolee Compact, which has been ratified by the largest number of states of any compact in the history of the Union.

This compact has successfully met a long-felt need for effective control over probationers and parolees as they move from one state to another either before or during their terms of supervision. However, in the years since it was adopted questions of application have arisen, and a need for a degree of uniformity in interpretation and administration has manifested itself. Under the terms of the compact the Governor is called upon to appoint an official administrator whose duty it is to administer the compact for the states. These official administrators recently formed the Interstate Compact Administrators Association. A committee of that body will act as a clearing house for all matters that may arise, and in order to secure uniformity in procedure and practice shall advise administrators of the committee's interpretation or opinion respecting any point in question. The committee will consider changes or additions to existing rules, regulations and forms with respect to the administration of the compact, and upon ratification by three-fifths of the compacting states shall put such changes into effect. This is an interesting development in that it is an organized interstate effort through state administrators to improve the operation of an interstate compact improving administrative practices as to its subject matter.

One of the criticisms usually made of the compact method is that a compact is difficult to amend because of the necessity of action by the legislatures of the participating states and ratification by the Congress and accordingly tends to be inflexible. It is significant that in 1945 two compacts were amended seemingly with no difficulty. New York and Vermont amended their compact with respect to the Lake Champlain Bridge Commission, while Ohio and Pennsylvania amended the Pymatuning Lake Compact of 1937.

Similarly, there would seem to be some doubt as to the validity of the argument that legislatures are adverse to entering into these agreements because they are more binding than an ordinary statute. For some years, Pennsylvania had refused to ratify the Ohio River Compact and the Potomac River Basin Compact which are interstate compacts for the abatement of pollution in those rivers. However, at the same time, Pennsylvania refused to enact legislation for the control of pollution in the Delaware analogous to that passed in the other Delaware River states. In 1945 Pennsylvania enacted both the statute and the two compacts when the legislature reversed its previous position on pollution legislation and enacted a broad program of abatement measures. This would seem to indicate that objection to subject matter is more important than objection as to the method involved.

With the adherence of Pennsylvania, state membership in the Potomac River Basin Compact is complete. While with ratification by Pennsylvania a sufficient number of states have now ratified the Ohio River Compact to put that instrument into effect, several states conditioned their ratification upon that of Virginia. At the present time it does not seem likely that Virginia will ratify during her 1946 legislative session. This is extremely unfortunate since Virginia contains less than three per cent of the land in the basin and is reputed to have been included in the original group of participating states for the sake of securing complete adherence rather than because Virginia pollution constituted a real problem for the basin. It may be necessary to secure a withdrawal of the condition of Virginia ratification by the stipulating states in order to consummate this long delayed compact.

FISHERIES

One of the most noteworthy compacts of recent years is the Atlantic States Marine Fisheries Compact, ratified by 14 coastal states, which established the Atlantic States Marine Fisheries Commission comprised of three representatives from each compacting state. This body, authorized to recommend measures for the preservation of the fisheries to the governments of the cooperating states, has operated in practice chiefly through the medium of regional panels. Since its establishment the Commission has made considerable progress with respect to its uniform acts relative to certain species of fish and particularly in securing the establishment by participating states of adequate systems of state catch statistics. It has also been instrumental in studying and formulating programs for better sanitation in the fisheries industry and for more intensive conservation education with emphasis on the fisheries in the coastal states.

During 1945, the Commission sought to solve several of the outstanding and historically rooted interstate fishery disputes on the Eastern seaboard. Maryland and Virginia have for years been warring over the blue crab of the Chesapeake and the oysters of the Potomac. Negotiations conducted by the Commission with respect to the blue crab failed to make much progress in the face of an almost complete break-down by the fishery biologists of all previous recommendations of those biologists. Under the historic compact of 1785 only concurrent statutes of the two states as to Potomac fisheries have validity. Maryland has for some years refused to concur in laws of Virginia which Maryland viewed as destructive of the oyster fisheries of the river with the result that enforcement of those provisions which were concurred in has been difficult and ineffective. In 1945 the situation became so acute that the governors of the two states sought to find a way out of the controversy. Maryland passed legislation to appoint a commission to revise the Compact of 1785 but commissioners had not been appointed as the year closed, nor had Virginia acted on the proposal.

In the meantime it is indicated that the representatives of the two states on the Atlantic States Marine Fisheries Commission have agreed on a proposal that would establish a joint state authority to govern the oyster fisheries of the Potomac either by amendment of the compact of 1785 or through concurrent legislation by the two states under the authority of that compact. This agreement is, in itself, a notable achievement in view of the long history of the dispute and the virulence of local feeling.

INTERSTATE COMMISSIONS

With the addition of the four new states that ratified the Interstate Oil Compact in 1945, the 17 member states of the Interstate Oil Compact Commission now account for 80 per cent of the oil and 90 per cent of the natural gas production of the nation. While the Compact Commission has no power to pass, or to compel any state to pass conservation laws, it is notable that, since its adoption in 1935, state laws for the conservation of oil and natural gas have steadily improved and increased. In 1945, Alabama, Florida, North Carolina, and Georgia enacted effective conservation laws based on the recommendations of the Interstate Oil Compact Commission, while Oklahoma improved its laws by two important amendments.

The Interstate Sanitation Commission, created by compact among the states of New York, New Jersey, and Connecticut, continues to make progress in the abatement of the pollution problems of New York Harbor and adjacent waters. The Interstate Commission on the Potomac River Basin, established by Maryland, Virginia, West Virginia, Pennsylvania, and the District of Columbia, is formulating plans for the zoning of the Potomac River Basin into its areas of principal water use and establishing standards of quality for the waters in those areas.

STATE CONSTITUTIONS, REFERENDA, AND INITIATIVES

By Edwin O. Stene

Associate Professor, University of Kansas

GENERAL

The year 1945 was an off-year for elections; hence there were relatively few constitutional and statutory changes by popular vote. Not since 1939, however, had as many states experienced direct popular participation in law making during years between congressional elections. Twelve states voted on new constitutions, on constitutional amendments, and on legislative measures during the year. On the other hand, the number of questions voted on was the smallest in 14 years. This drop can be explained by the fact that Georgia, which accounted for more than half of the constitutional amendments in previous odd numbered years, voted this year on but one question: a new constitution.

REVISED CONSTITUTION IN MISSOURI

Two states adopted new constitutions in 1945. The revisions were, in the main, conservative. Yet the experiences of Missouri and Georgia provide an affirmative answer to the question of whether general constitutional revision can be successfully accomplished.

In 1942, under a constitutional provision for a vote on the question every 20 years, the people of Missouri called for a constitutional convention. Delegates were elected in 1943, and the convention completed its work late in 1944. At a special election on Feb. 27, 1945, the new constitution was adopted by a vote of almost two to one.

The bicameral legislature was retained, despite the fact that the advocates of unicameralism had played an important part in calling for the convention. However, new provisions were made for the apportionment of legislative seats, and safeguards were provided against invisible government by committees. Hereafter committees are required to keep public records of votes on all bills before them, and one-third of the members of either house have authority to take a bill from a committee to the floor. In addition the legislative research committee was given constitutional status.

Administrative consolidation is a major feature of the new Missouri constitution. Fourteen departments under the governor will replace 72 agencies that had been established under the old constitution. A single revenue department replaces nine tax assessment and collecting agencies, and a state director of education selected by a bipartisan board of education will replace the elected state superintendent of schools. A combined department of public health and welfare is a somewhat novel consolidation.

The non-partisan court plan, which had been established by popular initiative in 1940 and retained over legislative opposition in 1942, is retained. Under this plan the judges are appointed originally by the governor, but they must stand for re-election by non-competitive vote at the expiration of each term. Another change in the judicial department provides for magistrate courts in place of justices of peace. The magistrates and probate judges must be lawyers. Also the state supreme court is empowered to make rules of practice and procedure for all courts of the state, and to transfer judges temporarily from one court to another.

The uniform general property tax has been abolished. For tax purposes, property in Missouri will be classified hereafter into three categories: real property, tangible personal property, and intangible personal property. In addition, the legislature is authorized to encourage reforestation of rural lands not suited for farming and reconstruction of blighted areas in cities by granting tax relief for a period of not more than 25 years.

The right to draw up and adopt home rule charters has been extended to all cities of 10,000 population or more, and also to counties with populations in excess of 85,000. The general assembly is directed to divide counties into no more than four classes. Alternative forms of government may be provided for the counties of any particular class, but no laws may be enacted which are not applicable to all counties of a class.

The new constitution of Missouri is about 11,000 words shorter than the one which it replaced. Yet it is considerably longer than the Model State Constitution drawn up by a committee of the National Municipal League.

REVISED CONSTITUTION IN GEORGIA

The constitution adopted by the people of Georgia on Aug. 7, 1945 is the eighth in the state's history. A primary object of this latest revision was to avoid the necessity of enacting local legislation by constitutional amendment. As mentioned above, Georgia has accounted for more than half of the state questions voted on in recent odd numbered years. In that state alone 26 constitutional amendments were submitted to the electorate in 1937, 33 in 1939, 70 in 1941, and 28 in 1943. A large majority of those amendments were local in character.

By the new constitution, home rule is provided for cities and counties. These units of local government are permitted to make zoning regulations and to issue bonds within specified limits when authorized by local elections. The legislature is empowered to provide methods for the merging of county and city governments.

Unlike the Missouri constitution, that of Georgia makes no provision for administrative consolidation. Instead, the existing constitutional offices were retained, including the fish and game commission, the commissioner of agriculture, and the commissioner of labor, all of which had been given constitutional status in 1943. In addition, a veteran's service office was created. An effective budget system was established, however.

On the political side, on the other hand, a number of progressive steps were taken. The poll tax was eliminated as a prerequisite for voting, as were also certain other discriminatory suffrage provisions. The 18 year voting age was retained. Special tax exemption for favored corporations are no longer permitted.

Other changes in Georgia include an increase in the membership of the state supreme court from six to seven in order to avoid deadlocks, and the establishment of an office of lieutenant governor.

CONSTITUTIONAL AMENDMENTS

Twenty-one constitutional amendments were adopted by popular vote in seven states, whereas three proposed amendments were defeated. In addition an amendment to exempt war veterans from the poll tax requirement for voting for a period of three years after the war, was adopted by a constitutional convention in Virginia without subsequent popular vote. The call for the convention had been approved by popular vote, however. Three amendments proposed by the Connecticut legislature were submitted to the town meetings and may not be voted on in all communities of the state until 1947. Of the 169 towns, 148 had voted on the amendments in 1945.

LEGISLATIVE

Proposals to increase the compensation of legislators again came before the people in two states, but, as in past years, these proposals met with considerable opposition. The voters of Texas refused to grant an increase in legislative pay. The other pay-increase proposal, an amendment to increase the compensation of Connecticut legislators from $300 to $600 a term, still awaits consideration in a few towns, as does also a proposal to alter the time and duration of legislative sessions in that state. A New York amendment permits the division of large towns in setting up districts for the election of state representatives.

GOVERNOR AND LIEUTENANT GOVERNOR

Two states voted on amendments relating to the election of lieutenant governors and succession to the governorship. In New York elections to fill vacancies in the office of lieutenant governor will not be held hereafter unless the office of governor is vacant also. However, the voters of that state rejected another proposed amendment which would provide for a joint ballot for governor and lieutenant governor. This proposal was intended to eliminate any possibility that those officers would be of opposite parties. A Connecticut proposal, still to be voted on in several towns, provides that the lieutenant governor-elect would assume the office of governor in case the governor-elect should die or otherwise be unable to assume the duties of that office.

SUFFRAGE

Five constitutional amendments were concerned with suffrage. Mention has been made already of the facts that by the adoption of the new constitution Georgia has abolished the poll tax as a requirement for voting, and that Virginia, by action of its constitutional convention exempted members of the armed forces from the poll tax requirement during their services and for three years thereafter. Texas, by legislative proposal and popular ratification, likewise granted poll tax exemption to military personnel, but limited the duration of the exemption to a period of 18 months after discharge.

Kentucky added an absent voting proviso to its constitution, and New York adopted an amendment which will permit a citizen to vote in his old voting district if he moves to another district less than 30 days prior to an election. The New York amendment does not apply to districts in which personal registration is required, however.

LOCAL GOVERNMENT

In addition to the home rule provision of the two new constitutions, five amendments related to local governments. Pennsylvania sheriffs will hereafter be eligible to reelection, and election boards in that state will be chosen by municipal elections in the manner provided by law. Justices of the peace will be abolished in first class cities of Wisconsin.

Local tax limits were relaxed in Michigan so as to permit special levies for public improvements. The New York constitutional restriction on local legislation was modified so as to permit the county supervisors of certain counties to approve local laws by a two-thirds vote over the veto of the county executive officer.

PUBLIC IMPROVEMENTS

Several amendments were adopted in anticipation of a wave of public improvements. The Michigan state government was authorized to engage in the improvement or to assist in the improvement and control of rivers, streams, and water levels. The Pennsylvania legislature was authorized to issue bonds for public improvements; and the Wisconsin legislature was authorized to appropriate funds for the construction and improvement of airports.

"Good roads amendments," under which gasoline and motor vehicle tax receipts may be expended for no purposes other than construction and maintenance of roads and highways, were adopted by Kentucky and Pennsylvania. However, the Pennsylvania amendment authorizes loans from the highway fund for other purposes.

MISCELLANEOUS AMENDMENTS

Other constitutional amendments dealt with veterans' preferences in employment, with membership of a state supreme court, and with social security benefits. A New York amendment requires that for appointments and promotions in the state and local civil services, first preferences must be given to disabled veterans of the armed services, and second preferences to other veterans. The preferential rights of non-disabled veterans expire five years after their discharge from military service. In cases of layoffs, veterans must be given preference in retention.

Texas increased the membership of its state supreme court to nine, and also increased the authorized expenditures for old age assistance, aid to the blind, and aid to dependent children. The $15 limit on monthly payments from state funds to any one beneficiary was replaced by a proviso that the state payment should not exceed the payments from Federal funds.

A proposed amendment which would have specified the purposes for which income tax revenues should be used was defeated by the voters of Alabama.

LEGISLATIVE MEASURES

Only four legislative measures were submitted to popular vote in 1945. Three were referred by the legislatures, and one by popular petition. All of these measures were of a financial character.

The Montana voters upheld the legislature on a referred act to authorize the issuance of tax anticipation debentures in order that the state might match available Federal funds for highway construction. A measure to increase the limit on state subsidies for low rental housing programs was approved by the voters of New York, and an extra tax levy for a public building program was authorized in Oregon, but the voters of the latter state defeated a measure to establish a state cigarette tax.

STATISTICS OF OFF-YEAR DIRECT LEGISLATION

The following table shows the extent of popular participation in constitution making and legislation in the odd numbered years since 1930:

Year	Totals		Constitutional Amendments		Legislative Measures	
	No. of States	No. of Proposals	App.	Rej.	App.	Rej.
1931	8	21	5	10	3	3
1933	15	78	41	15	11	11
1935	12	64	25	13	11	15
1937	7	52	36	13	1	2
1939	12	58	44	6	2	6
1941	7	83	80	2	0	1
1943	7	41	38	3	0	0
1945	12	30	23*	3	3	1

* Including two revised constitutions.

ELECTORAL LEGISLATION

By Howard A. Calkins

Assistant Professor, The University of Texas

GENERAL

Electoral legislation was enacted in 44 states during 1945. Indiana adopted a codification of its election laws, and Maryland revised its election code so as to eliminate duplicated and obsolete provisions, resulting in a code approximately one-half as long as the former laws.

PRIMARIES

Georgia and South Carolina deleted constitutional provisions relating to the primary. A separate primary for nominating candidates for Federal offices in which citizens shall not be denied the voting privilege on any ground prohibited by the Fifteenth Amendment, was provided in Arkansas, the costs to be borne by the counties. Texas made the primary mandatory for all parties that cast 200,000 (formerly 100,000) or more votes in the last general election.

A form showing party enrollment was provided in Massachusetts, and New York amended the law pertaining to special enrollment of voters in a political party and correction of such enrollment. Minor changes relating to filing for candidacy, mostly affecting the filing date, were made in Alabama, California, Florida, New Jersey, New York, Oklahoma, and Oregon. Florida fixed a $25 fee to file for presidential elector, and Maryland abolished the 25-cent fee for each name on nomination petitions. Primary candidates were limited to filing for one office in Minnesota, and Michigan required a candidate filing for more than one office to make a choice or be disqualified. A candidate in Wisconsin must now file an affidavit with the nomination papers stating that he will qualify if nominated and elected. Write-in candidates in Montana must receive five per cent of the votes cast for that office at the last general election; a candidate who has not filed nomination papers must receive in Wisconsin three per cent of the average vote cast for the party's gubernatorial candidate in the two preceding general elections.

Delaware, Maryland, New Jersey, Ohio, and South Dakota made changes in the primary election date, and provisions for filling vacant candidacies were enacted in California, New Hampshire, New York, Oregon, and Wyoming. On the primary election ballot the office incumbent's name was placed first in California, and Wisconsin gave the top-most ticket to the party which polled the greatest number of votes for governor in the last general election. Missouri and New Hampshire made minor changes in the ballot form.

PARTY ORGANIZATION

A number of changes with respect to party organization were made. Arkansas permitted organized political parties to provide qualifications for membership and for voting in their primaries. California legislated with respect to vacancies in county central committees; and Illinois, Pennsylvania, and South Dakota changed the dates for meetings of the senatorial district committee, state committee, and county central committee respectively. Florida defined those minority political parties whose state executive committees may choose, as between the primary and selection by the committee itself, the method of nominating national committee members and presidential electors and of electing delegates to national conventions. Michigan provided that certain congressional districts be considered counties for the purpose of holding conventions to select state convention delegates. Oregon substituted selection of precinct committeemen at biennial elections, on separate ballots, for the primary.

CONDUCT OF ELECTIONS

Many states made changes pertaining to election administration and related matters. The compensation of various election officials was generally increased in 16 states, and 10 states made changes in their number and selection. Legislation was enacted affecting voting precincts in California, Illinois, Maryland, New Mexico, Pennsylvania, South Dakota, and Wisconsin; and polling hours and provisions regarding the posting of election notices were changed in Florida, Maryland, Minnesota, and Utah. Wisconsin authorized time off for employees to vote with deduction for time lost. New York required the identity of voters to be proved. New Hampshire removed the requirement of certification on the ballot to the effect that it had been marked with the assistance of an election officer.

North Dakota prohibited a candidate defeated in the primary from having his name on the general election ballot for the same office. Michigan permitted a ballot-box designation on the ballot's detachable corner and an identification numeral for each candidate. North Carolina forbade the use of titles such as doctor, reverend, etc., on all ballots, and California limited designation of occupation to three words and barred misleading designations. Wisconsin arranged party columns on the ballot according to the party vote for governor in the last general election instead of alphabetically. Texas adopted the presidential short ballot. New Mexico provided for constitutional amendments submitted at a general election to be printed in a column on the right of the ballot. Other minor ballot changes were made in California, Connecticut, Minnesota, Montana, New Mexico, Oregon, Texas, Washington, and Wisconsin.

Connecticut required publication of the election laws after each regular session of the general assembly. Oregon prohibited certain materials in voters' pamphlets, and Montana instituted such pamphlets for constitutional amendments. Election contests were affected by legislation in seven states, important changes being those in Nebraska and West Virginia requiring a contestant to post a bond covering costs if the contest fails, in New Hampshire requiring a contestant to agree to pay the expenses of a recount in certain cases, and in Missouri where a contested election for governor is to be decided before the Supreme Court instead of the lower house of the legislature. Alabama required presidential electors to vote for the nominee of the national convention of the party by which they were elected. Alabama, Illinois, Maryland, New Jersey, New York, and Texas made changes affecting voting machines, Alabama and New Jersey authorizing rental agreements.

CORRUPT PRACTICES

Ten states enacted corrupt practices legislation. Arkansas and North Dakota required the names of sponsors of political advertising to be shown; Nebraska ordered information on political expenditures by public power districts. Georgia, Maryland, and Oregon legislated with respect to the sale of liquor on election days. Wisconsin increased the amounts of campaign expenses for state senator and assemblyman. California, Florida, Georgia, Maryland, and New York made minor changes.

SUFFRAGE

Georgia amended her constitution to delete, as entitling one to vote, the "grandfather clause" and ownership of 40 acres as residence in the state or of property assessed at $500, and to eliminate payment of the poll tax as a prerequisite for voting. Texas and Virginia made constitutional changes to permit persons in the armed forces to vote without having paid a poll tax. Texas required persons entitled to poll tax exemptions to secure an exemption certificate annually. New York provided for proving citizenship by affidavit where naturalization papers are lost or destroyed. Delaware made necessary a declaration of intent to become a resident and one year's residence thereafter for those coming into the state, and Maryland abolished the affidavit of non-intention to change residence by persons leaving the state temporarily. Connecticut eliminated conviction of crime as a bar to voting and, with Oregon, legislated for the re-enfranchisement of convicts. New York exempted from the prohibition against felons' voting any person who has received a certificate of good conduct from the board of parole.

REGISTRATION

Numerous changes in registration relating to such matters as date and hours, transfers, indexes, permanent registration offices, and duties of registrars were made in 19 states. In Pennsylvania boroughs, towns and townships, and cities of the first, second, second-A, and third classes, a broader definition of those in the armed forces was added, biennial cancellation of registration was put on a calendar basis, various registration dates were changed, and the quadrennial checkup was made optional. West Virginia repealed her quadrennial checkup. Regarding cancellation for non-voting, Connecticut abolished this until 1951, Georgia adopted biennial cancellation, New Mexico advanced the date, and Washington lengthened the period for non-voting to four years. Michigan extended her general registration act to villages; Illinois made registration necessary in counties under 500,000 to vote for county and certain judicial officers; Maryland effected in substance permanent registration, both in counties having permanent boards of registry and in those not having such boards. Absent registration was provided in a number of states for those in the armed forces, in Massachusetts for those physically disabled, in Oklahoma for those temporarily absent, and in Washington for those within the county of the voting precinct.

ABSENT VOTING

Kentucky and Missouri adopted constitutional changes permitting absent voting outside as well as within the state. Colorado authorized absent voting by a person moving to another county within 90 days prior to a primary or general election. Connecticut and Maine extended absent voting to municipal elections and city primaries, respectively; Alabama abolished it in special elections. Massachusetts included physically disabled persons, and Minnesota relieved voters from the expenses of voting by mail. In 14 states, changes in the law were made relating to absentee ballots—instructions, time and method of securing, method of marking, and counting and preserving.

Twenty states enacted or amended laws relating to voting by members of the armed or auxiliary services, many of these having the effect of extending laws previously enacted with definite expiration dates. Iowa created a war ballot commission with broad powers to make changes in forms; New Mexico granted the Secretary of State similar authority; and New York repealed its act and provided a temporary war ballot commission to supervise voting by members of the armed services. Oklahoma amended her law to make it applicable to run-off primaries.

REFERENDA AND LOCAL LEGISLATION

Constitutional changes affecting elections were adopted in six states: Georgia and South Carolina—to eliminate constitutional primary regulations; Georgia—to delete as voting qualifications the "grandfather clause," ownership in the state of 40 acres of land as residence or of property assessed at $500, and payment of a poll tax, and to clarify regulation of the sale of intoxicating liquor on election days; Kentucky—to authorize absent voting; Missouri—to permit absent voting from outside the state, to decide a contested election for governor before the Supreme Court, and to change the date for selecting the state auditor so as not to coincide with the election of other state officers; Texas and Virginia—to eliminate payment of a poll tax by members of the armed forces as a prerequisite for voting.

Constitutional amendments were initiated in nine states: Alabama—to add suffrage qualifications requiring ability to understand and explain any article of the United States Constitution, good character and understanding of the duties and obligations of good citizenship under a republican form of government, and to delete, as a voting qualification, ownership of 40 acres of land in the state or of property assessed at $300; California—to permit an initiative act to be amended by legislative act upon approval by the voters; Colorado—to provide that no ballot be marked in any way whereby it can be identified as the ballot of the person casting it; Connecticut—to authorize the legislature to provide offenses for which voting privileges may be forfeited and methods by which such rights may be restored, to provide four-year terms for governor, lieutenant governor, secretary, treasurer, comptroller, and probate judges, and to provide for the lieutenant governor elect to qualify as governor in event of the death of the governor elect; Delaware—to provide four-year terms for sheriffs and coroners, and to authorize absent registration of persons in the armed services; Indiana—to provide a four-year term for sheriff and an 18-year-old voting minimum; Kansas—to authorize the legislature to provide the method of filling vacancies in the legislature; Pennsylvania—to delete the one-year term for district election boards, permitting regulation by statute; and Wyoming—to provide for filling vacancies in the state legislature for the remainder of a term by special election.

California, Colorado, and Oregon enacted legislation affecting initiative and referendum petitions, and Oregon authorized counties to adopt by referendum a county manager form of government.

Various special and local laws affecting elections were enacted in Alabama, California, Colorado, Delaware, Georgia, Idaho, Illinois, Indiana, Kansas, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Mexico, New York, North Carolina, Oklahoma, Pennsylvania, Rhode Island, South Carolina, Texas, Virginia, Washington, and Wisconsin.

COUNTY GOVERNMENT

By Mary Capen Davis
Instructor, New Jersey College for Women

GENERAL

The year 1945 was not only a legislative year, it was also the year which saw an end to the war. This dual fact is reflected in the amount of governmental activity on the county level and in the nature of that activity. The problem of attaining effective local administration with all that it implies for the forms of government, proper organization of functions and extension of civil service practices continues to occupy state officers and citizens, but there are now added considerations of veterans' aid, public works planning on a broad scale, and the extension of governmental functions to meet a variety of post-war needs.

CONSTITUTIONAL CHANGES IN MISSOURI AND GEORGIA

The two major constitutional developments of the year occurred in Missouri and Georgia, both of which adopted new constitutions, the former in February and the latter in August. The Missouri constitution contains a number of provisions whose total effect will be to simplify and make more effective the pattern of county government in the state. The governing body of counties becomes a board of commissioners rather than a county court, with a mixture of judicial, legislative, and administrative functions. Counties are to be classified into not more than four classes, thus reducing the possibility of special legislation. The counties may consolidate, dissolve or partition themselves. They may join in performing common functions. A city and a county may consolidate their functions in any county, and the city and county of St. Louis may consolidate under either the city or the county or may establish a metropolitan district to perform their common functions. Finally, county home rule is authorized for counties of more than 85,000 inhabitants.

The provisions of the new Georgia constitution affecting counties deal with questions of finance, education, and the consolidation of counties. The purposes for which counties may tax are broadened in scope to include administrative expenses, airports, docks and libraries, reasonable reserves for public improvements, workmen's compensation, and retirement funds for employees. Counties are also authorized to obtain temporary loans. There seems to be some question whether the constitution does or does not allow counties to issue bonds without new enabling acts by the General Assembly. Article 8 provides for county-wide school systems to replace separate school districts, except for independent city systems, and directs the county boards of education to set the school tax rate. These provisions also await clarification as to whether or not they abolish rural school districts and place school financing on a county-wide basis. There are to be no new counties except by consolidation, and such consolidation is authorized if a majority of the qualified electors voting in each county approves. The General Assembly may provide optional systems of consolidated county and municipal governments.

CONSTITUTIONAL AMENDMENTS IN NEW YORK AND CALIFORNIA

New York amended its constitution on Nov. 6, 1945, to allow a request for special state legislation from a county which has a governing body and an elective executive officer despite the disapproval of that officer if such a request is passed again by a two-thirds vote of the governing body. The California legislature implemented a previous amendment which authorized it to suspend the constitutional prohibition against increase of the compensation of county, township and municipal officers. This is an emergency measure to continue only until six months after proclamation of the end of the war. It is designed to meet the problem of rising living costs for local officials.

OPTIONAL FORMS OF COUNTY GOVERNMENT

The trend toward optional forms of county government continues slowly, with failures mixed with the successes. Oregon passed its proposed law providing for adoption of a county manager form of government upon a majority vote of the county electors voting. The law also abolished all elective and appointive county offices vesting their power in the County Board which is empowered to appoint the manager on merit alone and order an annual audit. County administration is thus streamlined and placed on a merit basis. The Nebraska legislature allowed counties under township organization to vote to change to a commission system.

Washington and Wisconsin supply the debit side of the ledger. In the former state a bill to allow county manager government for King County (Seattle) and a bill allowing Washington counties to adopt home rule charters failed to get out of committee.

Wisconsin continues to have difficulty with amending its constitution to allow optional forms of county government, including the county manager plan. An amendment to the Wisconsin constitution has to be approved by two successive legislatures and then by the voters in a referendum. At present the constitution requires a uniform system of county government. In 1941 and now once more in 1945 a resolution to amend to allow optional forms was defeated after passing in the preceding legislative session. As one way of dealing with this situation and continuing the campaign for reform, a joint interim committee to study county government in Wisconsin was established by the 1945 legislature. The leaders of the campaign intend to continue until it reaches a successful issue. (cf. Weidner, E. W., "County Reform Run-Around," *Nat. Municipal Review,* Sept. 1945.)

CONSOLIDATION OF CITY AND COUNTY OFFICES OR FUNCTIONS

As an alternative to complete reorganization of the form of county government, which as a program often encounters many difficulties with old habits and entrenched interests, partial reorganization through consolidation of offices or functions seems to be gaining momentum throughout the country. This trend is evident in connection with new functions assigned to counties, but it is particularly significant in the area of county-city relations. Contiguous or overlapping city and county jurisdictions have provided some of the more picturesque difficulties in local government with intense political complications. Philadelphia is a long-standing example of this situation. As one step toward eventual consolidation, the Pennsylvania legislature passed a law providing that salaries of those county officials paid from the treasury of the city of Philadelphia shall be fixed by ordinance of the City Council instead of by numberless county boards and commissions. In Alabama a commission has been established to investigate the question of government consolidation in Jefferson County, which includes the cities of Birmingham and Bessemer. On a more limited scale, Fulton County, Georgia, is allowed to increase its budget to maintain a Hospital Authority which will include Atlanta. Fulton County and Atlanta are also allowed to operate trade and vocational schools jointly. The *National Municipal Review* (June, 1945), reported that joint city-county health departments are on the increase throughout the country. California has provided several optional patterns of consolidation of county offices for county supervisors to elect.

COUNTY MERIT SYSTEMS

Extension of civil service on the county level continues to be steady. Riverside County, California, and Outagamie County, Wisconsin, have adopted new classification and pay plans. Fulton County, Georgia, has extended its merit system to include police and fire departments and the county agricultural agents and further gives the County Commissioners the right to prefer charges against employees in the classified service for violation of civil service rules. An Oregon law establishing a merit system of personnel administration for the state civil service allows the state civil service commission to furnish service to any locality in the administration of its personnel and merit principles. Pennsylvania, Montana, Oregon, Indiana, Michigan, and Tennessee established retirement systems for county employees.

EXTENSION AND REORGANIZATION OF COUNTY FUNCTIONS

The volume of legislation in the past year, pertaining to county functions, is such as to preclude any itemized account of it. Two tendencies, however, are nearly everywhere apparent. In the area of previously established county functions, the prevailing movement seems to be toward consolidation of operation and standardization of procedures. Consolidation is to be observed within the county and between counties as well as between a county and a city. Where new functions are bestowed upon the county these deal primarily with problems arising out of or aggravated by the war stiuation.

The first category includes such items as health, roads, and finances. Washington, for example, has authorized health districts of two or more counties or of a city and a county, and Pennsylvania has authorized the construction and operation of joint county or city and county contagious disease hospitals. A county-unit system of roads has been adopted in Kansas, and in Potter, Galveston, and Brazos counties, Texas. Pennsylvania has clarified the respective responsibilities of counties and state for highway construction and maintenance, bringing the counties under more direct supervision of the state Department of Highways. In regard to finances, standardized budget procedures have been established in California, Wyoming, Nebraska, and Colorado, while Tennessee passed budget laws for three counties and established a purchasing agent or commission in the same counties plus two others. The Kentucky Department of Revenue has proposed a new policy for assessment of property which would bring reasonable uniformity and certainty into the system of land valuation.

Some new functions designed to meet special post-war needs have been allocated to counties across the nation. The importance of air communication has led Colorado, Delaware, Pennsylvania, Texas, Washington, and West Virginia to permit counties, either singly or in conjunction with other local governments, to acquire land for, and establish and maintain, airports. California counties may appoint a harbor commission to make surveys and plans for harbor development. Such harbor programs may be financed by bonds or additional taxation. Redevelopment of blighted areas is the subject of legislation in California and Pennsylvania, enabling counties to establish and finance redevelopment authorities to work out and administer comprehensive redevelopment programs.

POST-WAR PLANNING

Despite the demise, at the hands of Congress, of the National Resources Planning Board, it has been generally accepted that some broad program of public works would be necessary to cushion the shock of reconversion and absorb unemployment in the immediate post-war period. Furthermore, nearly all communities have accumulated a backlog of necessary repairs and construction during the war years. To meet this situation, the states and their subdivisions have been developing planning machinery and working out projects. Two patterns seem to have been followed. Some states, for example, Colorado, Connecticut, and Wisconsin, authorize the counties to set aside out of their own moneys special funds to be used for post-war projects. Other states have undertaken the establishment of state and local planning machinery and have shouldered part of the financial burden for the localities. Illinois has created a Post-War Planning Commission which is to approve local projects and allocate state funds.

In Michigan a hierarchy of planning commissions has been authorized; a state planning commission, which in turn may create regional commissions where necessary and county planning commissions set up by the counties themselves. State financing of local projects is to be on a matching basis. New Jersey appropriated money in 1944 for preliminary local plans and specifications for post-war public works. Approval of these preliminaries and allocation of the funds for detailed plans is the function of the state Commissioner of Economic Development. By July 1, 1945 all counties had projects approved for a variety of public works. The board of county supervisors in each county in New York State has been authorized to set up a county planning commission. Such local authorities may apply to the Temporary State Commission for Post-War Public Works Planning for grants to make both preliminary studies and final plans of public works projects. Pennsylvania has also authorized its Post-War Planning Commission to approve local plans and specifications and to agree to finance them up to 50 per cent of their cost.

VETERANS' AID

Specifically, county services to veterans within the general state programs fall in the main into three classes. In California, Colorado, Illinois, Michigan, Minnesota, New York, Oregon, Pennsylvania, Tennessee, and Wisconsin, the counties are authorized to appoint a veterans' service officer or commission charged with the general duty of assisting veterans and their families to avail themselves of those benefits and compensations provided for them by Federal or state laws. Kansas, New York, Oregon, Pennsylvania, and Texas have directed their counties to provide, free of charge to all veterans, certified copies of discharges and other military records. Finally, counties in Iowa, Oregon and Washington must pay relief to indigent veterans and their families, and New Jersey, Oregon, Pennsylvania, and Washington make provision for counties to assist with the burial expenses of deceased service men. The major part of the state veterans' programs, however, has been operated to date directly by the state machinery without particular utilization of the counties.

FEDERAL AND STATE AID TO COUNTIES

A natural concomitant of expanded county public works programs is an increased need for financial assistance. As such programs are designed to make up a national drive on post-war unemployment some help is expected to come from the Federal Government. Several states have passed legislation authorizing the counties to accept Federal aid either for general public works activities, or for specific projects such as airports and redevelopment of blighted areas. The *National Municipal Review* (November, 1945), reports that the localities are now waiting anxiously on congressional action to discover how much aid will be forthcoming and for what purposes. As was previously mentioned, the states themselves have provided in many instances for state support of a percentage of county plans. State aid continues to be made available for such regular functions as agricultural research, forestry, and education.

GOVERNMENTAL STUDY OF COUNTY PROBLEMS

There are encouraging indications in some states of legislative interest in the effectiveness of counties generally or in regard to particular services. This interest is evidenced by the establishment of committees to study various aspects of county government. Mention has already been made of the Wisconsin Joint Interim Committee to investigate the structure of county government in that state and make recommendations concerning it to the 1947 legislature. The New York Uniform County Laws Commission created in 1944 has been continued and has already had hearings on such questions as broader legislative power for counties, a uniform budget system, and the county manager plan. In New Hampshire an interim committee has been appointed "for study and analysis of existing laws and methods relating to the general subject of county government and its relationship with state and local government" (ch. 231). Connecticut has directed its legislative council to consider the county as a unit of government and its relation to the state with particular reference to the problem of the care of neglected children. Finally, Pennsylvania has appropriated money to the Joint State Government Commission to develop "a sound financial highway program for the Commonwealth and its political subdivisions and an equitable basis for state aid to local governments" (Act No. 55-A).

CONCLUSION

Even this brief review of county government activities during the past year gives evidence of a dual development for counties which seems to be continuing slowly but steadily. On the one hand, there is an extension of county functions to meet a growing demand for service. This is part of the expansion of governmental activity on all levels as social relations and technologies become more intricate. More impressive despite obvious halts is the gradual progress of measures designed to make county government more effective and responsible. That expansion should in many cases be accompanied by reform is an encouraging phenomenon.

DIVISION V

MUNICIPAL GOVERNMENT

NEW YORK CITY AFFAIRS

By Theodore H. Skinner
Professor, School of Government, New York University

GENERAL

In the City of New York, as in the rest of the nation, the year 1945 was notable for its contrasts. Grim determination to win the war and to endure discomfort to that end gave way to wild enthusiasm over victory in Europe and the Orient, and to the largest retail sales in the city's history. The city streets were dim in January and brilliant in December. Cooperation between management and labor in the early months was succeeded by strikes and threats of strikes. Twelve years of non-partisan government under a Fusion Mayor and administration ended in the triumph at the November election of the Democratic party organization.

THE MAYORALTY CANDIDATES

As the year commenced, keen interest was centered on the two men who opposed each other in the 1941 campaign, Mayor LaGuardia and William O'Dwyer. To many it seemed quite logical that the Mayor, three times elected to that office, would attempt to emulate his friend and supporter, the late President Roosevelt, and try for a fourth successive term. However, throughout the early part of the year, the Mayor remained uncommunicative as to his intentions, his attitude offering a sizeable obstacle to any early, effective organization of the various groups which had been aligned in the Fusion movement. General O'Dwyer had served in the Army during the war, achieving the rank of Brigadier General and had been assigned to head the War Refugee Board. Returning to his duties as District Attorney of King County, he conferred with Brooklyn Democratic leader, Frank Kelly, and announced that he would not be a candidate, thus apparently leaving the field wide open to all aspirants for the honor. The leaders of the American Labor Party announced that they were keeping an open mind on the matter, but would insist that the candidate, to obtain their support, must be sympathetic to the foreign and domestic program of the President, while the Liberal Party merely stressed opposition to any "machine type" nominee.

As the Mayor had gradually antagonized the local leadership of the Republican Party during his tenure of office, there was considerable doubt as to whether he could obtain approval of his candidacy. Preliminary conversations were initiated by some of the Democratic leaders looking to a Democratic-Republican fusion to oust LaGuardia, but nothing came of it as the Republicans were unwilling to support any of the men suggested by the other party. However, Secretary of State Curran, the Republican leader of Manhattan, reported that 80 per cent of his district leaders were opposed to further support of LaGuardia and indicated that he favored a primary fight in case he insisted on the nomination, and City Magistrate Abner Surpless of Brooklyn, an old-time foe of the Mayor, announced that he would throw his hat into the ring. Judge Samuel Seabury and 45 others, who had played a prominent part in previous fusion victories, wrote Governor Dewey, urging him to use his influence to rally Republican support behind the Mayor, while the National Republican Club went on record as disapproving any candidate who was not a regular member of the party.

In April, Comptroller McGoldrick, long a wheelhorse in the Fusion administration, broke with the Mayor and voted to approve an increase in the budget, thus widening the rift between the two, growing out of their differences over Brooklyn slum clearance the previous year. This led to suggestions that McGoldrick head a bi-partisan ticket and effectually forestalled any possibility of the two men continuing as political associates. At the same time the picture was further clouded by the death of President Roosevelt. La Guardia had supported the President in his campaigns, and the latter had reciprocated when the mayoralty was at stake. With the accession of Truman, a strict party man, to the Presidency, the Democrats might properly expect administration support for an organization candidate.

Early in May the Mayor announced that he would not again be a candidate, giving as his principal reason a belief in the desirability of bringing fresh minds and fresh abilities to the city's government. Furthermore he said, "I have worked very hard and had no rest or vacation in twelve years." He then named a dozen individuals whom he felt well qualified to succeed to the office, among them Council President Newbold Morris. The name of Joseph D. McGoldrick was conspicuous by its absence, an indication that any ticket headed by the latter would meet with the Mayor's bitter and effective opposition. With the withdrawal of LaGuardia, the leading candidate of the American Labor Party, that organization gave an unofficial endorsement to O'Dwyer.

In the meantime the right wing of the old Labor Party, now operating as the Liberal Party, was suggesting that it would combine behind the candidacy of either McGoldrick, Justice Pecora, former Justice and Presidential adviser Samuel Rosenman, or General Sessions Judge Jonah J. Goldstein. All of these were Democrats and the last had received serious consideration as the Democratic nominee. Meanwhile, despite his earlier refusal to be a candidate, two of the five Democratic leaders, Representative James A. Roe of Queens and Jeramiah Sullivan, continued to press for the nomination of O'Dwyer, with Manhattan leader Edward V. Loughlin willing to go along. A business men's committee was formed to further the demand for the Brooklyn District Attorney, and shortly after he reconsidered his decision. When his own leader Frank Kelly and national committeeman Edward J. Flynn of the Bronx continued to remain outwardly indifferent to him, O'Dwyer indicated that if necessary he would fight it out in the primaries. Eventually Kelly and Flynn came around and O'Dwyer became the official nominee of the Democratic organization, receiving also the nomination of the Labor Party.

With the formal announcement of the Democratic decision, the Citizens' Non-Partisan Committee, the coordinating agency of past fusion movements, persuaded Governor Dewey and the Republican high command to designate Judge Jonah J. Goldstein as their nominee, with the Liberal and Fusion parties following suit. A number of the Republican district leaders were disgruntled by the selection of a regular Democrat as the Republican standard bearer, but no effective opposition developed. However, Council President Morris voiced bitter personal opposition to Goldstein's selection, and refused to accept redesignation as his running mate on the ticket. Accordingly Municipal Court Justice Nicholas M. Pette, a Republican was substituted, with

Comptroller McGoldrick agreeing to run for reelection.

THE CAMPAIGN

It is highly probable that the preliminary skirmishing in the Democratic organization was of considerable value to General O'Dwyer as it relieved him of the stigma of being an "organization" candidate and emphasized his "independence." This impression was furthered by the candidate shortly after his nomination. Originally selected as his running mates were Assemblyman Irwin Davidson of Manhattan for Council President and Lawrence Gerosa of the Bronx for Comptroller. Neither of them could be considered as strong candidates, being run-of-the-mill party men with no particular claim to superior ability or municipal "know how." O'Dwyer refused to accept them as his running mates and forced the substitution of State Senator Lazarus Joseph, one of the ablest members of the legislature, for Comptroller and former Assistant District Attorney Vincent Impelletteri of Manhattan for Council President. Meanwhile the Manhattan organization had refused to renominate District Attorney Hogan who had been elected originally as the candidate of both major parties. O'Dwyer then announced that he would refuse to accept the new designee as his running mate and forced leader Loughlin to reconsider and renominate Hogan. Both of these actions tended to increase the impression that the head of the Democratic ticket would be his own man and run the office without accepting direction from the county leaders. The idea of independence was furthered throughout the campaign by the regular organization remaining discreetly in the background while all publicity was given to the Independent Citizens' Committee for the election of O'Dwyer.

In August Mayor LaGuardia exploded a bombshell in the fusion camp by announcing the entry into the campaign of a "No-Deal Party" headed by Newbold Morris, with Tax Commissioner Joseph Levine the nominee for Comptroller, and Magistrate Peter Horn for Council President. The Mayor announced that this ticket would offer a chance to vote for a real independent non-partisan slate as contrasted with the earlier nominees, both of whom were accused of being mere cogs in the Democratic machine, the election of either meaning a return to the "old philosophy of government, based on the theory that tax revenues are the spoils of political victory."

Compared to previous campaigns in which Mayor LaGuardia was actively engaged, that of 1945 offered little excitement. As was to be expected O'Dwyer insisted that he was a believer in "good government." Given the support of the Communists, largely on the ground that his election would assure the continuance of the New Deal in the nation, he vigorously disavowed all such support, without of course losing any of it. He denounced racial and religious discrimination, particularly assailing Senator Bilbo of Mississippi, and stressed the need for prompt economic assistance to Italy. He promised to curb underworld influence and suggested a specialized tribunal for wayward youth. More schools and teachers would be his first order of business and the depleted police force would be expanded to its authorized strength. An immediate extension of unemployment insurance, speedy assistance to veterans, the immediate construction of additional low cost housing, and adequate medical care for all. Turning to purely municipal affairs he charged that the state had been short-changing the city in the collection and distribution of taxes, alleging that of the amount annually collected by the state from city sources barely one-sixth had been returned to the metropolis, and pledged himself to vigorous measures to assure a more equitable distribution.

Judge Goldstein, the fusion candidate, advocated a $2,700,000 public housing program, with expense shared by Federal, state, and city governments, more schools and teachers and the establishment of a city medical college, and promised the establishment of a city bureau of veterans' affairs, a city department of commerce to further economic progress, and a city commissioner of industrial and labor relations. He placed most of his emphasis on the charge that there would be gangster rule if O'Dwyer were elected, claiming that his opponent was put in the race by racketeers and the Communist-controlled Labor Party. He charged O'Dwyer with close acquaintance with Frank Costello, Joe Adonis, and Irving Sherman all of whom were actively behind his candidacy. In this connection he obtained the support of Governor Dewey and the Republican appointive District Attorney of King County, George Beldock. The latter presented evidence to the Grand Jury resulting in a presentment by that body to the effect that O'Dwyer had been guilty of criminal laxity in not pressing investigations of racketeering on the Brooklyn water front. The Democratic nominee ignored the charges regarding Costello *et al.*, but answered the presentment by the statement that he was absorbed at the time mentioned in his successful prosecution of Murder Incorporated.

The third candidate, Morris, continued to emphasize his complete independence of all political bosses, Republican and Democratic alike, and pledged a continuance of the LaGuardia type of municipal administration. Fighting against the Tammany system which had nurtured both Goldstein and O'Dwyer, he predicted that the election of either would bring about the return of gamblers, appointment of "club house loafers" to important city positions, extensive graft in city contracts, and a general breakdown in the efficiency of the city's administration.

It will be noted that, as is so frequently the case, the campaign involved an undesirable mixture of purely municipal affairs with various aspects of national politics and administration. Thus the voter was frequently uncertain as to whether he was voting for a Mayor or for a President. A considerable number could easily have felt, as the campaign progressed, that the election of Judge Goldstein would send Governor Dewey to the White House in 1948, or that a victory for O'Dwyer would insure the continuance of the New Deal. Such a confusion of national and municipal issues is to be deplored, but seems inevitable as American politics is now organized.

THE ELECTION

To many observers the entry of Morris into the race and the defection of the Labor Party from the Fusion ranks made the outcome of the election a foregone conclusion and deterred a number of voters from exercising their franchise. When the results were tabulated, a total of 1,119,225 votes had been cast for O'Dwyer, with 434,050 for Goldstein and 399,437 for Morris. That the latter could roll up such a total while running independently could be considered a moral victory while at the same time illustrating once again the complete hopelessness of any purely independent movement in municipal politics. While the Democratic organization captured City Hall, the election totals were not too encouraging. It will be noted that the Democratic party vote constituted only 42 per cent of the total, 260,000 having been contributed by the American Labor Party. Thus, with a continuing alliance of the Laborites and Morris supporters with the other Fusion groups, as in 1937 and 1941, the Democratic candidate would have been defeated.

Another interesting feature of the election was the poor showing of the Republican Party. Goldstein could secure only 302,000 votes on the Republican line in contrast to the 400,000 cast for Morris. This was a drop of 400,000 from 1941 and reduced the party to its weakest position since 1917. It seems evident that the only prospect for Republican success in the future lies in wholehearted fusion with other anti-Democratic groups.

Among the losers, Comptroller McGoldrick made the best race, running well ahead of his ticket. However, O'Dwyer was able to carry his entire ticket with him, with the exception of the borough presidency in Richmond, which went to an independent Democrat running with Republican endorsement.

THE NEW ADMINISTRATION

After his election, the Mayor-elect gave partial indication of his independence of machine politics. He announced his intention to retain, at least for the time, a number of Mayor LaGuardia's department heads. Chief among these was Park Commissioner Robert Moses, who had supported Morris. Not only was Moses to be retained, but he was given the additional task of supervising and coordinating all public construction undertaken by the new administration. Other hold-overs included Purchase Commissioner Emile Pleydell, Health Commissioner Ernest L. Stebbins, and Police Commissioner Arthur W. Wallender, the latter a career man who had succeeded Commissioner Valentine a short time before.

With the election of a Democratic Mayor, it was a foregone conclusion that the new Council would also be safely Democratic. The final distribution of the P. R. ballots indicated a total membership for the new four-year term of 23: 14 Democrats, two Republicans, two each American Labor and Liberals, two Communists, from Manhattan and Brooklyn, and one Independent. This represents a gain of three Democrats, one Liberal, and one Laborite, and the loss of one Republican, the size of the Council depending on the total vote cast. That the Democrats, with only 42 per cent of the Mayoralty vote, were able to elect 60 per cent of the Council, is explained by the fact that Democratic voters utilized their choices to their full extent; the voters of other parties did not.

THE SCHOOL SYSTEM

Although New York has been justly proud of its schools as among the best in the nation, the system was the center of acute controversy during the year. For the first time in a quarter of a century the city faced a serious shortage of teachers. Reversing the non-appointment policy that had been in effect for the past 14 years, numerous appointments to the teaching staff have been made without relieving a serious shortage of instructors. The high wages offered by industry, the numerous war jobs, and various other positions available to teachers resulted in approximately half of all appointments being declined. The originally large reserve of eligibles in the elementary schools was exhausted, and it became necessary for new examinations to be given. As a result of the teacher shortage it was estimated that over half of the high school classes were above the norm of 35.

Part of the system's difficulties was owing to a lack of funds. Until 1945, the city's share of state money for education amounted to $44,000,000, based on a distribution formula which had become obsolete. In 1945 this formula was revised and the city received an additional $6,000,000. However, educators insist that still more funds must be appropriated, and this, with its restricted taxing power, the city felt unable to do. As a result, individual and group complaints were frequent. Demands for sweeping inquiries were made by the Teachers' Guild; resolutions demanding investigation were introduced at Albany and in the City Council; none of them, however, produced results.

The controversy over the shortcomings of the Board of Education and the Superintendent of Schools came to a head in October, when the head and a majority of the membership of the Board's advisory committee on human relations resigned. The previous year school officials, feeling that the school and community should be brought together more closely, asked leading citizens to form an advisory committee to examine possible methods of coordinating school and community activities. The committee was headed by Frank E. Karelson, Jr., president of the

Public Education Association. With dramatic suddenness, Karelson resigned, charging that neither he nor his committee had received any cooperation from the board and that its reports had been pigeon-holed without ever being considered or made public. In addition, in a series of newspaper interviews, he charged that there were from five to 15 classes in each school without teachers, that there were too few attendance officers to combat truancy effectively, and that many of the services requisite to a good school program were completely lacking.

The Superintendent replied that the schools were doing a good job and that it was not the business of the committee to intervene in school matters, but only to advise regarding community problems. He thereupon appointed Dean Russell of Teachers' College to head and reorganize the committee.

Meanwhile, Karelson and the other resigning committee members formed a new committee and proceeded to demand that immediate action looking to improvement be taken. They urged a complete shakeup in the system and set up a 14-point program designed to provide a better education for the city's youth, including smaller classes, particularly in tension areas, a complete teaching staff in every school, additional personnel in the Bureau of Child Guidance, and additional human relations counselors with proper training.

The Superintendent countered by pointing out that New York was already spending close to $180,000,000 for educational purposes, and that the committee proposals would entail an additional expenditure of $50,000,000, inquiring as to where that amount might be secured.

The committee called upon the Governor to direct the State Department of Education to investigate. The Governor turned the request over to the Board of Regents who in turn directed the Commissioner of Education to take jurisdiction. As the year ended, no further statement on the subject had come from Albany.

The Mayor leaped to the defense of the Board and directed his Commissioner of Investigation to investigate the situation. After a number of closed hearings, he found that the committee's charges were unfounded and gave the school system a clean bill of health. At the same time, the Board issued a special report answering the committee and claiming that progress was being made on all points at issue. The Board stated: "We are not suggesting that the New York City school system is free from faults, but we do say that when any deficiencies are found, every effort is made to correct them." The committee countered that the Board had withheld information, had painted a picture of non-existent conditions, and was merely beclouding the issue. What disposition of the matter Commissioner Stoddard might make remained to be seen, but there was every indication that educational problems would continue to provide the new Mayor with a sizeable headache throughout his tenure of office.

EMERGENCY RENT CONTROL

Rent control of residential property, which had been imposed in 1943 by Federal statute, remained in operation, resulting in considerable complaint, particularly from the owners of small properties. While some adjustments were made covering hardship cases, the general picture remained basically the same. The problem of commercial rents, which did not come under Federal regulation, became increasingly acute during 1944 and led to the enactment by the state legislature of a rent control law for business properties, utilizing the same formula as was applicable to residential owners. Lawsuits were undertaken immediately to test the new law and, while successful in the lower courts, failed to obtain its invalidation by the Court of Appeals. Even the retroactive aspects of the legislation affecting contracts, entered into before its final passage, were upheld. A slight breach in residential rent control was effectuated, however, when the Federal Emergency Appeal

Court held that it could not apply to luxury apartments, namely those renting for more than $2500 per year. Rent control was also held not to apply to properties rented on a seasonal basis, such as summer homes or beach cottages.

SHORTAGES AND BLACK MARKETS

As in previous years, the City again found itself confronted by problems growing out of the nature of a war economy, which could only be handled in cooperation with state and Federal authorities. Coal again was scarce in the early months of the year, though not so much so as in 1944, and rationing to a slight degree became necessary. In order to conserve power the Office of War Mobilization directed a minimum use of exterior illumination, so the city streets were dim and the "Great White Way" a mockery until victory was secure.

Possibly most annoying to the average American was the continued shortage of cigarets, resulting in part from prior demands of the armed services and in part from the diversion of normal distribution to black market outlets. Although city authorities made spasmodic attempts to meet the evil, little was accomplished until the state tax authorities utilized potential prosecution for tax evasion to compel more equitable distribution to retail outlets.

The meat situation continued to plague the authorities. Although a ceiling was placed on cattle prices, black markets continued to absorb much of the finished product. In fact some sources estimated that at least 75 per cent of all meat sold in the city was above ceiling price. Mayor LaGuardia, confronted with closing half the city's meat markets for lack of supplies, provided a graphic demonstration of the underlying difficulty by the purchase of a steer and its slaughter for the city—at a loss. Possibly influenced by his action Federal authorities eventually took action which provided considerable relief.

In similar fashion New York's greengrocers took direct action to spur adequate Federal action by staging a shutdown of their stores which closed more than half of the shops in the city—their complaint, that wholesalers' overceiling prices compelled them to operate at a loss.

All of these cases demonstrated the inability of any city to take effective action solely by its own efforts. The understaffed Markets Department undertook to cooperate with state and Federal inspectors in the apprehension of violators, but their efficiency was greatly curtailed by the abolition of a special centralized city court for price and rationing offenses, the result of sudden state legislation. This statute required trial of all such offenses in the borough where committed, thus requiring the officers to devote a much larger part of their time to appearances against offenders.

At the close of the year, with all rationing controls lifted, the city was temporarily threatened with cessation of all meat supplies by reason of the strike of the meat packers' union. Fortunately the threat did not materialize.

HOUSING

Owing to the diversion of building material to war needs, all new construction in the city was virtually at a standstill during 1945. The Metropolitan Life Insurance Company began clearing the ground for its ambitious redevelopment project along the East River, and the operations of the City Housing Authority were limited to planning for the future. Even after V-J Day the material shortage, together with jurisdictional disputes among construction workers prevented any large-scale operations.

After four years of war with a minimum of building, the city was confronted with a housing shortage more acute than that of 1920. Buildings of every type were filled to capacity, returning veterans were compelled to accept makeshift accommodations, the visitor to the city found hotel accommodations limited to five days, if not refused entirely. Confronted by this crisis, the Mayor was slow to take any action even when the opportunity to obtain temporary war purpose structures from the Federal Government was offered. Eventually he proposed to alter the building regulations temporarily so as to permit attic and basement apartments in normal one- and two-family homes, together with exemption from taxes on improvements where unused "old law" tenements were reconstructed. The proposals met with severe opposition from city planning and housing experts. At Albany, the Governor made arrangements with the Federal Government for the transfer of several service installations within the city and prepared to transform them into apartments for the use of ex-service men.

ZONING AND PLANNING

The McGoldrick program for reclaiming the blighted areas near the Brooklyn Borough Hall, the occasion for his first serious rift with the Mayor, as the necessary enabling legislation was passed at Albany, Brooklyn savings banks signed contracts to buy the land after it has been appropriated, cleared and rezoned by the city.

Manhattan's famous Greenwich Village received assurance of protection from the onslaught of modernization as the result of the announcement by a building syndicate of plans to erect a skyscraper apartment on the corner of Fifth Avenue and Washington Square. As the result of numerous protests, the Planning Commission moved to alter use districts so as to protect residential sections from business encroachment, and to reduce permissible building heights by close to 50 per cent. While there was some opposition, the changes were generally well received and were finally approved by the Commission on June 7.

FIRE AND POLICE DEPARTMENTS

The impact of the war continued to aggravate the problems of the Police and Fire Commissioners. Fire Commissioner Walsh, in 1944, revoked the three-platoon system with resultant increase in duty for each fireman. Suits were brought to invalidate the action on the ground that the three-platoon system could not be changed except in time of catastrophe resulting from fire or flood. Early in the year, the courts upheld the Commissioner, and the extra duty was continued for the remainder of the year.

The year 1945 saw the retirement after ten years in the office of Police Commissioner Lewis J. Valentine. A career man, having started as a patrolman, he had brought the department to an acknowledged high level of efficiency, but had been unable to maintain that level because of depletion of his force under the impact of selective service and increased retirement of those eligible for pensions. He retired to become associated with a radio program dealing with crime and criminals, and was succeeded by Wallender, another patrolman risen from the ranks.

With the end of the war the new Commissioner was faced with a startling increase in crime. Homicides nearly doubled over the comparable period of 1944, while felonies jumped from 2,287 to 2,740 for the first ten months of the year. There was little doubt that the shortage of police personnel was an important factor in this increase in crime. The force was short of its authorized strength by over 4,700 men. Commissioner Wallender took a number of emergency measures to meet the situation. Detectives doing routine paper work were sent out on patrol; uniformed patrolmen serving special tours in the early pre-dawn hours were directed to use private cars and wear civilian clothes; expert marksmen on regular patrols were assigned to motor squads; and flying squads were set up to suppress hoodlums. Hurried preparations were made for new examinations to be held in January, strenuous efforts were made to turn the attention of returning servicemen to the prospects offered by police work, and the Mayor announced that all who had passed a civil service examination, but had been called into service before taking the physical, would be appointed immediately on application.

NEWSPAPER STRIKE

In company with the rest of the nation, New York was seriously inconvenienced by the increasing conflict between management and labor. In July, New Yorkers were confronted with the necessity of doing without their daily newspaper as the result of a strike by the Newspaper Deliverers' Union. The Union demanded primarily a welfare fund of three per cent of the payroll and a clause in the contract providing that the question of wages could be reopened. The strike, which tied up the distribution of all papers but one, lasted for 17 days, ending with a series of telegrams between union, publishers, and the WLB. The Board retained jurisdiction over the dispute but agreed to the use of other arbitrators in a number of issues, a prime demand of the strikers.

ELEVATOR STRIKE

In September thousands of the city's elevators were grounded for six days by a strike of the operators, affecting some 2,000 buildings in midtown and lower Manhattan. It was estimated that 1,500,000 persons were prevented from working, notably in the financial district and the midtown garment center. It was estimated that the garment workers lost $3,500,000 in wages, the employers another $12,000,000.

LONGSHOREMEN'S STRIKE

In October, the port of New York was completely paralyzed by a strike of 30.000 longshoremen which continued for 18 days. Although matters of wages and hours were involved, the underlying cause of the battle was a rebellion of the rank and file of the union against the leadership of Joseph P. Ryan who has a lifetime job as president of the AFL longshoremen's Union. The men refused to go back to work on terms agreed to between Ryan and the owners, claiming that Ryan had made no real effort to effectuate their demands. Superficially, Ryan would seem to be the victor as the men finally returned to work without getting assurance that he would back their demands in the future. The causes for resentment remained and were expected to flare up again.

THE BATTLE OF THE BUDGET

In 1944, the Mayor was able to produce a budget which permitted a ten-point cut in the tax rate and emphasized that a still larger cut could have been made if the legislature had been willing to comply with requests for additional taxing power or a larger share of state funds. In 1945, the final results of the Mayor's appraisal of the city's fiscal picture provided a rise in his budget totals—$759,266,401, an increase of almost $21,000,000. The largest share of this, some $19,000,000, was accounted for by wage rises, cost of living bonuses, and pay adjustments for thousands of employees. This rise reflected a general trend toward increasing governmental costs throughout the country.

Anticipating an increase in the general fund, into which funds from the state are paid, the Mayor anticipated another decrease in the tax rate of approximately eight points under the current rate of $2.74. It has been the custom of the Board of Estimate to accept the Mayor's figures with only minor alterations. In 1945, however, LaGuardia was astounded and outraged by a revolt in the estimate body. Comptroller McGoldrick and the Fusion Borough President of Manhattan joined the Democratic borough presidents in voting for a substantial increase in the budget—better than $4,000,000, the final figure being $763,213,014. The largest part of the increase went for an increase of the cost-of-living bonus for city school teachers to $350, instead of the Mayor's figure of $240.

The Mayor bitterly denounced the action of his former allies, intimating that political ambitions in an election year were largely responsible. With the breach between the Mayor and Comptroller thus widened, McGoldrick's chances of obtaining the designation as a mayoralty nominee were considerably lessened. In its customary fashion the Council engaged in vigorous criticism of the Mayor's fiscal policies, then accepted the revision of the Board of Estimate without further change.

SUBWAY PROBLEMS

In 1945, the fiscal condition of the city subway system continued to be a thorn in the Mayor's side. A decrease in the gross operating revenue brought the annual deficit of the system, which must be met by the city treasury, above the $50,000,000 mark. In addition, it was painfully evident that huge amounts would have to be spent after the war merely to restore the system to decent operating conditions. The same groups, headed by the Committee of Fifteen and the Citizens' Budget Commission, which had urged an increase in the five-cent fare in previous years, once more returned to the fray, pushing for passage at Albany of their proposal for an independent Transit Authority empowered to charge a sufficient fare to make the system self-sustaining.

In reply, the Mayor proposed an increase in the sales tax, the additional amount to be applied solely to subway financing. As 1945 was an election year, it was not to be expected that either the sales tax or the fare increase would receive sufficient support to be passed by the legislature. Thus an increasingly aggravating problem, which, so far, has defied solution, was left on the doorstep of the Mayor-elect. Additional funds for subway operation will either have to be diverted from other city services or new sources of revenue explored and accepted at Albany, as there are definite limits on the power of the city to increase the tax load on real estate.

MUNICIPAL POLITICAL TRENDS

By Alfred Willoughby

Executive Secretary, National Municipal League

GENERAL

In the municipal elections of 1945 the American voter provided a widely varied and confused picture of the sovereign citizen. In New York and Boston he restored to power political organizations which had long been labeled "spoils machines," while in New Orleans, where independents never had had a chance and would not, according to local legend, until it snowed on election day, the last surviving henchman of the Huey Long machine was driven out. (It snowed in New Orleans on election day, and that was a miracle, too.)

The Political Action Committee which had been widely heralded as an emerging influence of great weight, fared spottily in its program of seeking local issues with which to keep its new political strength "in training." The organization's weight was partially responsible for the revolutionary change in New York but it was rebuffed in Detroit and Toledo.

Political observers considered significant, however, from the standpoint of its effect on the 1946 Congressional elections and the 1948 campaign, the continuing alliance between Democrats and P.A.C. in the metropolitan centers.

DETROIT

Organized labor's bid for political power in Detroit, center of automobile production, was turned down for the third time by the voters when Richard T. Frankensteen, vice president of the United Automobile Workers, CIO, was defeated by 57,000 votes in his campaign to supplant Mayor Edward J. Jeffries, who had served three terms.

Mayor Jeffries repeated his performance of two years previous by coming out from behind after having been badly defeated in the primary. The campaign was the most bitter and abusive in Detroit's history.

The old and respected tradition of non-partisan local elections emerged from the campaign in a somewhat battered condition, with the Democratic party openly espousing Frankensteen and making considerable point of his record as a party member. Openly, the Republican party remained neutral. The Citizens League, which, while non-partisan, reserves the right to pass judgment on candidates for any local office, endorsed Mayor Jeffries for the fourth term, as did the American Federation of Labor.

It was the most determined bid for local power made anywhere by the Political Action Committee of CIO, which was reported to have poured $100,000 and the efforts of many trained workers into the campaign.

BOSTON

The metropolis of New England provided a demonstration of democracy at work which seemed logical enough to its citizens but which puzzled people elsewhere when it elected Congressman James Michael Curley as mayor despite the fact that a Federal indictment for using the mails to defraud was pending against him.

After his election, Mayor Curley was convicted of using the mails to defraud while participating in a war contracts brokerage racket, but he observed that he saw no reason for resigning his position while his appeal from the conviction was pending. Neither, apparently, did anyone else whose voice could be heard in Boston.

Curley's victory was owing in part to his great popularity in Boston, large elements of which had stuck with him during previous public service in which his conduct had been under fire. He had been mayor twice before, governor of Massachusetts once, and had had four terms in Congress. His election also demonstrated that a popular candidate with a well-organized machine can win with a badly divided opposition. His five opponents shared a clear majority of the votes, 132,370 to Curley's 112,868.

Mayor Curley, who is 71, promised a "monumental and constructive administration." He announced himself as unalterably opposed to the adoption of the council-manager plan for Boston which was proposed as he was taking office.

NEW ORLEANS

The last lieutenant of the Huey Long machine in Louisiana was driven from office early in January, 1946, when Mayor Robert S. Maestri of New Orleans was defeated by deLesseps S. Morrison, a 33-year-old veteran of the Second World War.

The election of Col. Morrison, who went into the Army as a second lieutenant and at 33 emerged as a colonel, was the major political surprise in municipal affairs. He was still in service when a group of "reformers" drafted him as their candidate. The campaign of the Independents was particularly notable in its effort to attract the women's vote. Shying away from the temptation to rest its campaign on gambling and similar delinquencies of the gay southern metropolis, the Independents concentrated on the inefficiency and the political spoils methods of the Maestri machine.

Col. Morrison, son of a former state prosecutor, worked his way through the Louisiana State University law school. After practicing law briefly he served as a state legislator before entering the Army.

TOLEDO

The Political Action Committee was resoundingly rebuked when it attempted to bring about the repeal of the proportional representation method of electing Toledo's city council. The vote upholding P.R. was 38,444 to 21,429, indicating, in view of the known opposition to P.R. by some other groups, that P.A.C. failed to deliver its own enrolled members on the question.

P.A.C. had proposed to substitute election at large, without a primary, which, it was charged by opponents, would have tended to enable a well-organized minority to gain full control of the city instead of providing representation in proportion to actual voting strength as in the past.

ALBANY, N. Y.

The O'Connell machine in Albany, which had been steadily under attack by Governor Thomas E. Dewey for five years and under state investigation for two years, retained control of the capital city in a Democratic landslide, Mayor Erastus Corning defeating Republican Harold J. Murphy by a plurality of 35,000.

PITTSBURGH

In a bitter campaign, David L. Lawrence, Pennsylvania state Democratic chairman, was elected mayor of Pittsburgh with the added backing of labor and other left-wing groups. Long a power in his party, Lawrence had served as its chairman for Allegheny county, as internal revenue collector for western Pennsylvania, and as secretary of the commonwealth. It was under his leadership of the party that George H. Earle was elected governor, the first Democrat to hold that office in Pennsylvania in some 40 years.

BRIDGEPORT, CONN.

Socialist Jasper McLevy, mayor since 1933, was re-elected by a vote double the combined vote of his Republican and Democratic opponents.

PRINCETON, N. J.

The home town of Princeton University lost its long held distinction of having a political science professor as mayor when Charles R. Erdman, Jr., Republican and now commissioner of the State Department of Economic Development, was defeated in his bid for a sixth successive term by Minot C. Morgan, Jr., Democrat, head of the Bureau of Student Employment at the University.

MUNICIPAL FUNCTIONS

By Herbert A. Simons
Associate Professor, Illinois Institute of Technology
and
Dorothea Pye Simons
Editorial Assistant, *The Municipal Year Book*

GENERAL

The sudden surrender of Japan in August, 1945, unexpectedly catapulted American cities from war to a postwar status. Perhaps at no previous time have cities been forced to redirect their objectives and their programs so suddenly and so drastically. In most respects, the problems with which cities found themselves confronted were not new problems, but problems which had been deferred for four years by the urgency of war needs. Among the old problems, now revived, are the tasks of preventing the spread of urban blight in great metropolitan centers and restoration of areas already blighted, of securing some kind of coordinated municipal government for such areas, of providing cities with a flexible, adequate revenue base; and of staffing our city halls with competent, wide-awake personnel capable of dealing with the complexities of modern administration.

WARTIME RECORD OF CITIES

On the bright side of the picture at the end of 1945 was the magnificent wartime record of the cities in maintaining essential services, and their improved financial condition owing to increased assessed values, the availability of new revenues, and the decrease in indebtedness.

The war period was, for the cities, a period of steady depletion of manpower and physical plant. Neither men nor materials were available for adequate maintenance and renewal of streets, parks, sewers, public buildings, or other facilities. In spite of this, cities continued during 1945 to maintain acceptable levels of public service and to carry the heavy burdens placed on them by new wartime industry.

Localities like Willow Run, Richmond, Calif., and Hampton Roads, Va., which four years earlier had faced apparently insuperable problems of providing for new populations, in every case had met these problems—at an emergency level, to be sure—and were now reassessing the situations in which the war had left them, and were preparing to return to a peacetime basis. At the end of the year, most cities were filling vacant positions rapidly with returning veterans and were getting under way their long-deferred maintenance programs. A large number of cities had anticipated and planned these programs during 1944 and 1945, and were now delayed only by the continuing shortages of labor and materials.

Municipal finance continued during 1945 to be one of the brightest parts of the whole municipal picture. A large number of the cities which were legally able to do so continued their far-sighted policies of maintaining tax rates with only slight reductions, reducing bonded indebtedness, and building up reserves for deferred maintenance and post-war construction. They were aided in this, in several states, by state legislation legalizing such reserves. State legislatures took an unusually liberal and enlightened attitude toward the revenue needs of their cities. Sharing of state-collected taxes was expanded in at least six states—Iowa, Pennsylvania, Michigan, South Carolina, New York, and South Dakota. Impressed by the substantial revenues obtained from the New York City sales tax and the Philadelphia income tax, a number of cities were asking for power to levy such taxes. Baltimore received a broad grant of discretionary taxing power from the Maryland legislature. Cities continued to experiment with a variety of minor tax sources which, however, were largely of doubtful usefulness from the standpoint of revenue yield and fiscal advisability.

Public works planning, already fairly well advanced, was aided by a substantial grant of Federal funds to assist governmental agencies in planning and blueprinting their post-war construction projects. These grants are to be repaid to the Federal Government when the projects reach the construction stage. Continued material shortages have given the cities an extension in the time available to complete these plans.

POST-WAR PLANNING AND PERFORMANCE

In spite of the very hopeful developments just enumerated, the situation of our cities at the end of 1945 left no room for complacency. The slogan of "post-war planning," which echoed from every meeting room during the year had far outstripped the activity of post-war planning. The sudden end of the war found the plans of most cities far from the stage of development they will have to reach if they are to exercise any substantial influence on post-war programs. Most progress had been made on plans for post-war public works; far less progress had been made on plans for urban reconstruction and governmental reorganization, and over the whole scene was cast the dark shadow of an unprecedented housing emergency that will require immediate action, regardless of whether plans are available for guiding this action wisely.

Comprehensive city plans and plans for redevelopment of urban blighted areas present a picture of general unpreparedness for any vigorous program of urban reconstruction. Even here, substantial progress must be admitted if comparison is made with the situation that existed 10 or 15 years ago, for each year more cities have been added to the list of those that are appropriating substantial sums to city planning agencies. The two great weaknesses are, first, the large number of cities which do not yet have comprehensive plans, and, second, the large gap that still exists, and that has hardly been narrowed, between the recognition by planners of the kind of reconstruction that is needed and the legislative and financial tools that are available to bring about this reconstruction.

Almost half the states now have on their statute books urban redevelopment laws designed to attract private capital to the task of reconstructing blighted areas, but there had been no noticeable rush of investment capital to make use of these laws; indeed, by the end of 1945 only two projects had been undertaken. Even if greater activity develops here, it is generally recognized that the greatest part of post-war residential construction will take place on the outskirts of the cities, and that, though existing subdivision regulations may in some places secure adequate neighborhood design of these new developments, there are no adequate controls over their locations nor any means available to prevent (if it is desirable to prevent it) the continued dispersion of cities, and the consequent rotting of their central cores.

The seriousness of the last named problem—the decline of the central city—was accentuated during 1945 by the lack of any substantial progress toward the integration of governmental organization in metropolitan areas. There was one hopeful sign during the year, attributable to Federal activity rather than local initiative. The Federal Government in its new program of aiding through highway construction in urban areas was insisting on the development of integrated highway plans for whole metropolitan areas as a condition for the approval of grants.

The seriousness of the housing problem was emphasized by the appointment, at the end of 1945, of Wilson Wyatt, former mayor of Louisville, as an emergency housing "czar," and by the introduction into Congress of the comprehensive Wagner-Ellender-Taft Housing Bill. Quite aside from the pre-war problem of eliminating substandard housing, the country was faced with the prospect of an absolute shortage of housing which, it is estimated, will reach 1,500,000 or 2,000,000 units by the end of 1946. It did not appear hopeful, as 1945 ended, that the emergency housing which would be needed to meet this problem could be carried out with any great regard for long-term housing, planning, and urban redevelopment needs and standards.

PERSONNEL AND ADMINISTRATION

Continued manpower shortages and steadily rising salary schedules characterized the municipal personnel picture in 1945. The year recorded a number of advances in personnel administration. Position-classification projects were completed or in progress at the end of the year in 11 cities and three states. Four cities and five states had adopted or revised their pay plans. Special training programs were instituted for policemen in five cities, training in telephone techniques in two cities. San Diego set up a comprehensive training program for municipal employees with a full-time training officer.

Nine states adopted statewide retirement systems for municipal employees, bringing the number of states with such systems to 22. A number of other states amended their retirement laws to increase coverage and benefits. Eleven cities adopted retirement plans, of which two covered only firemen and policemen. In eight cities and four counties local legislation was adopted establishing or extending civil service systems.

Court decisions on personnel matters were concerned chiefly with labor unions and the employment rights of returning servicemen. A number of decisions were handed down on the power of cities to bargain collectively with labor unions, holding contracts illegal, but permitting check-off of union dues with the consent of the individual employees. The courts were still feeling their way at the end of the year in the delimitation of the re-employment and pension rights of servicemen. One decision held that a veteran who could not pass the physical examination for his previous position was not eligible for re-employment.

FINANCE

The most important developments in municipal finance during the year have already received attention. One result of the favorable financial picture was the reduction of aggregate state and local debt during the year from about $17,500,000,000 to $16,500,000,000.

Legal problems were encountered in determining the scope of tax liability of Federal war industry properties. Much property was restored to the tax rolls by its transfer to the Reconstruction Finance Corporation which, by statute, is not tax exempt; but the Surplus Property Administration was selling property on time payments, and retaining title so that exemption would continue until final payment is made. The courts continued to broaden the liability of persons within Federal areas to state taxation and the power of the state to regulate them. The Minnesota "home port" tax on airlines brought about a Civil Aeronautics Board report on taxation of airlines that foreshadows an important new Federal policy toward state taxation of interstate commerce. The basic proposal of this report was that the Federal Government permit state taxation of airlines only on the basis of a Federal formula for allocating property values among the various taxing states.

Most states enacted enabling legislation under which municipalities could purchase Federal surplus properties without following the usual advertising and bidding procedures; but the experience in purchase of surplus properties was disappointing because of the failure of the Federal agencies to observe fully the governmental priorities established in the act.

PLANNING AGENCIES AND HOUSING

Some of the most important planning developments of the year have already been reported. Generally, the picture of planning organization was an encouraging one. A number of metropolitan areas, though lacking a governmental structure that will permit a coordinated solution of their problems, have set up official or unofficial metropolitan planning agencies as a prelude to voluntary cooperation. County planning agencies continued to increase and to strengthen their programs, and there was a notable increase during the year in the budgets of city planning agencies. In general, organization for planning was making more rapid progress than the acquisition of powers needed to implement plans.

Airport zoning received considerable attention during the year, 17 states adopting airport zoning acts that followed, in general, the Model Act. They were in the form of enabling acts which permit cities to adopt zoning regulations. The power of cities to acquire airport sites by exercise of the power of eminent domain was upheld by the courts. A legal problem that was just beginning to confront cities at the year's end was that of recovering from wartime variances in zoning laws that had been permitted for the location of temporary war housing and industry, and to allow more intensive use of available housing facilities.

Little action was taken by cities during the year to ward off the impending housing shortage. The Wagner-Ellender-Taft Bill, introduced into Congress, would establish a unified national housing agency, authorize urban redevelopment programs, expand the low-rent housing program, and provide for the disposal of permanent war housing. It makes extensive provision for aid to public, cooperative, and private housing projects, and permits war housing to be turned over to local housing authorities for low-rent housing purposes.

RECREATION AND WELFARE

Enabling acts for recreation in designated classes of cities were passed in four states and amended in a fifth. Recreation commissions or departments were set up in 39 cities and two counties, and new park departments in three cities.

With the end of hostilities, interest in recreation centers for "Teen Age" groups began to subside, while attention turned to programs in housing projects. Camping facilities were crowded to capacity. Recreation appropriations continued to increase. New mileage taxes were voted or increased in 14 cities, and large improvement bond issues approved in six. There was renewed interest in methods for securing the voluntary or mandatory dedication of recreation space in new private subdivisions.

Relief caseloads began going up in July and August for the first time since the war began. The increase was owing chiefly to ageing persons and mothers leaving employment, and returning servicemen. Expenditures increased much more rapidly than caseloads in an endeavor to keep up with rising living costs. Only a few local governments had increased their welfare appropriations in anticipation of the larger rolls. The reception and care of repatriated citizens from war theaters was an important service performed by local agencies with Federal funds. The chronically ill became a serious problem with the crowding of hospitals by acutely ill patients. There was extensive state legislative action in the welfare field during the year, mostly concerned with the strengthening and expansion of existing programs.

EDUCATION AND LIBRARIES

The end of 1945 witnessed the first stages of a back-to-school movement of huge proportions. The brunt of this, of course, falls upon the colleges, which are already deluged with veterans who wish to take advantage of the educational benefits to which they are entitled. An equally important, but less dramatic, return of students was taking place at the high school level, where efforts were being made to bring back to school the youth of 14 through 17 years of age who had left school during the war to take jobs. The shortage of well-prepared teachers continued to be an acute problem, particularly in the school districts which pay low salaries.

The need for increased state support of education was recognized in many states by legislative action during 1945. There were no new legislative developments in Federal aid to education, although proposals continued to be heard of a program of Federal grants to the states for primary and secondary education. Three states established new retirement systems for teachers, and four other states amended their teacher retirement laws.

Special library war information services were succeeded by services providing information on demobilization and reconversion as the year ended. Library expenditures continued upward, in part because of salary increases. State aid appropriations generally increased, and were available for the first time in four states. Municipal reference libraries or branches were established by several cities.

LOST OPPORTUNITIES

With due regard to the brighter side of the picture, the year 1945 might fairly be called a year of lost opportunities. The tremendous activity that is anticipated in the construction industry in the next few years presents cities with an opportunity they have not had since the early 20's to make over completely their physical structures and to wipe out the unhealthy social conditions that have been inherited from the unplanned development of the past. It appears now that a large part of this opportunity will be lost, first because many cities, especially the rank and file of their inhabitants, still do not have an understanding of the meaning of comprehensive city planning; second, because few cities have brought their plans anywhere near to completion; third, because the legal base for implantation of the plans is largely lacking; fourth, because there has been little progress in metropolitan organization; and fifth, because even the planning of post-war public works was delayed too long and was not integrated with general city plans. Only the most vigorous and far-sighted action can recover even a part of this opportunity.

In another area, too, 1945 witnessed the loss of an important opportunity. With large numbers of municipal positions to be filled, few cities had taken any positive steps to modernize their recruiting and other personnel practices so as to attract to the public service a fair share of the best talent among returning veterans and displaced war-workers. Again, the long-term picture of the past ten years shows a steady growth of the merit concept and modern personnel methods in cities, but most of them are still far short of any acceptable goal, and there was little evidence during 1945 of substantial acceleration of this progress.

Perhaps it is too much to expect a nation that is engaged in a colossal life-and-death struggle to give adequate thought to its long-term needs. Certainly it would have been unthinkable for any efforts to have been diverted from the war to fill these needs; but the inability to meet them at once should not have prevented planning sufficient to anticipate the problems that would have to be faced when the war was won. The events of 1945 illustrate that the thinking organisms of our administrative structures have not been sufficiently developed to direct efforts to a broader task than that of meeting successive emergencies.

LOCAL SELF-GOVERNMENT AND FEDERAL LEADERSHIP

A general review of the overall picture leaves the impression that, where striking gains were made on any wide front during 1945, they were produced under Federal leadership rather than by activity initiated at the state and local levels. Self-improvement of municipal governments has to be counted in tens and dozens of units each year, although the cumulative effect of these over a period of years is, of course, impressive.

There are a number of reasons that help to explain this. There is such a multitude of local units, they are so poorly coordinated over urban areas, they are so badly hemmed in by restrictive state legislation and the lack of discretionary powers, their capacity of self-help is strictly limited. Moreover, since the depression, both state and local governments have had to look increasingly to Washington as almost the sole source of revenue adequate, in scale and flexibility, to carry on these new activities. Since part of the remedy lies with state legislatures, it is encouraging that they have shown a more favorable attitude toward local revenue and planning problems during the year. It is less hopeful, perhaps, that state planning in a number of states has at the same time turned in the direction of inducing industries to locate within the state borders and has continued to neglect the problems of overall social, fiscal, and administrative planning.

DIVISION VI

TERRITORIES AND SPHERES OF AMERICAN INFLUENCE

ALASKA

By Ernest Gruening
Governor of the Territory of Alaska

HISTORY

American history of the Territory of Alaska can be said to date from 4:00 A.M., March 30, 1867, when the Treaty of Purchase was signed by Baron de Stoeckl for Russia and Secretary of State Seward for the United States. This treaty was proclaimed by President Andrew Johnson June 20, 1867, whereby the United States acquired from Russia the title to the Alaska area of approximately 586,400 square miles for the sum of $7,200,000. The appropriation for this purchase was made July 14, 1867, and the formal transfer took place at Sitka, Oct. 18, 1867. Secretary of State William H. Seward was severely criticized for what was termed "Seward's Folly."

GOVERNMENT

The bill providing for civil government in Alaska was introduced in the United States Senate in December 1883; it was passed by that body in January 1884, and by the House of Representatives in May 1884, when it was signed by President Arthur and became a law. The Territory of Alaska, as such, was created in 1912, by the passage of what is known as the Organic Act. At the present time, the local legislature of Alaska, which meets for a period of 60 days biennially beginning with the second Monday in January of uneven years, is composed of 16 senators and 24 representatives. The Governor is appointed by the President, subject to ratification by the Senate of the United States. A delegate elected every two years represents the Territory in the Congress. He may prepare and introduce legislation, act as a member of committees, but has no vote.

AGRICULTURE

The Alaska Rural Rehabilitation Corporation, with headquarters in Palmer, has general administration over approximately 140 farms and a total land area of 12,000 acres, of which 7,500 acres are under cultivation. The Corporation aids in the development of agriculture in the Matanuska Valley by maintaining reserve and emergency supplies of seed, hay, and fertilizer, by clearing land, and by making production loans to responsible farmers at a low rate of interest. During 1945 the continuing large demand for farm products and the high prices paid to farmers resulted in a large acreage being planted with vegetables, such as potatoes, cabbage, head lettuce, and celery, and with field crops, such as oats and peas for hay and silage, and barley, wheat, and oats for grain. During the 1944 crop year, 2,130 tons of potatoes were marketed, 80 tons of cabbage, 31 tons of celery, 6,500 crates of head lettuce, as well as many other kinds of vegetables. About 1,800,000 pounds of milk were supplied, chiefly to meet the civilian and military demands of the vicinity of Anchorage.

The Seventeenth Territorial Legislature created a Territorial Department of Agriculture, headed by a Commissioner of Agriculture, with headquarters at Fairbanks, for the purpose of promoting and developing the agricultural industry in Alaska, including such fields as horticulture, dairying, cattle raising, fur farming, the preparation and dissemination of information relating to agriculture, the regulation of the entry and transportation within the Territory of plants, seeds, vegetables, animals, etc., in order to prevent the spread of pests and diseases, and to study the marketing of agricultural products within the Territory.

Agricultural Experiment Stations are maintained at the University of Alaska, in Matanuska Valley, and at Petersburg, the latter being an experimental fur farm. Some of the research projects conducted during the year were the raising of swine and poultry, plant breeding, growing oats and peas for ensilage, raising dairy calves on locally grown grains, and wintering sheep. The Agricultural Extension Service is closely allied with the Agricultural Experiment Stations. During the year special emphasis was placed on the production, preservation, and conservation of foods.

EDUCATION

The Territorial public schools are of two classes: schools within incorporated cities and incorporated school districts, and rural schools located outside incorporated cities and school districts. During 1944-1945, 37 rural and 18 city schools, employing 320 teachers, were maintained; 5,794 pupils were enrolled. The public high schools at Anchorage, Cordova, Douglas, Fairbanks, Juneau, Ketchikan, Nome, Petersburg, Seward, Sitka, Skagway, and Wrangell, also the rural high school of Palmer, the Sheldon Jackson School at Sitka, and the Wrangell Institute at Wrangell, are accredited by the Northwest Association of Secondary and Higher Schools. High schools accredited by the Territorial Department of Education are maintained in the incorporated cities of Craig, Haines, Kodiak, Nenana, and Valdez, as well as in connection with a number of rural schools. The Territorial schools are under the general supervision of a Territorial Board of Education, with the Commissioner of Education as executive officer. Graduation from a three-year standard normal school or its equivalent is a prerequisite for the elementary teacher's certificate in Alaska. High school teachers must be graduates of standard four-year colleges and must have completed a minimum of 15 semester-hours of education.

The University of Alaska has completed its 23rd year as the only institution of higher education in the Territory. Although enrollment has decreased in some classifications, the addition of night classes to the regular schedule has maintained the total registration figure at a fairly constant level. Enrollment figures for the year totaled 1,025, comprising 231 students of college grade, 735 mining extension students, and 59 in special short courses.

The Office of Indian Affairs maintained 115 day schools and three vocational high schools with a total enrollment of 5,388 elementary school pupils and 451 high school pupils during the school year 1943-1944.

FINANCE

Cash on hand in the Territorial Treasury July 1, 1945, amounted to $1,407,844.25, as compared with $1,753,034.73 the previous year. The combined resources of territorial and national banks at close of business June 30, 1945, were as follows: Capital $1,035,000, surplus and undivided profits $2,208,408.27, deposits $55,331,987.10. Totals for the previous year were: capital $985,000.00, surplus and undivided profits $1,836,349.64, deposits $54,769,659.79.

FISHERIES

The total value of the Alaska fishery products in 1944 was $63,270,100, a reduction of $3,246,217 over the preceding year. Products of the Alaska fisheries in 1944 amounted to 331,135,017 pounds as prepared for market. In 1944, the salmon canning industry was operated in accordance with the Salmon Industry Concentration Plan, promulgated by the Secretary of the Interior on March 3, 1943, which concentrated in the more efficient plants the entire salmon canning operations, achieving savings in manpower, equipment, and critical materials, and eliminating some burden on shipping facilities. The total number of salmon of all kinds taken in 1944 was 72,429,162 as against 85,846,723 in 1943. The number of cases packed was 4,893,059 valued at $51,196,140, as compared with 5,428,269 cases valued at $57,823,679 in 1943. Ninety-three canneries were operated, 10 more than in 1943, and the number of persons engaged in salmon canning decreased from 19,143 to 19,079. Seventeen herring plants operated; the number of employees increased from 543 to 710, of which 237 persons were also engaged in other fishery operations. The total value of herring products was $2,458,170, an increase of 34 per cent over 1943. The value of halibut landings at Alaskan ports totaled $4,656,817 as compared with $2,649,432 in 1943.

FORESTS

The Chugach National Forest, located in the Prince William Sound region and Kenai Peninsula, and the Tongass National Forest covering the greater part of southeastern Alaska, comprise the National Forest System of Alaska. Their combined area is 20,850,000 acres. All national forest resources are available for use. Standing timber can be purchased and removed for use by local industries and individuals under specified forestry restrictions. Land classified as chiefly valuable for agriculture, mining, industrial enterprises, and townsites can be patented. Areas needed for water power development, fox farming, and other special purposes may be leased. The total estimated timber volume is 84,700,000,000 board feet, and the average volume per acre of the commercial timber stands is about 26,000 board feet. Total gross receipts from timber stumpage and the several classes of land use during the fiscal year 1945 were $101,522.05. Twenty-five per cent of the gross receipts are turned over to the Territory for schools and roads. Ten per cent of all receipts are made available to the Forest Service for road and trail building.

FURS

The take of fur-seal skins from surplus fur seals on the Pribilof Islands under controlled conditions amounted to 47,652 pelts in 1944. The census of the seal herd as of Aug. 10, 1944, showed a total of 2,945,663 animals in the herd, an increase of 8.77 per cent over the previous year. During the fiscal year ended June 30, 1945, two public auction sales of fur-seal skins were held at St. Louis, Mo. during which 45,248 skins were sold. Gross receipts from these sales were $1,635,494.00.

Owing to war conditions fewer trappers were in the field during the past year, but high prices prevailed and thus values were in excess of the previous year's catch. A total of 253,615 pelts of all kinds brought the values up to $2,268,658. At the top of the list were mink, 61,038 skins bringing $671,418; second, 13,352 marten worth $600,840; third, muskrat with 142,500 skins worth $285,060. Other furs ranked in value as follows: Beaver, white, red, cross, blue, and silver fox, otter, lynx, wolf, weasel, coyote, polar bear, wolverine, and black bear.

HEALTH

By action of the 1945 Territorial legislature, the Territorial Department of Health has, for the first time, a full-time Commissioner of Health to direct its work under the supervision of a Board of Health composed of four members. The Territorial Department of Health has five divisions: Public Health Laboratories Division; Maternal, Child Health, and Crippled Children's Services; Communicable Disease Control; Division of Public

Health Nursing; and Division of Public Health Engineering. The United States Public Health Service assists the Territorial Department in formulating sound public health programs in accordance with requirements imposed by the regulations governing the expenditure of Federal funds. The District Director has also been assigned the duties of Medical Director of the Office of Indian Affairs in Alaska in order to assist in coordinating the work of the Territorial Department of Health and the Indian Service.

Tuberculosis remains the major health problem among the natives. Three hundred and nineteen cases of pulmonary tuberculosis were reported to the Indian Service during the fiscal year ended June 30, 1945, bringing the total reported since November 1940 to 1,155. Through an Act of Congress, the Army station hospital at Skagway, Alaska was transferred by the War Department to the Department of the Interior for use by the Alaska Native Service as a tuberculosis hospital. This facility, consisting of 17 buildings and providing 150 beds, constitutes the first significant step toward acquiring the physical facilities required to combat the tuberculosis problem in Alaska.

MINERALS

Before the war, gold mining amounted to over 90 per cent of the total mineral production. Gold production dropped from $26,458,950 in 1940 to $1,725,360 in 1944. Because of the strategic materials needed in gold mining only a few placer mines were given authority to mine during 1944 and then they were under certain restrictions. Throughout 1945, the Bureau of Mines continued an extensive mineral program in Alaska to stimulate the production of metals important to the war, which will also have a favorable effect upon post-war mining in Alaska.

Of particular and timely importance is the discovery of hitherto unvisited oil seeps on the Arctic slope. This discovery has served to stimulate immediate detailed exploration of these seeps by the Navy and other interested agencies as a possible source of petroleum near the anticipated air routes of the future. Other projects now in progress include the investigation of coal deposits, iron and copper deposits on Prince of Wales Island, tin and tungsten deposits on Seward Peninsula and in the Fairbanks area, and tungsten deposits in the vicinity of Hyder. A study of chromite deposits on the Kenai Peninsula proved that Alaska will be able to contribute a substantial tonnage of this ore. The investigation of mercury deposits in southwestern Alaska, particularly around Sleitmut, has led to the production of an important amount of this material.

REINDEER

Reindeer constitute the only agricultural resource in western Alaska, an area about three times the size of Illinois. The Reindeer Service field headquarters are situated at Nome, and the Reindeer Supervisor is directly responsible to the General Superintendent of the Office of Indian Affairs at Juneau. At the close of the fiscal year, June 30, 1944, there were 2,528 native reindeer owners. Approximately 60,000 reindeer graze on 34 main ranges along the west coast between Kodiak Island and Barrow, 39,000 of which are government-owned. Predation, particularly by wolves, has become a very serious problem, at least 30,000 untended deer having been lost in this fashion in the last year. During the year approximately 7,000 reindeer were butchered, having a wholesale value of approximately $150,000.

TRANSPORTATION

The Alaska Railroad furnishes year-around passenger and freight service between Seward and Fairbanks, Anchorage and Whittier, Anchorage and Jonesville-Eska. The changed war situation in Alaska is reflected in a smaller amount of freight and passenger business being handled in 1945 than in 1944. Passengers carried totaled 88,998, an increase of 4,698 over the previous year. Passenger miles totaled 9,275,913, a decrease of 1,605,119 under 1944. Rail line freight hauled totaled 549,248 tons, a decrease of 128,599 over 1944. The revenue from passengers totaled $448,831.85 and the revenue from freight hauled totaled $7,264,574.36.

Alaska is served by five steamship companies: The Alaska Steamship Company, the Northland Transportation Company, and the Alaska Transportation Company of Seattle, the Canadian National Steamships of Vancouver, B. C., and the Canadian Pacific Railway Company of Victoria, B. C. During the year, United States vessels operated by private industry were under the operating control of the War Shipping Administration, and statistics on tonnage and passengers handled are not available.

Commercial aviation is one of the major factors in the industrial life of Alaska. The number of passengers flown during the fiscal year ended June 30, 1945, totaled 53,850; passenger miles flown, 15,847,039; mail and freight carried, 3,824,143 pounds. The Civil Aeronautics Administration has built, and now maintains, 13 major and 21 intermediate airports in Alaska.

HAWAII

By Ingram M. Stainback

Governor of the Territory of Hawaii

GOVERNMENT

Of the 21 islands in the Hawaiian archipelago, eight are inhabited. During the greater part of the nineteenth century the islands formed an independent kingdom, but in 1893 the reigning Queen, Liliuokalani, was deposed and a provisional government set up. In 1894 a republic was proclaimed. Pursuant to the request of the people of Hawaii, expressed through the legislature of the republic, and a resolution of the United States Congress approved July 7, 1898, the islands were formally annexed to the United States on Aug. 12, 1898. The Organic Act under which Hawaii is governed was approved April 30, 1900.

Executive power is vested in the Governor, appointed by the President by and with the advice and consent of the United States Senate. The Hawaiian Organic Act provides that, to be eligible for appointment as Governor, one shall have resided in Hawaii for at least three years next preceding appointment. The Secretary of the Territory, who becomes Acting Governor during the illness or in the absence from the Territory of the Governor, is also appointed by the President by and with the advice and consent of the Senate. There is a Legislature of two houses, a Senate of 15 members elected for terms of four years, and a House of Representatives of 30 members elected for terms of two years.

Hawaii is represented in Congress by a Delegate, elected biennially. He has the right to debate and to be a member of committees of the House of Representatives, but has no vote.

AREA AND POPULATION

For administration purposes the Territory is divided into five counties as follows: City and County of Honolulu, comprising the Island of Oahu (area 604 sq. m.); County of Hawaii, comprising the Island of Hawaii (area 3,030 sq. m.); County of Maui, comprising the Islands of Maui, Lanai, Kahoolawe, and all of Molokai except the leper settlement (area 1,164 sq. m.); County of Kauai, comprising the Islands of Kauai and Niihau (area 627 sq. m.); and Kalawao, administered by the Board of Hospitals and Settlement (area 13 sq. m.). The total area is 6,435 square miles. The principal cities are Honolulu, the capital, situated on Oahu, and Hilo, on the Island of Hawaii.

The non-military population of the Territory reached an estimated total of 502,122 on June 30, 1945, reflecting an increase of 9,743 over the previous year and an increase of 18.6 per cent over the 1940 figure. More than half of the Territory's population was living in the City of Honolulu, the population of which had increased to 261,033, or 45.5 per cent since 1940.

WAR EFFORT

The extent and value of the voluntary and unpaid efforts of Hawaii's citizens in direct aid of the war-effort since Pearl Harbor can not be fairly measured in terms of the limited available statistics. Thousands of men and women, representing every racial element and economic status, worked side by side for the maintenance of the security of the Islands and for the welfare of the armed forces in the Territory. Many thousands served in organizations armed and trained for guard duty and readiness for possible further attacks. Volunteer personnel of the Office of Civilian Defense totaled more than 21,000 persons who, after their regular working hours, trained and kept themselves in readiness to meet any problems which might arise in the event of enemy attacks.

In the Seventh War Loan Drive, Hawaii again exceeded its quotas and retained its record of being the only territory or state that has exceeded every such quota. Total sales during this drive represented 186 per cent of the assigned quota, and Hawaii led the nation in per capita sales.

As of June 30, 1945, inductions into the armed forces totaled 21,520 out of a total of 120,763 registrants in the 18 to 45 group. Voluntary enlistments of registrants totaled 4,095.

A Veterans Council was established by law and was given a generous appropriation for the purpose of providing information, counsel, aid, and assistance to returning war veterans and their families and dependents and coordinating the efforts of other agencies concerned with veterans welfare.

Military government, inaugurated in the Territory on Dec. 7, 1941, and later modified, was finally terminated by executive order of the President on Oct. 24, 1945.

ELECTIONS AND LEGISLATION

The regular biennial territorial and county elections were conducted in November of 1944 without any let-up in the war effort, and showed the largest number of registered voters and the largest vote in the history of the Territory, indicating Hawaii's continuing interest in the processes of free democracy.

The regular biennial session of the Legislature was held in 1945. Of the 300 bills enacted by the Legislature, 277 became law. One of these, sponsored by labor and enacted by the Legislature as the Hawaii Employment Relations Act, extended to the Territory's agricultural workers many of the benefits extended to other workers under the terms of the National Labor Relations Act and other Federal acts. Other 1945 legislation sponsored by the Territorial Department of Labor and Industrial Relations strengthened and broadened the scope of the child labor and workmen's compensation laws. Maximum benefits under the unemployment compensation laws were increased to $25 per week, and higher minimum wages were established throughout the Territory.

STATEHOOD PROPOSAL

On Dec. 22, 1945, the Secretary of the Interior advocated statehood for Hawaii as a part of the territorial policy of the Department of the Interior. In his message to the Congress on Jan. 21, 1946, President Truman urged that Congress accede to the wishes of the people of Hawaii that the Territory be admitted to statehood in the Union.

BUSINESS AND FINANCE

Tax collections for the Territory for the year 1944-45, (exclusive of real property taxes) totaled $33,368,835. The gross income and consumption tax base was $980,758,834. The Territorial Government's operating surplus at the end of the biennial accounting period was $5,043,004. The Territorial sinking fund ended the year with a surplus of $5,422,353.

Bank clearings for the year totaled $1,734,390,481. Internal revenue collections totaled $172,443,854. Collections in Hawaii amounted to $360 per capita, a figure which was exceeded by only nine states. The year's total collections in the Territory exceeded total collections in 14 other states. Gross postal receipts were $21,521,587, as compared with $8,673,187 for the preceding year.

Gross Revenues of the 30 non-governmental utilities operating in the Territory during the calendar year 1944 totaled $37,063,548 which was 58 per cent in excess of comparable revenues for the year 1941. The City and County of Honolulu's largest transportation system carried 224 per cent more passengers in 1944 than in 1941. Electric energy delivered increased 67 per cent, gas delivered was up 65 per cent and telephone calls were up 29 per cent for local calls and 59 per cent for toll calls.

With all inter-island surface transportation facilities in use almost exclusively for military purposes, air transportation of both passengers and freight between the islands increased greatly.

HEALTH AND WELFARE

The substantially good civilian health situation was indicated by a general mortality rate of 5.7 deaths per thousand, "the lowest ever recorded for any state or Territory," in spite of inadequate housing, difficulties in obtaining proper nutrition, and the daily irritations and sacrifices endured by the people. There seems little doubt, however, that the uncomfortable living conditions, with poor facilities for sanitation, under which a large number of the Territory's people had been forced to live because of wartime overcrowding and lack of housing facilities, augmented the spread of tuberculosis and other communicable diseases and contributed to the causes of mental breakdowns. The completion during the year of additional locally financed housing units and marked progress on the Federal Public Housing program promised early relief of this situation. Action by the Territorial Legislature, extending the scope of the Hawaii Housing Authority program, offered the hope of long range betterment of permanent housing conditions.

Although the number of persons receiving direct relief showed a steady decline during the years following the the outbreak of war, broadening of the public assistance programs, increases in allowances to meet increased living costs, and the necessity for meeting special problems arising out of war conditions, brought total expenditures by the Department of Public Welfare to a substantially higher level than existed in 1941.

EDUCATION

Since the beginning of the war, more than 800 public school units (classrooms, cafeterias, gymnasiums, auditoriums, etc.) were turned over to the military authorities of the Office of Civilian Defense. The entire school plant, or a large part of it, was given up in 26 public schools, 8 per cent of which were converted into hospitals. At the outbreak of the war, the staff of the Department of Public Instruction totaled 3,411. Almost one-half of this staff left the service during the war. These factors resulted in over-crowding, and disruption of school schedules. However, the children's morale remained at a high level, and undoubtedly contributed to the high level of community morale under conditions which might well have bred widespread hysteria and unrest. The year 1945 saw the release of some park and school facilities by the military authorities. However, many recreational areas and school buildings were still being devoted to military use.

In addition to their contribution of labor to the production of sugar and pineapples, Hawaii's school children raised more than 3,000,000 pounds of vegetables in school gardens and approximately three times that quantity in home gardens sponsored by the schools, and were given second place among all states and Territories in per capita purchase of war bonds and stamps during the year.

During 1944-45 the University of Hawaii had succeeded in rebuilding its instructional staff from the 1943 low of 77 to a total of 95, compared with the pre-war staff of 123. Student enrollment for credit was 3,500 compared with the pre-war figure of 2,765.

THE FISHING INDUSTRY

Hawaii's fishing industry was virtually eliminated by the war, and therefore sea foods, a highly important element in the pre-war diet of the islanders, had been almost completely unavailable for three years. Poultry, as well as sea foods, has continued to be scarce, thus contributing to a meat shortage which became acute during the year, particularly in Hawaii, but the efforts of the Territorial Board of Agriculture and Forestry to re-establish the industry were beginning to show results.

THE SUGAR AND PINEAPPLE INDUSTRIES

Increasingly acute adult manpower shortages and non-availability of heavy machinery for the extension of mechanization continued to handicap the production of sugar and pineapples. Since the start of the war, sugar cane land in cultivation declined almost 30,000 acres, or about 12 per cent. About one-fourth of these lands was taken for Army and Navy purposes, and the remainder was abandoned because of wartime production difficulties. The diligence of the producers and the strenuous efforts of Hawaii's school children combined to keep the percentage of decline in production at a low figure compared with the percentage of loss of lands and labor. At the close of the year, plans for the importation of 6,000 laborers for these industries were nearly completed.

The 1945 sugar crop was estimated to be 855,000 tons, and shipments to the United States were estimated to be 750,000 tons. The U. S. Agricultural Adjustment Agency, during the year 1944-45, approved payments totaling $8,210,656 to 36 plantation producers, 1,566 adherent planters, and three individual planters for compliance with requirements under the Sugar Act of 1937.

The pineapple pack for the 1944-45 season was 10,164,219 cases of canned pineapple and 7,957,424 cases of juice.

PUERTO RICO

BY MAX A. EGLOFF

DIRECTOR OF INFORMATION, OFFICE OF THE GOVERNOR OF PUERTO RICO

DESCRIPTIVE

Puerto Rico is an island 100 miles long and 35 miles wide, with an area of 3,406 square miles. The capital, San Juan, is approximately 1,400 miles from New York and 1,000 miles from Miami. The island is bounded on the north by the Atlantic Ocean and on the south by the Caribbean Sea.

Puerto Rico is sub-tropical, but trade winds blow continuously from the northeast. As a result, it has a moderate all-year climate, with an average temperature of 73 degrees in summer. Rainfall is generally abundant, although certain sections of the southern coast are so dry that crops in that region must be grown under irrigation.

HISTORICAL

Historically Puerto Rico is one of the oldest parts of Spanish America. Christopher Columbus discovered it on Nov. 19, 1493 in the course of his second voyage. He named it San Juan Bautista (St. John the Baptist). Later it was renamed Puerto Rico (Rich Port), probably because of the exceptionally fine harbor where San Juan is now located. The Indians had called the island Boriquén.

POPULATION

In 1940 Puerto Rico had a population of 1,869,255, or 544.2 persons per square mile. With the exception of some of the smaller islands in the Caribbean, no other place in the Western Hemisphere has so dense a population depending on an agrarian economy. More than 70 per cent of the people of Puerto Rico still live in the rural areas. San Juan, on the north coast, is the largest city, with a population, in 1940, of 169,247. The second and third largest cities are Ponce on the south coast with a population of 105,116 and Mayaguez at the west end of the island with 76,487 inhabitants.

THE LANGUAGE PROBLEM

The island became a possession of the United States in 1898 as a result of the Spanish-American War. Spanish continues to be the mother tongue, although English is taught in the schools. The official language is English, and most commercial correspondence with the mainland is carried on in English. The language problem, however, is still a very serious one, and the attempt to make Puerto Ricans truly bilingual has not as yet succeeded.

GOVERNMENT

The Island is governed under the Act of Congress of March 2, 1917, known as the Organic Act, and subsequent amendments. The Governor, who is appointed by the President of the United States by and with the consent of the Senate, is the executive. He holds office at the pleasure of the President.

The act provides for seven departments—Justice, Health, Interior, Education, Treasury, Agriculture and Commerce, and Labor—and the Auditor's office. The Attorney General, who is head of the Department of Justice, the Commissioner of Education, and the Auditor are appointed by the President by and with the consent of the U. S. Senate. The heads of the Departments form the Executive Council.

Every four years Puerto Ricans elect their own legislature, which is made up of a Senate with 19 members and a House with 39 members. The Island is divided into 77 municipalities. Each municipality has its own mayor and council whose acts are subject to review by the Executive Council. The Resident Commissioner, elected by the people of Puerto Rico, represents the island in the U. S. Congress. He has the right to debate, hold committee assignments, and to introduce bills, but does not have the right to vote.

1944 ELECTION RESULTS

In the elections of November 1944 the Popular Democratic Party under the leadership of Luis Muñoz Marín, which was first organized in 1940, again won—this time by an overwhelming majority in all the seven senatorial districts, and in 75 of the 77 municipalities including San Juan. The Popular Democrats not only gained control of both Houses of the Insular Legislature but elected their candidate for Resident Commissioner, Jesús Piñero.

JUDICIARY

The judiciary system consists of the Supreme Court, the District Court of the United States for Puerto Rico, the district and municipal courts, and justices of the peace. Appeals may be made in certain cases to appropriate higher courts, including the Supreme Court of the United States. The Chief Justice and four Associate Justices of the Supreme Court, the District Judge, District Attorney, and Marshal of the U. S. District Court for Puerto Rico are now appointed by the President. Statutory laws of the United States not locally inapplicable, unless otherwise provided, are in effect in Puerto Rico.

POLITICAL STATUS

Puerto Ricans are citizens of the United States, but since they are not citizens of a state they can vote in Presidential elections only when they have established residence in a state. Puerto Rico has been held by the U. S. Supreme Court to be unincorporated territory of the United States, a status differing from that of those territories which have been incorporated into the Union.

Puerto Ricans generally are dissatisfied with the Island's present political status which they consider "colonial." The Legislature has requested Congress to define alternative statuses—independence, statehood, or a form of dominion status—and to permit the people of Puerto Rico to choose. This plan was incorporated into the Tydings-Piñero bill which was introduced in Congress in May 1945. President Truman has since subscribed to the principle of self-determination for Puerto Rico.

FINANCES

Insular income was estimated at $129,851,737 for the fiscal year 1944-45, 17 per cent less than in the previous year. Of this sum, General Fund collections were estimated at $77,771,936. The decrease of approximately $27,000,000 from the total receipts for the previous year was accounted for primarily by a sharp decline in rum exports which cut U. S. Internal Revenue collections, returned to Puerto Rico, from nearly $64,000,000 to approximately $37,500,000. The income tax receipts amounted to $16,337,586.67. The Insular Public Debt rose slightly during the year, but is still only $13,064,000.

LEGISLATION

The Sixteenth Legislature met first in a special session in January, 1945 to appropriate $16,000,000 for emergency relief to be administered by the Insular Emergency Council.

The first regular session was one of the most active in the history of the Legislature. There were 587 bills passed of which 328 were approved by the Governor. Several new governmental agencies were created including the Agricultural Company to encourage the maximum development of the agricultural resources of the Island ($10,000,000), the Aqueduct and Sewer Service to build and operate public aqueducts and sewers ($3,500,000), the Coffee Insurance Corporation in the Department of Agriculture and Commerce ($5,000.000) and the Puerto Rico Labor Relations Board.

The Legislature also passed a Joint Resolution requesting Congress to define the forms of political status "that Congress may be disposed to grant upon approval of any of them by the People of Puerto Rico." This Resolution led to the introduction of the Tydings-Piñero bill in Congress.

THE ECONOMIC SITUATION

Scarcity of land and an ever-growing population have created a critical economic situation in Puerto Rico. There are only 1,000,000 acres of arable land for almost 2,000,000 persons, and the population is increasing at the rate of about 40,000 per year. It has been estimated that in another 20 years the population will have reached 3,000,000.

Puerto Rico is still predominantly agricultural. Despite the small proportion of land to people, almost half of the working population is employed on farms. There are three principal cash crops, sugar, tobacco, and coffee, of which sugar is by far the most important. The sugar cane crop of 1945 was more than 240,000 tons greater than in 1944 with production reaching 963,775 tons. Delayed by a strike at the beginning of the year, the grinding season, which normally ends July 1, continued until mid-August. Tobacco also registered a large increase over the yield for 1944.

The rum industry, which had been greatly stimulated by the shortage of liquor stocks in the United States, started to decline. The value of the rum exports fell from $34,926,156 in 1943-44 to $13,927,413 in 1944-45.

The total dollar value of exports dropped from $133,482,368 in 1943-44 to $116,203,959 in 1944-45. These figures, however, do not reflect a general recession, but rather a marked shrinkage in the sugar and rum shipments.

Insular relief was administered through the War Emergency Program, as a combination of work relief and direct aid. An average of 31,612 persons per month was employed throughout the year on work projects. The WEP contributed $1,500,000 to the Public Welfare Fund of the Department of Health, which made monthly relief payments to an average of 27,797 unemployed people.

INDUSTRIAL DEVELOPMENT

The Puerto Rico Development Company was established by the Insular Legislature in 1942 to promote the industrial development of the island, in the belief that industrialization promises a possible solution to the island's economic problems. The Development Company is authorized not only to help finance private industry, but to establish and manage industries of various kinds on its own behalf.

A glass container factory and a cement manufacturing plant are already being operated by the Company, and a paperboard mill and a ceramic plant will soon be ready to start operating. Other plans under consideration include plants for making wallboard, cotton cloth, food yeast, meat products, shoes, and vegetable oil and shortening.

The Puerto Rico Development Bank, created by the Insular Legislature in 1942, is closely associated with the industrialization program. This bank has three primary functions: (1) to carry on refinancing operations of various kinds; (2) to act as a central institution through which all financial operations of the Insular Government can be managed, and (3) to help finance the long-range industrial development of the island, through the Development company and private business.

LAND USE AND OWNERSHIP

Because the land area of Puerto Rico is so limited, in relation to population, and because land ownership has been concentrated in the hands of a comparatively small group, the question of land ownership and land use is supremely important. The Insular Legislature, in the Land Act of 1941, implemented the Joint Resolution of Congress, adopted in 1900, providing that no corporation or partnership engaged in agriculture on the island may own or control more than 500 acres of land.

The Land Act establishes the Land Authority to purchase land, primarily that held in violation of the Joint Resolution of Congress, and to distribute that land in three ways: (1) in plots of from one quarter cuerda to three cuerdas (one cuerda is slightly less than one acre) to agricultural workers (*agregados*); (2) in parcels of from five to 25 acres to individual farmers; (3) in large farms of from 100 acres and up which are leased to experienced farmers to be operated on a proportional profit basis which provides that the laborers on the farms share in the profits in addition to receiving regular wages for their work.

Up to June 30, 1945, the Land Authority had acquired a total of 43,346.24 cuerdas of land and had distributed 38,290 cuerdas. The average cost of the land purchased was $102.16 per cuerda for land distributed to the agregados, $78.50 for land for individual farmers, and $167.66 per cuerda for the proportional profit farms.

During the year 1944-45 the proportional profit farms distributed $100,000 in profits among 10,000 to 13,000 workers.

AGRICULTURE

Although sugar has always been the chief crop in Puerto Rico, an organized attempt has been made in recent years to turn farmers away from the one-crop system of sugar and the less profitable cultivation of tobacco and coffee to more diversified farming. Special attention is being given to increasing the production of food crops in order to lessen the island's dependence on other countries for its food and to raise the standard of living.

The Department of Agriculture and Commerce is encouraging subsistence farming by distributing seed and fertilizer to farmers. During 1944-45 fertilizer and seeds to the value of $104,215 were given out, and a total of 21,000 acres benefited by this planting program. The production of vegetables increased 22 per cent over that of 1943-44.

Animal husbandry, soil conservation, and reforestation are also being encouraged by the Department of Agriculture.

LABOR

Organizing activity among labor greatly increased during the past four years. At the beginning of the year there were two island-wide labor organizations—the Free Federation of Labor, affiliated with the American Federation of Labor, and the General Confederation of workers, formed in 1940. In the spring of 1945, however, the General Confederation split into two groups and, as of October, 1945, the breach had not been closed.

The strike in the sugar industry, which lasted 36 days and involved 140,000 workers, was the most serious labor dispute of 1945. It was adjusted when the Commodity Credit Corporation raised the benefit payment, thus permitting employers to increase the wages of agricultural workers by 23 cents a day and mill workers by 3 cents an hour.

There were 53 other strikes which involved a total of 5,230 workers. One of these was in the Puerto Rico Communications Authority, and another was at the plant of the Puerto Rico Glass Corporation, a subsidiary of the Puerto Rico Development Company. The latter lasted 86 days.

The Mediation and Conciliation Service disposed of 206 situations involving 352,510 workers. Of these situations, 180 were disputes between employers and employees involving 308,248 workers.

HEALTH

The birth rate of Puerto Rico, already extremely high, rose slightly in the calendar year 1944 from 39.6 to 41 per 1,000 population. The death rate also increased fractionally, from 14.7 per 1,000 to 14.8. Malaria and syphilis were the leading causes of sickness, with diarrhea, enteritis, and tuberculosis the leading causes of death. At the present rate of births and deaths there is a net increase in the population of Puerto Rico of some 40,000 people each year.

The attempt to control venereal disease was continued by the Insular Department of Health during the year. A total of 13,831 cases of syphilis and 5,914 cases of gonorrhea were treated in the clinics and 5,466 cases were treated in the Rapid Treatment Centers. Three Rapid Treatment Centers and four Diagnostic Centers operated during the year.

Although tuberculosis continues to rank second as a cause of death, it has shown a slight but steady decrease from 1940 when the rate was 260 per 100,000 population to 1944 when the rate was 215.4. In addition to the work done at the 20 tuberculosis clinics of the public health units throughout the island there is an X-ray Traveling Unit which reaches places where there are no fixed Units. There are five tuberculosis hospitals with a bed capacity of 1,500.

EDUCATION

Enrollment in the public schools of Puerto Rico increased slightly during 1945. Total enrollment for 1944-45 was 329,000 or 8,000 more than in the previous year. The need for additional school buildings and teachers is acute. Of a total school population of 648,230 less than half are in school and of those who are enrolled approximately 50 per cent attend school for half days only.

The University of Puerto Rico, located in Río Piedras, had an enrollment of 4,250 in 1944-45. It includes colleges of Education, General Studies, Natural Sciences, Engineering, Commerce, Social Sciences, Pharmacy, Agriculture, Humanities, Sciences, and Law. A new School of Public Administration was initiated in September 1945, and schools of nursing and medicine and a Social Research Center are being planned for the near future.

PUBLIC UTILITIES

The Water Resources Authority, an Insular Government agency established to develop the power resources of the island, acquired ownership of the properties of the Porto Rico Railway, Light and Power Company and the Mayaguez Light, Power and Ice Company from the Federal Works Administration in 1944. This purchase concentrated in the Water Resources Authority practically all the power resources of the island. The Authority is now developing water power with the aim of lessening the island's dependence upon imported fuel oil.

PUERTO RICO IN THE WAR

The geographical location of Puerto Rico makes it the most important base in the outer defense system of the Caribbean area. Owing to this fact, the island was the scene of great military activity of the armed forces of the United States. Important air and naval bases were established, and large sums of money were spent in these works.

Although shipping facilities were considerably curtailed in 1942 and 1943 no serious shortages developed, and it was unnecessary to ration any commodities except gasoline and tires. During the fiscal year 1944-45 shipments to Puerto Rico steadily increased to nearly their pre-war level with a total of 833,555 long tons of cargo entering the ports.

Puerto Rican troops saw service on all fighting fronts. In all some 60,000 Puerto Ricans were inducted into the United States Army. The 65th Infantry Regiment operated in Panama, North Africa, Sicily, Italy, France, and Germany, and the 246th Quartermaster's Battalion also saw service in Europe. A Puerto Rican Marine Corps General distinguished himself in the Okinawa campaign.

Puerto Rico gave full support to all the War Loan Drives, subscribing a total of approximately $85,000,000, of which about $50,000,000 were subscribed by the Insular Government.

THE PHILIPPINE ISLANDS

By Richard R. Ely

Special Assistant to the United States High Commissioner
to the Philippine Islands

AMERICAN REOCCUPATION

The liberation of the Philippines was the outstanding event of the year 1945. The campaign which began on Oct. 20, 1944 with the landing of American troops on the island of Leyte was followed by the major landing north of Manila on Lingayen Gulf on Jan. 9. The first American troops entered Manila on Feb. 3; Bataan and Corregidor had fallen by Feb. 28. Before the six-month campaign to free Luzon was ended, many other landings had been made in widely separated areas. On July 9 General Douglas MacArthur announced that "the Philippine campaign can be regarded as virtually closed."

POLITICAL AND GOVERNMENTAL STATUS

The legal status of the Philippine Islands is that of an unincorporated territory of the United States. Under the statutes now in force, complete independence of the Islands is scheduled for July 4, 1946 or sooner if the President of the United States shall so proclaim, and there has been wide speculation as to whether a date prior to July 4, 1946 will be fixed. To clarify the matter, President Truman has stated he does not intend to consider advancing the proclamation of Philippine independence to a date earlier than July 4, until the necessary program for rehabilitation has been worked out and until there has been a determination of the fundamental problems involved in mutual relationship after independence.

The Independence Act of 1934 specifically sets forth the general powers and authority reserved to the United States during the transitory period of the Philippine Commonwealth Government. The public debt may not exceed limits now or hereafter fixed by the Congress of the United States; trade relations with the United States continue to be governed exclusively by Congress; Philippine legislative acts affecting currency, coinage, imports, exports, and immigration do not become effective until approved by the President of the United States; foreign affairs remain under the direct supervision and control of the United States; all acts passed by the legislative body must be reported to the Congress of the United States; decisions of the courts of the Commonwealth Government are subject to review by the Supreme Court of the United States; citizens and corporations of the United States enjoy in the Commonwealth of the Philippines all the civil rights of citizens and corporations of the Philippines. The United States reserves the right to maintain such military and other reservations in the islands as may be deemed necessary for the mutual protection of the Philippine Islands and of the United States.

There is also reserved to the United States the right to intervene under certain conditions set forth in the act. During the period of the Commonwealth Government a United States High Commissioner "shall be the representative of the President of the United States in the Philippine Islands."

In September the Philippine Commonwealth, through President Osmena, ratified adherence to the United Nations charter—the first document of this kind to have been ratified formally by the Philippine Government. The Commonwealth Government was represented at the several United Nations conferences held during the year. It joined the United States as a member of the Far Eastern Advisory Board which held its first meeting in Washington on Oct. 30, 1945.

CITIZENSHIP

Citizens of the Philippine Islands owe allegiance to and are under the protection of the United States but are not citizens thereof. Those who have given honorable service of not less than three years in the United States Army, Navy, Marine Corps, or Coast Guard may become citizens of the United States. As one means of recognizing the loyalty of the Filipino people during the recent war, the 79th Congress took under consideration measures that would greatly extend the privileges of naturalization now granted to Filipinos. For purposes of immigration the Philippine Islands are considered as a separate country, and the number of immigrants that may enter the United States therefrom during each fiscal year is limited to 50.

GOVERNMENT ORGANIZATION—EXECUTIVE

Under the constitution drafted in accordance with the provisions of the Independence Act of 1934, the executive power is vested in the President of the Philippines elected by the Filipino people for a six-year term and ineligible for reelection. By an amendment to the constitution, approved by the President of the United States on Dec. 2, 1940, the term of the President and of the Vice President was changed to four years; the tenure of the President was limited to eight consecutive years. The President controls all executive branches and has general supervision over local governments. He appoints all high officials of the government and all minor officials not otherwise provided for. The President is commander in chief of the armed forces of the Philippines; in emergencies he may suspend the privileges of the writ of habeas corpus or place the Islands under martial law. He has power to grant reprieves and pardons and to remit fines and forfeitures, after conviction, for all offenses except in cases of impeachment.

There are nine executive departments. Three of the 12 cabinet members—the Commissioner of the Budget, Secretary to the President, and Resident Commissioner in Washington—are without portfolio. Since the reestablishment of the Commonwealth Government in Manila, President Osmena has appointed six cabinet members, leaving three vacancies. The Auditor-General is appointed by the President for a ten-year term and is not eligible for reappointment. The Philippine Resident Commissioner to the United States is appointed by the President of the Philippines.

LEGISLATIVE AND JUDICIAL

Under the Philippine constitution, the legislative power was originally vested in a unicameral body called the National Assembly to meet every year in regular session for not more than 100 days. Under an amendment of the constitution, the Congress is composed of a House of Representatives of 98 members and a Senate of 24 members elected at large every six years. The membership of the House of Representatives, apportioned on the basis of population, is elected by popular vote every four years. Special sessions are limited to 30 days.

Because of the Japanese invasion, the Congress had not assembled since 1941. On June 9, 1945 President Osmena called the first Philippine Congress into its first 30-day special session. Of the 98 representatives elected in 1941, 70 were present; 11 had lost their lives during the war; and the remainder were detained under suspicion of collaboration. Of the 24 senators, two had died and seven were under detention. Manual A. Roxas was chosen president of the Senate and José Zulueta speaker of the House.

Close control and supervision over the natural resources of the Islands is given to the Congress. This body is empowered to legislate with reference to public lands, timber, and mining. Prior to 1935, legislation on those subjects required the approval of the President of the United States before becoming effective. Heads of departments may be heard before the Congress. Veto provisions are similar to those in the United States Constitution, except that the President may veto specific items in appropriation, tariff, and revenue bills.

Under the constitution, the judicial branch of the Commonwealth Government is composed of the Supreme Court, Court of Industrial Relations, Courts of First Instance, justices of the peace courts, and municipal courts. A recent Act of the Commonwealth Government provides a People's Court to try accused collaborators.

REHABILITATION

Arriving in central Philippines amid the chaos created by the Japanese occupation, President Osmena found the people hungry and ill-clothed, without necessary medicines, and the school system wrecked. With the battle still going on, he began preparations for restoring order, setting up local governments and opening schools and post offices in the areas freed from enemy control. Nearly 800 of the 1,050 post offices have been reopened. Twice the President returned to the United States to confer with the President of the United States on matters affecting relief for his people.

In May, Senator Tydings, chairman of the Filipino Rehabilitation Commission, established by Act of Congress approved June 29, 1944, headed a mission to Manila to investigate conditions and to consider measures required as a result of destruction wrought by the Japanese, and in July the President sent Paul V. McNutt to the Philippines on a similar mission. All of them returned with stories of great distress. The devastation of Manila was beyond description. Tens of thousands of persons were homeless and without food or medicine; the people were almost solely dependent upon the United States Army for food; living costs in Manila were eight times greater than in pre-war days; inflation and black marketeering were rampant; the large cities and many of the towns were in ruins; the principal industries—sugar, copra, hemp—were ruined. Transportation was paralyzed; the absence of water-craft, motor vehicles, and trucks crippled the entire flow of commodities and goods. Most bridges were destroyed; light, water, and communications systems were almost totally destroyed. The textile mills had suffered great damage. Business and commerce were restricted or liquidated. Filipino members of the Filipino Rehabilitation Commission have estimated that repairing war damage in the Philippines will cost $1,300,000,000. Agrarian unrest, which existed prior to the invasion, was increasing and still constitutes a serious problem.

A beginning has been made to remedy these conditions. The Federal Government has rendered valuable assistance. The Treasury Department set up a temporary Banking Division to meet immediate needs. This has now been closed as no longer necessary. The Army provided free distribution or sale, at ceiling prices, of essential goods. Engineers were drawn from the Army, the Navy, and the FWA to go to the Islands to determine the extent of the damage to roads, bridges, and port facilities and lay plans for their restoration. The War Shipping Administration and the United States Maritime Commission assisted in supplying cargo space to the Philippines and in transferring additional boats for inter-island transportation. The UNRRA has allotted $3,000,000 for emergency relief supplies. The FEA sent a mission to the Philippines to arrange for the procurement of strategic commodities, such as copra, fibers, and sugar, to assist in reestablishing private trade between the Islands and the United States.

The President of the United States showed his interest by directing the heads of the various government departments and agencies to continue their assistance to the Commonwealth Government. One of the first moves resulting from his directive was the appointment of a special assistant to the Attorney General to investigate collaborationist activity in the Islands. The 79th Congress gave special attention to the two most pressing problems confronting the Philippines—the payment of war damages and the post-independence trade relations with the United States. Several measures were introduced to bring about the restoration of normal economic conditions: one which became a law in November would make available to the treasurer of the Islands Philippine funds accumulated in the United States Treasury from the processing tax on Philippine imports. Enemy occupation of the Islands prevented the holding of elections in 1943 and 1945 as provided in the constitution. There is no provision in the constitution for such elections to be held at any other time, and the terms of all the members of the House of Representatives and of two-thirds of the members of the Senate were due to expire on Dec. 30, 1945. To deal with the situation, the President of the United States recommended, and the Congress has passed, legislation providing for national elections not later than April 30, 1946 and for the convening of the newly elected Philippine Congress not later than May 28, 1946.

UNITED STATES HIGH COMMISSIONER

Paul V. McNutt was nominated on Sept. 6 by the President to be United States High Commissioner to the Philippines. His appointment was confirmed by the Senate on Sept. 14. From Sept. 16, 1942 to Sept. 14, 1945, the authority of the High Commissioner was vested in the Secretary of the Interior. On that date the powers and duties of the office were re-transferred to the High Commissioner by Executive Order. Commissioner McNutt had previously served as High Commissioner from Feb. 1937 to July 1939. He left Washington on Nov. 18 for the Philippine Post, and upon arrival enumerated the major problems existing, as follows: Economic rehabilitation and restoration of stable commerce, with emphasis on industrialization of the Islands; physical reconstruction of the war-battered areas; solution of agrarian unrest, stemming largely from absentee landlordism; restoration of a stable currency and elimination of inflation; and punishment of collaborators and unification of dissident elements.

TRADE

No authentic statistical data since the invasion is available. The Islands' economic and financial problems are on the way to solution; normal inter-island commerce and foreign trade are being restored. Prices of a number of commodities, including such important items as rice and cotton cloth, began to decline in July owing to expected arrivals of commercial goods from the United States. In most instances, however, they continue far above established ceiling prices. Arrangements were completed in July for the Philippine Civil Affairs Unit of the United States Army to turn over its stocks of civilian goods in Cebu, Negros, Panay, and Bohol to commercial dealers on Aug. 15 and to make a similar transfer in Mindanao on Sept. 1. Both inter-island and trans-Pacific facilities are improving, but still are far from adequate. The Metropolitan Transportation Service was organized to take over 250 trucks and buses formerly operated by the Emergency Control Administration. The first commercial ship left Manila for the southern islands in June; the second one sailed for Iloilo about the end of July with approximately 600 passengers. An average of 800 civilian passengers and 90 tons of civilian traffic a day was being handled by the Manila Railroad Company at the end of July. The properties of that company are about to be turned over to civilian management.

Under the sponsorship of the War Shipping Administration, several American steamship lines were designated to handle shipping out of Pacific Coast ports. The first civilian ship bringing commercial cargo to the Philippines arrived in Manila late in August. Another arriving in September brought the first commercial export of American textiles, consisting of 6,000,000 linear yards of cotton goods allocated by the FEA. In October a shipment of 2,000,000 tons of Manila hemp arrived in the United States, the first substantial shipment of the fiber since the war. The United States Maritime Commission approved the transfer of 16 coastwise vessels to Philippine registry. The Pasig River has been reopened to traffic. Air transportation will be resumed as soon as airworthy planes are secured. Two local air companies are expected to begin operations in December. The Bureau of Animal Industry opened an office to assist farmers to obtain livestock. The number of carabaos, the universal work animal of the Filipino farmer, is greatly diminished. Only half of a normal sugar crop is expected in the 1946-47 season. Unfavorable weather conditions and damage to irrigation facilities have delayed rice planting. Both sugar and rice are being imported.

The rehabilitation of industrial establishments goes forward slowly. The largest of Manila's cordage factories resumed operations on June 1 and continued production throughout July. Several pre-war agencies have been revived—the National Development Company, the National Coconut Corporation, the National Rice and Corn Corporation, and the National Power Corporation. The Philippine Congress gave attention to the development of the fishery industry. Licenses to resume business have been granted to seven insurance companies.

FINANCES

The whole system of taxation and revenue has been destroyed. Finances are gravely depleted and in a chaotic condition owing to the various currencies in use. The Japanese had put in circulation some 40,000,000 pesos in Philippine bank notes previously redeemed and against which there was no reserve and had printed billions of dollars of worthless paper money. After the fall of Manila the President of the Philippines had authorized branches of the Philippine National Bank to issue emergency bank notes; the United States Army had authorized the issuance of millions of pesos to guerrilla organizations in order to maintain fighting units, and had brought Victory pesos with which to pay United States troops and Filipino labor, etc. Unknown quantities of the old pre-war pesos are still in circulation. Coins amounting to $8,500,000, which were dumped in Manila Bay in the early days of the invasion to prevent their falling into enemy hands, have been salvaged from the mud of the wreck-filled bay.

The Philippine Congress has dealt particularly with economic and rehabilitation problems. Its legislation included an act to rehabilitate the Philippine National Bank. That bank was opened for business on July 23, taking over assets of the Banking Division of the Philippine treasury. It now has seven branches. Six other banks have since been reopened. The Congress amended laws governing the use of the Exchange Standard Fund so that about $25,000,000 could be released for general expenditures; it appropriated $10,000,000 to be loaned to the Manila Railroad Co., arranged to grant loans to sugar planters; and amended the Internal Revenue Code with a view to increasing taxes.

VIRGIN ISLANDS OF THE UNITED STATES

By Morris F. de Castro

Government Secretary of the Virgin Islands

DESCRIPTION

The Virgin Islands of the United States, formerly known as the Danish West Indies, were acquired by the United States by purchase from Denmark in 1917. This group comprises three islands: St. Croix, 82 square miles in area, with a population in 1940 of 12,902; St. Thomas, 32 square miles, with a population of 11,265; St. John, 19 square miles, with a population of 722; and approximately 50 smaller, uninhabited islands. St. Thomas lies 39 miles east of Puerto Rico, and 1,400 miles southeast of New York; St. Croix, 59 miles to the southeast of Puerto Rico, and 40 miles south of St. Thomas; and St. John, three miles east of St. Thomas.

The Virgin Islands of the United States constitute the latest addition to United States territorial possessions, acquired in 1917 from Denmark in consequence of the threat of compulsory sale to Germany, already foreshadowed by evidence of German penetration. The purchase price was $25,000,000. This sum is by far the largest ever paid by the United States for the acquisition of territory. It represents $295 per acre, as compared with $0.02 for Alaska, $0.03 for California, $0.04 for Louisiana, $0.14 for the Philippines, $35 for the Canal Zone. Since the transfer, it is estimated that the Federal Government has spent over $13,000,000 for the benefit of the Islands.

GOVERNMENT

The seat of government is at Charlotte Amalie, on the island of St. Thomas, whose harbor is one of the finest in the Caribbean. The Organic Act of 1936 prescribes that the Governor and the Government Secretary shall be appointed by the President, while the Administrator for St. Croix and other heads of departments are appointed by the Secretary of the Interior. The two municipalities of St. Thomas—St. John and St. Croix, corresponding to the three largest islands, each elects by universal suffrage a municipal council with power over municipal finances subject to review by the Governor. These councils also confirm the Governor's appointments of municipal officers. The Governor is Charles Harwood.

ECONOMIC SITUATION

The economic future of the island of St. Thomas, an excellent bunkering port, must of necessity continue to revolve around the activities of its harbor and its natural beauty and attraction for tourists and winter residents. Temporarily disrupted because of abnormal shipping conditions incident to the war, and substituted during the past two years by a tremendously improved economy resulting from the suddenly expanded liquor industry, the harbor of Charlotte Amalie began to show signs of a recurrence of its once healthy activity, as neutral ships again were permitted to call here for bunkers.

A tremendous advance for the islands was the recent merging of a Puerto-Rican airline, servicing the Virgin Islands and Puerto Rico, with one of the large national airlines bringing new, modern, and fast air equipment to the islands, as well as the recent extension of daily air service from the mainland to the island of St. Thomas by another American airline. The tourist possibilities thus opened are vast.

Here, as possibly in no other place under the American flag, Americans seeking relief from sweltering summers and zero weather, may find perpetual sunshine, equable climate, good beaches, excellent sport fishing, horseback riding on mountain trails with unsurpassed views, and may live in substantial comfort among a friendly, law-abiding, and intelligent people.

As for centuries past, the economic story of the island of St. Croix still has to do with the growing and processing of sugar cane, even though the cane acreage of the island is now less than one-third of what it was in the island's heyday. Literally a drop in the bucket of the world's sugar market, St. Croix this year produced 4,040 tons of raw sugar, while 3,200 tons of cane were processed for rum, but this—the major economic factor of the island of St. Croix—is perennially handicapped by weather, marginal low yield land, and sugar prices.

FINANCE

For the fourth successive fiscal year the Municipality of St. Thomas and St. John operated without a Federal deficit appropriation. On June 30, 1945, the treasury of the Municipality of St. Thomas and St. John showed a revenue surplus of $104,919.71. Conversely, the Municipality of St. Croix operated with a Federal deficit appropriation of $100,000. Of this amount, approximately $51,000 was unexpended as of June 30, 1945.

The actual revenues of the Municipality of St. Thomas and St. John amounted to $1,257,416.53. The comparable figure for the fiscal year ended June 30, 1944 was $1,617,705.36. The budget for the Municipality of St. Thomas and St. John carried total appropriations of $1,152,496.82. The revenues of the Municipality of St. Croix amounted to $515,383.28 compared with $262,684.89 in the preceding year. The budget for this municipality carried total appropriations of $589,558, of which local revenues were estimated at $489,558, and a Federal appropriation of $100,000. Of this Federal appropriation, approximately $51,000 was not expended. This unexpected situation was owing to an unprecedented increase in income taxes from the rum industry during the fiscal year 1945.

The wide variation in revenues of the Municipality of St. Croix for the years 1944 and 1945, was caused almost entirely by a corresponding rise and fall of income taxes from the rum industry. This unusual revenue, resulting as it did from increased distilleries' profits, could not be counted upon as a stable source of future revenue. Prices and profits dropped suddenly when the distillation of beverage spirits was permitted by continental producers.

The Virgin Islands Company which had lost $300,000 up to 1944, made a profit of over $700,000 in the last fiscal year and paid an income tax of $207,000 to the Municipal treasury of St. Croix in 1945.

PUBLIC WORKS AND EDUCATION

Owing to the continuation of the war emergency, the Public Works Department confined itself to the accomplishment of work which could be done with materials obtainable in the islands and in Puerto Rico. Education in the Municipality of St. Thomas and St. John enjoyed more adequate financial support. Vocational training was continued and facilities improved.

During the year, considerable attention was given to the major problem of electric light and power conversion as a post-war necessity. In St. Thomas the electric current used is 220 volt direct current and is supplied by a private company. In St. Croix, the towns of Christiansted and Frederiksted are equipped with 110 volt direct current systems furnished by a private company. Operating costs are high, resulting in abnormally high rates to consumers. The rural districts of St. Croix, however, are supplied with a low rate 110-volt alternating current service by the Rural Electrification Division of the Virgin Islands Company.

HEALTH AND SOCIAL SERVICES

During the year under review epidemics were gratifyingly scarce and the general health of the islands was good. Improved finances permitted the Department of Social Welfare to render more adequate assistance to the poor in the form of cash assistance, community grants, services of various kinds, and institutionalization of the aged. In both municipalities there was a gratifying improvement in the social services and especially in child welfare work. The most serious problems throughout the year was that of unemployment. This situation was aggravated by the cessation of military projects and the decline of private industries as a result of decreased rum shipments and general business decline.

LEGISLATION

The Legislative Assembly of the Virgin Islands this year enacted inadequate ordinances to govern the production, inspection, and sale of milk, and the sale of meat and meat products. A fairly satisfactory law regarding the practice of medicine and its allied sciences was adopted and a uniform law concerning actions to declare void or dissolve the marriage contract. Outstanding items of legislation in St. Thomas were an antidiscrimination law determining the right of all persons to enjoy the facilities offered by public places and businesses on the island of St. Thomas and a law to protect the public health by controlling the spread of endemic typhus fever. In St. Croix, the Municipal Council adopted ordinances creating a Homestead Commission, a Recreation Commission, a Municipal Police Commission, and a salary scale for teachers.

THE VIRGIN ISLANDS COMPANY

This is a government corporation incorporated by an ordinance enacted by the Municipal Council for the Municipality of St. Thomas and St. John in April 1934, to manage and operate certain lands, buildings, and factories, owned by the United States, under an operating agreement between the United States and the Company. The purpose of the Company is to rehabilitate industry within the Virgin Islands for the benefit of the people therein, thereby stabilizing employment and improving the standard of living.

During the fiscal year ended June 30, 1945, the Company cultivated approximately 2,800 acres of administration sugarcane. Because of severe drought conditions, which caused the privately-owned La Grange Sugar Factory to close in 1940, the Company now grinds the entire crop of sugarcane produced on the Island of St. Croix, and, therefore, is the only market for approximately 550 small growers of sugarcane. During the 1945 fiscal year, the Company ground 44,725 tons of sugarcane, of which 14,307 tons were purchased from Federal homesteaders and small growers, producing 4,040 tons of raw sugar.

During the current fiscal year the Company manufactured 196,120 proof gallons of rum and has an excess of 533,955 proof gallons aging in the Company's warehouses.

During eleven years of operation, The Virgin Islands Company has rehabilitated the sugar industry and kept it alive for economic reasons; developed a profitable rum industry to offset the losses of the necessary sugar industry; increased commerce; furnished employment to approximately 1,000 families; paid to the Municipality of St. Croix amounts equal to the taxes a regular commercial corporation would be assessed, thereby decreasing deficit appropriations from the Congress of the United States; and improved living conditions in St. Croix through regular employment and better housing facilities.

POST-WAR PROGRAM

The post-war program for the Virgin Islands has centered around the projected construction of public works, health, and sanitation facilities, for which Congress has authorized appropriations totaling $10,000,000. New hospital facilities, sanitation and fire protection, sewers and water systems, sewage treatment and disposal, water supply facilities, schools and educational buildings, waterfront improvements, highways, roads and streets, recreational facilities, telephone and radio communication, malarial control, and slaughterhouse and market facilities, are included in this five-year program authorized to be constructed by the Federal Works Agency. Actual construction was withheld because of the war necessity of conserving critical material but it is expected that an appropriation of the first $2,000,000 will be made in time to permit the beginning of construction early in 1946.

GUAM AND AMERICAN SAMOA

By Richard H. Hughes
Lieutenant, SC., USNR; Navy Department

GUAM

The recorded history of Guam goes back to Magellan's voyage around the world, in the course of which he touched at Guam. Because of its harbor, Guam became a stopping place for Spanish galleons carrying treasure from Acapolco to Manila and was a center for the Spanish empire in the Pacific. During the sixteenth century a college was established there, and natives of the island traveled to Manila and to Madrid. As the Spanish empire declined, Guam's fortunes also declined, and by the middle of the nineteenth century the Island was important primarily as a harbor to which the American and English whaling ships, bound for the Bering Sea, could repair for shelter from typhoons and to take on water and fresh vegetables.

When the Spanish-American war broke out an American squadron en route to Manila, sent a warship to capture Guam. The capture was effected without any resistance on the part of the Spanish garrison. By the Treaty of Paris, jurisdiction over Guam was given to the United States in 1898. By executive order of President McKinley, the Secretary of the Navy was directed to provide for the government of the Island, and a naval government was established which remained as the sole authority on Guam until the island was captured by the Japanese on Dec. 10, 1941. Guam remained under Japanese domination until July 1944, when it was recaptured by the United States. At the present time Guam is under military government incident to military operations for its recapture and pending re-establishment of the prewar form of Naval government.

AMERICAN SAMOA: HISTORY

In 1872 the harbor of Pago Pago, in Tutuila, was ceded to the United States for a naval and coaling station, and in 1878 rights of freedom of trade and extra-territorial jurisdiction in Samoa were granted. On June 14, 1889, a treaty, to which the United States, Germany, and Great Britain were parties, proclaimed the Samoan Islands neutral territory, with an independent government, the natives being allowed to retain their own laws and customs. A Supreme Court of Justice, presided over by an American citizen, was established for the settlement of civil and criminal cases involving foreigners.

The kingship was abolished in 1899, because of internal disturbances, and by the Tripartite Treaty of Nov. 14 of that year, Great Britain and Germany renounced, in favor of the United States, all rights over the islands of the Samoan group east of 171 degrees west longitude, the islands to the west of that meridian being assigned to Germany. After the First World War a mandate over the former German islands was established, administered by New Zealand.

GOVERNMENT

A United States Naval Station is located at Pago Pago, which offers the only good harbor in Samoa and is said to be the best in the South Seas. The commandant of this naval station is also the governor of American Samoa, holding his commission from the President of the United States. He appoints officers and frames laws or ordinances, but native customs not inconsistent with the laws of the United States are not changed without the consent of the people.

The Islands are organized in three political divisions corresponding to the old Samoan political units. In each such district there is a native governor, county chiefs and village chiefs. All of these officials are appointed by governmental authority although each district governor has indirect control of the county chiefs, and the county chiefs of the village chiefs.

The judicial power is vested in a High Court, six District Courts and 44 Magistrate Courts. All judicial matters are handled exclusively by Samoans, with the exception of the High Court, which is presided over by the Chief Justice of Samoa, who is either an American civilian or naval officer. The other members of the High Court consist of either two or four Samoans, depending on the gravity and importance of the case. There is a Samoan Guard of 142 men, under the jurisdiction of the U. S. Navy.

The costs of government are met by taxes, imports, and the earnings of government-owned corporations such as the transportation service and the bank. There is a 1 per cent tax on freehold property, a tax on lessors in the amount of 5 per cent of the rent received, and a poll tax. License fees on stores and import duties are also important sources of revenue to the government.

GEOGRAPHY

The total area of American Samoa is 76 square miles, and it has a population (July 1, 1945) of 16,493 Samoans. The Island of Tutuila, 70 miles from Apia, has an area of 40.2 square miles, and a population of 13,948 (including the Island of Aunu'u). Swain's Island, annexed in 1925, is from a mile and one-half to two miles in diameter and has a population of 130.

AGRICULTURE AND TRADE

There are no public lands in Samoa. Nearly all of the land is owned by the Samoans and, with a few exceptions, can not be sold to anyone but another Samoan.

The soil is fertile, and abundant crops of taro, breadfruit, yams, coconuts, pineapples, oranges, and bananas are raised. Copra of excellent quality is produced for export. In 1942 the Island exported 107 tons of copra, valued at $7,212. Other exports are reed mats and curios. During the fiscal year ended June 30, 1941 imports totaled $263,703 and exports totaled $93,839.

EDUCATION

In 1945 the Samoan Government was maintaining 42 public schools, with 94 Samoan and four white teachers, and a total of 3,300 enrolled pupils. There are also four secular schools, with an additional enrollment of about 500 pupils. Education is compulsory between the ages of seven and 15, and it is expected that a complete high school education will be offered in the near future. The census of 1940 showed that illiterates of 10 years of age or older numbered 540, or 6.3 per cent of that age group.

HEALTH

There are no privately practicing physicians or dentists. Operating in conjunction with the local hospital is a mobile child health clinic, which offers medical treatment to all of the children on the Island of Tutuila.

TRANSPORTATION, COMMUNICATIONS, AND BANKING

About 45 miles of roads have been constructed on the Island of Tutuila. There are no roads on any of the other islands of American Samoa. There is a United States Naval radio station on Tutuila, open to commercial traffic which reaches New Zealand, Australia, Honolulu, the United States, and other islands in the Pacific. The Bank of American Samoa is the only bank and conducts all types of commercial banking business. The fast mail steamers of the Matson Navigation Company touch here on their regular trips from the United States to Hawaii, Fiji, New Zealand and Australia.

THE DISTRICT OF COLUMBIA

By W. Reed West
Professor, The George Washington University

DISTRICT SUFFRAGE

There was much public discussion in 1945 of proposals to grant some form of suffrage to the people of the District of Columbia. Certain of these proposals have centered around the granting of some form of representation in Congress and the electoral college. Others have been designed to relieve Congress of its burden of enacting detailed legislation for the District by providing for a government of locally elected officers. However, none of these proposals has got beyond the stage of public agitation or the introduction of bills in Congress.

THE VIRGINIA BOUNDARY

In a Supreme Court decision in 1931 (Washington Airport *v.* Smoot Sand and Gravel Corporation, 283 U.S. 348), it was held that the District boundary with Virginia followed the high-water mark of the Potomac on the Virginia shore as it existed at the time the District was created in 1791. That line was never exactly determined and marked, and, moreover, there have been considerable alterations in recent years through the construction of the Washington National Airport, the Mount Vernon Memorial Highway, and the Pentagon Building and its approaches. There was uncertainty in respect to which authority, Virginia or the District, had police jurisdiction in the area below the old high-water line. By Act of Congress (Public 208), subject to approval by Virginia, the boundary is now established at high-water mark on the Virginia side as it now exists and along the pierhead line in Alexandria. If alterations of the line occur through natural causes or through Federal construction or through a change in the Alexandria pierhead line, the boundary is to follow the line as so changed. The United States retains concurrent jurisdiction over the territory included between the old line of 1791 and the new line. Virginia is to consent to exclusive Federal jurisdiction over the Washington National Airport, subject to some provisions retaining certain powers of taxation, court process, and beverage control. The Federal Government reserves the right to apply certain aspects of its criminal code to the airport and the George Washington Memorial Parkway.

While there may be imperfections

in these arrangements it was felt that the main problem was to eliminate the no-man's land from the point of view of criminal jurisdiction that had existed in the disputed area. This appears to have been accomplished. It is not anticipated that there will be objections on the part of Virginia to the proposed arrangement since the Virginia legislature approved its main provisions in 1942.

DISTRICT INSTITUTIONS

New salary scales for the police and fire departments were provided in Public 122 and 151. Increases for teachers and school officials were provided in Public 158 and 160-A. The new scale for elementary school teachers ranges from $1,900 to $3,300, for junior high school teachers from $1,900 to $3,700, and for senior high school teachers from $2,100 to $3,700. The appointment of temporary teachers at basic salary rates was authorized (Public 44). The salary of the executive secretary of the Nurses' Examining Board was increased in Public 117.

In order to bring the law to present accepted practice the act in respect to feeble-minded persons admitted to the District Training School at Laurel, Maryland, has been amended so as to require that when such persons have an estate the cost of maintenance may be deducted from the estate, and where there is no estate that the District may require reimbursement from the father, mother, husband, wife, and adult children of the person admitted (Public 46). Another act provides that, in the case of defendants before the police or juvenile courts, where there is prima-facie evidence of an unsound mind, the court may send the defendant to the Gallinger Municipal Hospital for examination (Public 110). Another act removes restrictions upon the appointment of retired officers of the United States Public Health Service or retired civilian employees of the United States Government or of the District government as Superintendent of Gallinger Municipal Hospital (Public 131).

CORPORATIONS

Under pre-existing law, religious and missionary societies were permitted to include in their bylaws a provision that less than a majority might constitute a quorum for the transaction of business. There seemed to be no good reason why other benevolent, charitable, educational, literary, musical, and scientific societies should not have this privilege, especially since there are in Washington such societies with a nationwide membership that makes a quorum of a majority difficult to obtain. The privilege was granted to such societies in Public 233. Another act (Public 235) relieved trust companies of the obligation of filing certain reports.

EMERGENCY LEGISLATION

As a war measure, the Minimum Wage Board was authorized to issue permits to employ women more than eight hours a day with pay at a time-and-a-half for overtime. This act, which was to expire June 30, 1945, was extended for one year. The language of the original act, authorized such permits when "essential to the war effort" remains unchanged (Public 41).

The final date for the clearance of alleys under the Alley Dwelling Act of 1934 was extended for another year (Public 129), and the Emergency Rent Act was extended to Dec. 31, 1946 (Public 242).

Under the District Code, certain charitable, religious, and educational institutions, and the like, were exempted from taxation while their property was "occupied and used" by the institution named. During the war, some of these institutions offered some of their property for use in the war effort for a compensation covering maintenance and depreciation. Since such property was not then "occupied and used" by the institutions themselves, the Commissioners had ruled that they were no longer exempt from taxation upon such property. As a measure of equity, an act (Public 237) exempts these institutions from taxation where the property is used by the United States Government or the

American Red Cross, where the compensation does not result in the "receipt of rent or income" within the meaning of the law.

The War and Navy Departments have advised men released from service that they should record their certificates of service or discharge with the clerk of the court or other record office in their home counties. However, the United States District Court for the District of Columbia appeared to have no authority to make such records, and even if made they would probably have had no legal efficacy. As a result, Congress authorized the Recorder of Deeds of the District to make such records without charge to the veteran (Public 45). Another act (Public 241) provided for free copies of public records of marriages and the like for use in presenting claims to the Veterans Administration.

MISCELLANEOUS LEGISLATION

An epidemic of rabies in Washington and its vicinity led to legislation (Public 128) authorizing the Commissioners in the presence of rabies in the District to issue proclamations not only requiring muzzling, leashing, or quarantine, but also vaccination against rabies. The dog tax was increased from $2 to $3 to help defray the cost of vaccinations where the owners did not employ their own veterinarians for the purpose. In the House committee report on this legislation, the dog population of the District was estimated at more than 50,000. During the calendar year 1944 there had been three deaths from hydrophobia. From Nov. 3, 1944 to Feb. 3, 1945, 36 rabid dogs were reported and 27 persons were bitten by rabid animals. The old law had restricted the Commissioners to proclamations requiring muzzling.

In Public 43 the powers of the Superintendent of Weights, Measures, and Markets were greatly strengthened, and in Public 25 the weight of commodities sold by the ton was reduced from the long ton of 2,240 pounds to the short ton of 2,000 pounds, to correspond with the practice at the coal mines. Congressional tags for cars, authorized in 1931, were limited to the Congress in which such tags were issued (Public 115), the sale of small rockfish (striped bass) was prohibited (Public 234), and some other legislation of a minor character was passed.

DIVISION VII

PUBLIC FINANCE AND TAXATION

NATIONAL FINANCE AND THE PUBLIC DEBT

By William J. Carson
Associate Professor, University of Pennsylvania

SUMMARY—TRANSITION FROM WAR TO PEACE

National finance in 1945 reflected the requirements of the country in the closing days of its maximum war effort; its needs during the period of transition from war to peace; its problems of the war's aftermath at home and abroad; and finally the tasks which began to emerge by reason of the position in which the United States found itself as a major world power at the war's end. In addition, the composition and magnitude of the Federal budget in the post-war years became clearer.

Following victory over Germany in the spring of 1945 the war program was curtailed, and after victory over Japan in August further retrenchments in outlays were made. For fiscal 1946 as a whole, July 1, 1945-June 30, 1946, Federal expenditures were estimated by President Truman in his budget message to Congress in January 1946 to have declined $67,394,000,000 as compared with a total of $100,405,000,000 in fiscal 1945, the last full year of the global war.

Net receipts from taxation in fiscal 1946 are estimated to be $38,609,000,000, about 57 per cent of total expenditures. In fiscal 1945, net receipts totaled $46,457,000,000, about 46 per cent of expenditures. At the end of June 1945 the Federal debt totaled $258,682,000,000; at the end of January 1946, it was stated to be $279,444,616,125. In fiscal 1945 the public debt increased $57,679,000,000; in fiscal 1946 expenditures will exceed receipts by $28,785,000,000, but because of a reduction in the Treasury cash balance of $12,785,000,000 the debt is expected to increase only $16,318,000,000.

Table I summarizes the receipts and expenditures and the deficit in fiscal 1945, and the estimated receipts and expenditures and deficit in fiscal 1946.

FEDERAL EXPENDITURES

Total expenditures (general and special accounts) of $67,400,000,000 estimated for fiscal 1946 are approximately $33,000,000,000 smaller than in fiscal 1945, when the maximum outlay for any year of the war was reached. The principal purposes for which the expenditures of $67,400,000,000 in fiscal 1946 will be required were reported by the President in his budget message as follows:

(in millions)

	Fiscal 1946
Defense, war, and war liquidation...	$49,000
Aftermath of war: Veterans, interest, refunds....................	10,813
International finance (incl. proposed legislation)......................	2,614
Other activities....................	4,967
Total......................	$67,394

VII. PUBLIC FINANCE AND TAXATION

TABLE I

GENERAL BUDGET SUMMARY—COMPARATIVE STATEMENT OF RECEIPTS AND EXPENDITURES

General and Special Accounts

Description	Estimated, Fiscal 1946	Actual, Fiscal 1945
Receipts		
Direct taxes on individuals	$15,844,800,000	$19,788,893,624.36
Direct taxes on corporations	12,393,600,000	16,399,031,961.50[2]
Excise taxes	6,302,490,000	5,934,575,068.46
Employment taxes	1,581,300,000	1,792,700,136.62
Customs	413,200,000	354,775,541.50
Miscellaneous receipts	3,171,167,952	3,469,548,007.12
Total receipts	$39,706,557,952	$47,739,524,339.56
Deduct net appropriation to Federal old-age and survivors insurance trust fund	1,097,730,000	1,282,969,759.85
Net receipts (based on existing and proposed legislation)	$38,608,827,952	$46,456,554,579.71
Expenditures:		
National defense (tentative estimate for 1947) (see also Government corporations below)	$48,800,000,000[3]	$90,029,145,512.84
Interest on the public debt	4,750,000,000	3,616,686,048.31
Refunds	2,715,618,000[4]	1,714,880,287.89[4]
Veterans' pensions and benefits	3,346,815,000	2,043,872,734.13
International finance (based on existing and proposed legislation) (see also Government corporations below)	2,512,500,000	—
Aids to agriculture	466,238,938	602,351,648.75
Social security, relief and retirement:		
Social security program	538,480,000	476,365,111.49
Work relief	12,330,500	4,640,335.27
Retirement funds	606,567,600	505,579,500.00
General public works program:		
Highways and airports	145,486,000	41,698,418.03
Rivers and harbor	79,620,000	55,789,374.47
Flood control and reclamation (including power)	308,388,800	161,518,328.69
Veterans	55,000,000	15,799,142.62
Housing	100,000,000	—
Other general public works	52,545,900	15,779,308.45
General government:		
Legislative branch	35,873,000	28,893,273.21
The Judiciary	14,485,600	13,006,336.70
Executive Office of the President	3,187,000	2,449,629.06
Civil departments and agencies	1,244,542,797	1,069,652,796.84
Postoffice Department (general fund)	—	486,898.79
District of Columbia (Federal contribution)	6,000,000	6,000,000.00
Expenditures from anticipated supplemental appropriations	1,350,000,000	—
Expenditures based on proposed legislation (excluding international finance)	250,000,000	—
Statutory public debt retirement	—	2,000.00
Total expenditures (based on existing and proposed legislation)	$67,393,679,135	$100,404,596,685.54
Excess of expenditures	$28,784,851,183	$53,948,042,105.83

Checking Accounts of Government Corporations and Credit Agencies with the Treasurer of the United States

Net expenditures from checking accounts (based on existing legislation):		
National defense	$200,000,000	$472,033,180.28
International finance	101,000,000	164,811.36[1]
Redemption of obligations in the market	230,000,000	1,552,733,547.88
Other activities	466,000,000[1]	846,218,782.69[1]
Net expenditures (based on existing legislation)	$65,000,000	$1,178,383,134.11

TABLE I (Continued)

Trust Accounts

Description	Estimated, Fiscal 1946	Actual, Fiscal 1945
Receipts (based on existing legislation):		
Unemployment trust fund:		
Deposits by states	$1,055,500,000	$1,256,002,876.17
Deposits by Railroad Retirement Board and other receipts	251,371,803	242,805,514.93
Transfers from general and special accounts	9,617,970	8,948,213.00
Federal old-age and survivors insurance trust fund:		
Net appropriation from general account receipts	1,097,730,000	1,282,969,759.85
Interest on investments	147,276,473	123,853,998.15
Veterans' life insurance funds:		
Premiums and other receipts	1,110,172,000	1,108,093,913.11
Transfers from general and special accounts	1,228,000,000	1,116,524,685.43
Federal employes' retirement funds:		
Deductions from employes' salaries and other receipts	330,795,062	360,474,278.59
Transfers from general and special accounts	247,316,800	196,762,500.00
Railroad retirement account:		
Interest on investments	19,874,000	15,240,493.19
Transfers from general and special accounts	359,250,800	308,817,000.00
Other trust accounts:		
Transfers from general and special accounts	6,000,000	3,105,953.25
Miscellaneous trust receipts	821,737,152	1,041,223,631.22
Total receipts (based on existing legislation)	$6,684,642,060	$7,058,610,910.39
Expenditures (based on existing legislation):		
Unemployment trust fund:		
Investments in United States securities	$ 311,489,773	$ 1,437,173,400.00
Withdrawals by states and other expenditures	1,005,000,000	71,277,332.93
Federal old-age and survivors insurance trust fund:		
Investments in United States securities	951,697,753	1,137,410,920.00
Benefit payments	323,000,000	239,833,904.85
Veterans' life insurance funds:		
Investments in United States securities	2,043,832,000	2,046,526,289.50
Insurance losses and refunds	294,340,000	152,671,355.91
Federal employes' retirement funds:		
Investments in United States securities	394,726,700	399,448,000.00
Annuities and refunds	186,151,399	150,628,135.30
Railroad retirement account:		
Investments in United States securities	218,000,000	182,000,000.00
Benefit payments	161,000,000	141,444,643.89
Other trust accounts:		
Investments in United States securities	13,799,000	2,390,000.00[1]
Miscellaneous trust expenditures	733,604,953	427,765,346.12
Special deposit accounts (net)	300,000,000	1,301,979,198.70[1]
Total investments in United States securities	$3,933,545,226	$5,200,168,609.50
Total benefit payments, annuities and other expenditures	3,003,096,352	118,358,479.70[1]
Total expenditures (based on existing legislation)	$6,936,641,578	$5,081,810,129.80
Excess of expenditures over receipts	$251,999,518	—
Excess of receipts over expenditures	—	$1,976,800,780.59

---

[1] Excess of credits, deduct.

[2] Includes refundable excess-profits taxes estimated at $761,100,000.

[3] Includes estimated expenditures from anticipated supplemental appropriations.

[4] Includes transfers to public debt accounts for excess-profits tax refund bonds issued.

Included in the figure of $49,000,000,000 for defense, war, and war liquidation are outlays by the War and Navy Departments and other agencies such as the United States Maritime Commission, War Shipping Administration, Office of Price Administration; payments to the United

Nations Relief and Rehabilitation Administration; mustering-out pay to men in the armed forces on demobilization; contract settlement and surplus property disposal; and authorizations for war and national defense.

The aftermath of war expenditures include outlays for veterans' pensions and benefits which have become one of the largest single categories in the budget; interest payments on the public debt; refunds to individuals and corporations for excess tax payments; loss and excess profits credit; carry-backs; recomputed amortization on war plants; and special relief from excess profits taxes.

Outlays for international financial programs include the credits extended and contemplated to allied countries following termination of lend-lease; loans by the Import-Export Bank to facilitate the foreign trade of the United States; credits such as those that will become operative when the loan of $3,750,000,000 to Great Britain is made; and the funds that are called for under the Bretton Woods Agreements.

Included in the expenditure of $5,000.000,000 for other activities are the outlays for agricultural programs, including conservation and use of land, rural electrification, Farm Security Administration, Farm Credit Administration; for resource development; for social security, relief, and retirement; public works; aids, subsidies, and regulatory controls for transportation; and expenses of general government.

REVENUE AND TAXATION

Net receipts (general and special accounts) during fiscal 1945 totaled $46,457,000,000, the maximum figure reached during the war. In fiscal 1946, receipts are estimated to decline to $38.609,000,000. The figure for fiscal 1947 is estimated to decline still further to $31,513,000,000. Direct taxes on individuals are estimated at $15,845,000,000 in fiscal 1946, direct taxes on corporations at $12,394,000,000, and excise taxes at $6,302,000,000. Lower taxes in fiscal 1946 are in large degree the result of the Revenue Act of 1945 which was a major tax reduction measure, the total tax load being decreased by more than one-sixth. The details of receipts and revenues are given in Table I.

GROWTH AND DISTRIBUTION OF THE PUBLIC DEBT

At the close of the fiscal year ended June 30, 1945, the Federal public debt was $258,682,000,000. By June 30, 1946, the end of fiscal 1946, it is estimated to total $275,000,000,000. Table II shows the effect of financing operations on the public debt in fiscal 1945 and estimates of the effect of operations in fiscal 1946.

TABLE II

FISCAL OPERATIONS AND CHANGES IN THE PUBLIC DEBT

Description	Estimated, Fiscal 1946	Actual, Fiscal 1945
Public debt at beginning of year	$258,682,187,410	$201,003,387,221.13
Increase in public debt during year:		
General and special accounts, excess of expenditures over receipts	$28,784,851,183	$53,948,042,105.83
Checking accounts of Government corporations and credit agencies, net expenditures	65,000,000	1,178,383,134.11
Trust accounts, excess of expenditures over receipts	251,999,518	−1,976,800,780.59
Statutory public debt retirement	—	−2,000.00
Adjustment for change in Treasury cash balance	−12,784,038,111	+4,529,177,729.45
Increase in public debt during year	$ 16,317,812,590	$ 57,678,800,188.80
Public debt at end of year	$275,000,000,000	$258,682,187,409.93

Analysis of the composition of the Federal debt by amount and kind of issues outstanding June 30, 1944 and June 30, 1945 is given in Table III.

Distribution of the Federal debt among different investors on June 30, 1944 and June 30, 1945 is shown in Table IV.

Examination of the figures in Table IV shows that the increase in the pub-

TABLE III

UNITED STATES GOVERNMENT DEBT—AMOUNT AND KIND OF ISSUES

Issues	Outstanding Public Debt	
	June 30, 1945	June 30, 1944
Interest-bearing debt:		
Public Issues:		
Pre-war bonds (World War I), including postal savings bonds	$ 195,824,740.00	$ 195,926,860.00
Treasury bonds	106,448,403,950.00	79,244,104,350.00
United States savings bonds	45,585,588,646.30	34,606,141,184.59
Depositary bonds	504,534,000.00	474,321,750.00
Adjusted service bonds	—	217,283,050.00
Treasury notes	23,497,339,700.00	17,404,896,800.00
Treasury notes (tax series)	68,237,825.00	109,021,750.00
Treasury notes (savings series)	10,067,516,000.00	9,447,737,600.00
Certificates of indebtedness	34,135,861,000.00	28,822,416,000.00
Treasury bills	17,041,258,000.00	14,734,104,000.00
Total, public issues	$237,544,563,861.30	$185,255,953,344.59
Special issues:		
Government life insurance fund (adjusted service bonds)	$ 500,157,956.40	$ 500,157,956.40
Federal old-age and survivors insurance trust fund (notes)	3,659,600,000.00	4,385,500,000.00
Railroad retirement account (notes)	500,500,000.00	318,500,000.00
Civil service retirement fund (notes)	1,848,270,000.00	1,450,913,000.00
Foreign Service retirement fund (notes)	7,836,000.00	7,012,000.00
Canal Zone retirement fund (notes)	10,298,000.00	9,187,000.00
Alaska Railroad retirement fund (notes)	1,911,000.00	1,755,000.00
Postal Savings System (notes)	461,000,000.00	264,000,000.00
Canal Zone Postal Savings System (notes)	3,500,000.00	3,500,000.00
Government life insurance fund (notes)	2,400,000.00	1,900,000.00
National service life insurance fund (notes)	3,187,125,000.00	1,213,425,000.00

Total special issues	$18,812,051,956.40	$14,287,401,956.40
Total, interest-bearing debt	$256,356,615,817.70	$199,543,355,300.99
Non-interest-bearing debt:		
Public issues:		
Matured debt on which interest has ceased (payable on presentation)	$ 268,667,135.26	$ 200,851,160.26
Debt bearing no interest (payable on presentation)	2,056,904,456.97	1,250,180,759.88
Total, non-interest-bearing debt	$2,325,571,592.23	$1,460,031,920.14
Total, public debt on basis of daily Treasury statement	$258,682,187,409.93	$201,003,387,221.13

TABLE IV

DISTRIBUTION OF UNITED STATES GOVERNMENT SECURITIES DIRECT AND FULLY GUARANTEED JUNE 30, 1944 AND JUNE 30, 1945

(In millions of dollars)

	June 30, 1944	June 30, 1945	Change	Percentage Distribution June 30, 1945
Total interest bearing securities	201,059	256,766	+55,707	100.00
Held by United States Government agencies and trust funds				
Special issues	14,287	18,812	+4,525	7.33
Public issues	4,810	6,128	+1,318	2.38
Held by Federal Reserve banks	14,901	21,792	+6,891	8.52
Privately held				
Total	167,061	210,034	+42,973	81.77
Commercial banks	68,431	84,069	+15,638	32.80
Mutual Savings banks	7,306	9,588	+2,282	3.63
Insurance companies	17,300	22,700	+5,400	8.84
Other investors				
Marketable issues	30,700	39,500	+8,800	15.40
Non-marketable issues	43,300	54,200	+10,900	21.10

lic debt between June 1944 and June 1945 was distributed among all types of investors. The increases in the holdings of the Federal reserve banks, however, were relatively larger than the increases in the holdings of other principal investors.

Analysis of the distribution of the Federal debt among different investors shows that the commercial banking system—the commercial banks and the Federal reserve banks together—hold over 40 per cent of the total; that 36 per cent is held by individuals, companies, and other non-institutional investors; and that insurance companies hold approximately 9 per cent.

WAR LOAN DRIVES

The two final war loan drives were held in calendar 1945—the Seventh War Loan in the spring, April 9-June 30, and the Victory Loan in the autumn, ended Dec. 31, 1945. Total sales of $26,300,000,000 were made during the Seventh Loan, and subscriptions of over $20,000,000,000 were reported during the Victory Loan. The Victory Loan marked the end of war borrowing and the beginning of the transition to post-war debt management.

USE OF BANK CREDIT IN WAR FINANCE

In an analysis of war financing and of the extent to which bank credit has been used, the National City Bank Letter January 1946 comments as follows:

"Although the primary purpose of government financing has been to raise the funds required, another important consideration has been to absorb as much as possible of the excess of inflationary money, created by government expenditures and not offset by production of civilian goods and services.

"During the Victory Loan, commercial bank absorption of government securities was apparently in the neighborhood of $6.3 billion, which was less than in most previous drives. Loans against securities, totaling around $3.1 billion, on the other hand, were apparently larger. The aggregate of commercial bank credit, including government securities purchased by the Federal Reserve Banks, was apparently almost as much in the larger drives, and represented a larger proportion of the net increase in government debt during the drive period.

"Whereas in the Victory Loan the percentage of credit involved was apparently larger than in earlier drives, the figures for the entire year 1945 indicate a somewhat lower percentage of government borrowing financed by the commercial banking system than in earlier years. This is shown by the following table (Table V).

"In the entire four years 1942 through 1945, approximately 45 per cent of the funds borrowed by the Government was provided by banks. At the end of 1945 commercial bank holdings of the national debt are estimated at $88 billion, or 32 per cent of the $279 billion total, while Federal Reserve Bank holdings were $24 billion, or 9 per cent."

MANAGEMENT OF THE PUBLIC DEBT

Noting the magnitude of the national debt of $275,000,000,000 and that $100,000,000,000 is held by the commercial banks and the Federal Reserve Banks, President Truman in his budget message to Congress discussed the tasks of debt management as follows:

"Heavy purchases by the banks were necessary to provide adequate funds to finance war expenditures. A considerable portion of these obligations are short-term in character and hence will require refinancing in the coming months and years.

"Since they have been purchased out of newly created bank funds, continuance of the present low rates of interest is entirely appropriate. To do otherwise would merely increase bank profits at the expense of the taxpayer.

"The 275-billion dollar debt poses a problem that requires careful consideration in the determination of financial and economic policies. We have learned that the problem, serious as it is, can be managed. Its management will require determined action to keep our Federal budget in order and to relate our fiscal policies to the requirements of an expanding economy.

"The more successful we are in achieving full production and full employment the easier it will be to manage the debt and pay for the debt service. Large though the debt is, it is within our economic capacity. The interest charges on it amount to but a small proportion of our national income."

GOVERNMENT BOND PRICES AND YIELD

After remaining fairly stable in 1943 and 1944, rates on medium- and long-term obligations of the Federal Government declined sharply in 1945. Rates, however, at which short term bills were issued continued at the same level as in 1944, and those for 9-to-12 month certificates of indebtedness were slightly higher than in

Tables VI, VII and VIII show in detail the course of the yields and prices by months in 1944 and 1945.

"INFLATIONARY" EXPANSION PROBLEM

At the beginning of 1945 President Roosevelt emphasized the importance of making plans to transform our all-out war economy into a full employment peacetime economy and urged fiscal programs to stimulate full employment in the post-war period. Attention, accordingly, was devoted by many to this problem and to steps to encourage reconversion and peacetime business expansion.

One of the fiscal actions taken in response to this interest following the victory over Japan was the Revenue Act of 1945. This was a major tax reduction measure that decreased the total tax load by more than one-sixth. Other actions included the removal of the wartime economic controls as circumstances permitted.

By the end of the year, however, sole emphasis was not on fiscal measures to stimulate business expansion; instead, increasing attention was being focused on the problem of preventing or controlling an "inflationary" boom. The fiscal steps proposed to exercise a check on an "inflationary" expansion were continuance of taxes as provided in the Revenue Act of 1945 with no further reductions in 1946; reductions of Federal expenditures still more than provided in the budgets for fiscal 1946 and 1947; management of the public debt in such a way that additional money through bank credit expansion would not be created; and finally to bring about a balance in the Federal budget.

In his budget message in January 1946, President Truman called attention to the inflationary pressures, recommended against further tax reduction, and urged that a move be made toward debt retirement and a balanced budget. He said ". . . inflationary pressures still appear dangerously powerful, and ill advised tax reduction would operate to strengthen them still further. . . .

"It is good to move toward a balanced budget and a start on the retirement of the debt at a time when demand for goods is strong and the business outlook is good. These conditions prevail today. Business is good, and there are still powerful forces working in the direction of inflation. This is not the time for tax reduction."

Discussing the same problem and urging a balanced budget as a major step against inflation, Chairman Marriner S. Eccles of the Federal Reserve Board, in a statement on Jan. 17, 1946 announcing the Board's decision to increase margin requirements to 100 per cent, said: ". . . the primary source of the inflation danger which overhangs the domestic economy on all fronts is the vast accumulation of currency and bank deposits at the disposal of the public as a result of the fact that far too much of the cost of the war was financed through the creation of commercial bank credit and not enough was financed out of taxes and the savings of the public . . .

"In addition, it is important to point out that so long as the public debt continues to be monetized through the purchase of Government securities by the banking system, the supply of money will continue to increase, thus tending further to reduce the interest rate on savings and investment funds. . . .

"It is, therefore, imperative that the process of further monetizing of the public debt through the banking system be ended . . . The process needs to be stopped not only by bringing about a balanced budget, but also through measures to check further unnecessary expansion of commercial bank holdings of Government securities."

VII. PUBLIC FINANCE AND TAXATION

STATE FINANCES AND TAXATION

By George H. Watson
Tax Consultant, Council of State Governments

REVENUES

State tax revenues for the fiscal year ended June 30, 1945 set a new record, according to a preliminary report of the Bureau of the Census, reaching a total of $5,500,000,000 (Table I). This increase of 1.9 per cent over the $5,400,000,000 collections of 1944, was the smallest percentage increase in any war year, and indicates a possible turning point in revenue totals. This possibility is discounted, however, when totals are studied more carefully. Unemployment compensation taxes actually declined for the first time since their imposition in the middle 1930's, but tax collections exclusive of this special source increased from $4,100,000,000 to $4,300,000,000, or 4.1 per cent, compared to a 3.7 per cent increase from these sources in 1944. Further grounds for believing that total state taxes may yet go higher lie in the substantial increases in gasoline, motor vehicle, tobacco, and alcoholic beverage revenues which may be expected to follow the end of wartime shortages of these commodities, in fact, have already begun.

The character of changes in revenues from individual taxes presents a different pattern from the previous war years. The outstanding difference lies in collections of corporation income taxes, which increased only 3.1 per cent in 1945, compared to 31.2

[1] Includes taxes from the following sources: insurance gross premiums, public utility gross receipts, pari-mutuels, admission and amusement sales, soft-drink sales; licenses for corporations in general, alcoholic beverages, hunting and fishing, occupations, chain stores, amusements, and race tracks; poll, documentary and stock transfers, and miscellaneous taxes.

* From *State Finances: 1945*, Bureau of the Census, Vol. II, No. 1, Preliminary.

per cent in 1944. The first place in increases among major taxes is taken by alcoholic beverages, with a gain of 15.4 per cent in 1945, after a decline of 4.6 per cent in 1944 caused by preemption of distilling facilities for industrial alcohol, and exhaustion of liquor stocks. No other important tax shows an increase of more than 10 per cent, except individual income taxes, which rose 10.8 per cent, substantially more than the 7.8 per cent increase of 1944. Death and gift levies, and severance taxes rose 15.8 and 16.9 per cent, respectively, but neither provides substantial revenues on a nationwide scale. Most major taxes showed increases of 1 to 8 per cent, while tobacco tax and motor vehicle license yields actually declined. Property taxes continued their long-range downward trend with a drop of 7.3 per cent, primarily reflecting the continued abandonment of this source of revenue to local governments.

The largest increase for any individual state occurred in New York, where the gain of 13.5 per cent resulted principally from the heavy yield of the corporation income tax, individual income taxes, and unemployment compensation taxes. Other states showing increases of more than 5 per cent, according to available data, were Mississippi, New Mexico, Kentucky, South Dakota, Wyoming, Missouri, and Louisiana. About one-third of the states had declining revenues in 1945, the same number as the preceding year, with the largest decreases in Pennsylvania, Arizona, and Nevada. Highest per capita collections were found in Washington ($81), California ($72), and New York ($67); while four states—Georgia, Kentucky, Nebraska, and Tennessee—tied for lowest with $27 per capita. The national average was $44.

Monthly collection data for excises show substantial increases for all except wine taxes during the calendar year 1945. Especially significant are

* From *State Finances: 1944*, Vol. III, Bureau of the Census.

exceptional increases in gasoline tax collections, starting in September when the effect of the war's end in August became apparent, and the change from declines to sharp increases in cigarette tax collections, starting in July with the release of more cigarettes and the imposition of new taxes in the new fiscal year. There is every reason to expect a continuation of these increases for some time, although general sales tax collections will probably prove more immediately sensitive to decreased incomes than the excises on specific commodities.

The trend of collections over a nine year period is shown in Table II. A steady increase is evident in general sales taxes, individual and corporation income taxes, and unemployment compensation taxes, as national income has risen through these years, but the drop in unemployment compensation taxes, with the falling off of industrial payrolls, probably foretells declines in the other taxes directly linked to income. Special excise and motor vehicle license taxes, on the other hand, have been held down by wartime shortages, but already show the trend which will yield sharp increases in the immediate post-war years. During the nine-year period, state tax collections as a whole rose 64 per cent, while national income during the same period more than doubled.

EXPENDITURES

Total state expenditures in 1944 changed less than one per cent from 1943, increasing from $5,920,000,000 to $5,959,000,000. This over-all stability conceals several significant changes, which may be seen in Table III. The most important single change was the increase of 13.4 per cent in contributions to trust funds, nearly all (more than 90 per cent) of which are payments into unemployment compensation funds of earmarked revenues from unemployment compensation taxes. This change represented an absolute increase of $167,000,000.

While provision for debt retirement slumped $157,000,000, or 41 per cent, from $382,000,000 to $225,000,000, the cost of operation of state governments rose almost the same amount, $147,000,000. This increase represented only 7 per cent, however, raising the $1,967,000,000 expenditures of 1943 to $2,104,000,000 in 1944. Expenditures for various functions increased for the most part by amounts of less than 10 per cent, clustering around the 7 per cent average increase. The most significant single increase among operating functions was the $49,000,000 increase in expenditures for schools; although only 16 per cent, this was much more important than the 23 per cent increase in expenditures for health and 50 per cent for libraries, because of the much smaller absolute amounts.

Capital outlay continued to fall off sharply, building up the backlog of deferred maintenance and new construction resulting from wartime restrictions on building. The decline was $153,000,000, or 32 per cent, from $477,000,000 to $324,000,000. Local aid remained at substantially the same level as preceding years.

FINANCIAL POSITION OF THE STATES

The excellent financial position of the states in 1943 was improved in 1944 and again in 1945, with continued reduction in debt and accumulation of surpluses, although the rate of debt reduction declined in 1945. The 1945 legislative sessions showed more increases than reductions in taxes, indicating increased apprehension concerning the stability of state finances in the post-war period when expenditures must expand, especially in the construction and maintenance of highways and buildings, which were postponed during the war.

State debt, shown in Table IV, reached in 1944 the lowest point since 1931, with a 5 per cent decrease in gross debt and a 7.2 per cent decline in net long term debt. Although the detailed table for 1945 is not available, it is clear that the decline has continued. At the end of 1944 fiscal years, the states had balances in their general, highway, and post-war funds of over $1,640,000,000, an increase of 50 per cent over 1943, according to the Census Bureau, and estimates for 1945 are still higher. In addition, it is estimated that state unemployment compensation trust funds held for the states by the United States Treasury amounted to almost $7,000,000,000 by June 30, 1945. States and their subdivisions purchased approximately $6,657,000,000 in government securities during the war, and still held close to $5,000,000,000 on June 30, 1945.

On the basis of excise collections during the first half of the fiscal year ending on June 30, 1946, it appears probable that total state tax collections will exceed even those of 1945. This increase, which will occur in spite of almost certain declines in income and unemployment compensation taxes, will probably not exceed the relative inflation during the year, so that the real income of the states will not increase further, if indeed it has increased at all since 1942. State expenses are rising rapidly in terms of unit costs, and, especially in the case of salaries and wages, can not be expected to decline for some time. When the amount of deferred maintenance and the increased unit cost are considered, the reserves of the states actually appear scarcely adequate to meet their post-war needs, and realization of this fact accounts

TABLE IV

for the number of rate increases and surveys of state tax systems in 1945.

LEGISLATION

The year 1945 was a "legislative year" for the states, that is, an odd numbered year, in which 44 state legislatures hold regular sessions, compared to only eight in even numbered years. It is no surprise, therefore, that 1945 was a prolific year for state tax legislation. Many states felt the need for additional revenues because of wartime declines in gasoline, motor vehicle license, alcoholic beverages, tobacco, and pari-mutuel revenues, while other states were concerned about surpluses arising from excessive collections of income taxes. The action of the United States Supreme Court in declaring the insurance business to be "commerce" resulted in the abolition of many discriminatory state insurance tax laws; while two states have introduced new methods of taxing interstate airlines as an indirect result of the decision in the *Northwest Airlines* case, discussed in this article in The American Year Book for 1944. Missouri has undertaken the difficult job of rewriting the state statutes to conform to the new Constitution adopted early in 1945, and substantial changes in taxation and tax administration will result.

Most legislation of major importance during the year was the result of a need for increased revenues by certain states. Idaho imposed a new cigarette tax, and three other states increased cigarette tax rates. Higher gasoline tax rates were levied by Idaho, Iowa, Kansas, and Oklahoma. New or additional alcoholic beverage taxes were enacted by Alabama, Arkansas, Florida, Indiana, Massachusetts, Michigan, North Carolina, Oklahoma, Utah, and Vermont. Alabama, Florida, Georgia, and North Carolina adopted new oil and gas production taxes. Seventeen states legislated further to confer special tax benefits on military service personnel, in addition to those granted by previous legislatures.

COURT DECISIONS

Several important constitutional questions were considered by the courts in their adjudication of tax cases during 1945. One of the most significant developments was the ruling by the United States Supreme Court and by several state courts that the Supreme Court decision in the *Southeastern Underwriters* case, discussed in this article in 1944, does not constitute an insurmountable barrier to discriminatory or even retaliatory state taxation of "foreign" insurance companies—foreign in the sense of being chartered by another state. In *Lincoln National Life Insurance Co. v. Read,* decided on June 11, 1945, the Supreme Court affirmed a decision of the Oklahoma Supreme Court sustaining a 4 per cent license tax on foreign insurance companies only, levied as a condition precedent to doing business in the state. The court ruled that "a state may discriminate against foreign corporations by admitting them under more onerous conditions than it exacts from domestic companies." Similar opinions were handed down by the state courts of Michigan and Kansas.

Other constitutional issues considered by the United States Supreme Court were: the classification of interstate corporations as "unitary enterprises," upheld by dismissal of appeals in *Ford Motor Co. v. Commonwealth* and *Quaker Oats Co. v. Commonwealth,* involving the assessment of the tax base for the Pennsylvania franchise tax; the "unbroken package" doctrine, held applicable to imports from the Philippines in *Hooven and Allison Co. v. Evatt,* denying Ohio the power to levy a property tax on such imports in the hands of a corporation purchasing them at a port of entry; and the concept of "doing business" in a state in *International Shoe Company v. State of Washington,* in which the service of process on a foreign corporation was upheld although the sole activity in the state was maintenance of resident salesmen who took orders to be accepted and filled outside the state.

Of interest also are two state decisions invalidating oleomargarine taxes, that of South Dakota because levied for a purpose other than revenue, and that of Nebraska because of an exemption of margarine made from domestic fats, which was held discriminatory.

GENERAL SALES, GROSS RECEIPTS, AND USE TAXES

The long-range increase in collections from general sales and related taxes continued throughout 1945. The rate of increase was the same as the previous year—7.5 per cent—during the fiscal year ended June 30, and the accelerated rate of rise during the later

TABLE V

STATE SALES AND GROSS INCOME TAXES

*Alabama	2% of gross receipts of retail sales, 5% on sale of automobiles; extends to amusements.
Arizona	2% of gross receipts of retail sales of tangible personal property; extends to other kinds of business at rate of 0.25%–2%.
Arkansas	2% of gross receipts of retail sales of tangible personal property; extends to amusements, public utilities, transmission services and printing.
*California	2½% of gross receipts of retail sales of tangible personal property.
*Colorado	2% of gross receipts of retail sales of tangible personal property; extends to public utilities and to meals.
Illinois	2% of gross receipts from retail sales of tangible personal property; 3% on gross receipts of public utilities.
Indiana	0.25% of gross income from wholesale sales; .5% of gross income from retail sales; 0.25% of income from display advertising; 1% of income from other sources.
*Iowa	2% of gross receipts from retail sales of tangible personal property; extends to amusements and public utilities.
*Kansas	2% of gross receipts from retail sales of tangible personal property; extends to public utilities, amusements, meals and drinks.
*Louisiana	1% of gross receipts of retail sales of tangible personal property.
*Michigan	3% of gross receipts of retailers; extends to public utilities.
*Mississippi	2% of gross receipts of retailers; 0.125% of gross receipts of wholesalers; extends to other kinds of business at rate of 0.25%–2.5%. Additional 10% "bootleg" or "black-market" tax on commodities sale or distribution of which is prohibited by law.
Missouri	2% of gross receipts of retail sales of tangible personal property; extends to amusements, public utilities, charges for rooms, meals, and drinks.
*New Mexico	2% of gross receipts of retailers; 0.125% of gross receipts of wholesalers; extends to other kinds of business at 0.25%–1%.
*North Carolina	3% of gross receipts of retailers; 0.05% of gross receipts of wholesalers.
*North Dakota	2% of gross receipts of retail sales of tangible personal property; extends to public utilities and amusements.
*Ohio	3% of gross receipts of retail sales of tangible personal property.
*Oklahoma	2% of gross receipts of retail sales of tangible personal property; extends to public utilities, amusements, and other kinds of business.
*South Dakota	2% of gross receipts of retail sales of tangible personal property; extends to public utilities and amusements.
*Utah	2% of gross receipts of retail sales of tangible personal property; extends to public utilities, amusements, lodgings and meals.
*Washington[a]	3% of gross receipts of retail sales of tangible personal property. 0.25% of gross income of extractors, manufacturers, retailers, printers and publishers, and wholesalers; except wholesalers of grain, 0.01%; miscellaneous businesses and professions, 0.5%; mechanical devices involving skill, 10%, involving only chance, 20%.
West Virginia[a]	2% of gross receipts of retail sales of tangible personal property; extends to services except professional and personal services; 50¢ exemption on food purchases. 0.5% of gross receipts of retailers; 0.15% of gross receipts of wholesalers; 1–6% of gross income of other kinds of business.
*Wyoming	2% of gross receipts of retail sales of tangible personal property; extends to public utilities, amusements, lodging and meals.

[a] Washington and West Virginia have both a retail sales and gross receipts tax.
* Complementary use tax.

months of the calendar year indicate that 1946 will show a still further increase. It should be recognized, however, that most, if not all, of this increase is the result of price inflation, and neither indicates more real value of goods purchased nor more real value of revenues to the states.

Although levied by only 23 states (Table V), sales taxes continued to provide the largest single component of state tax revenues, if unemployment compensation taxes are excepted, producing 14.1 per cent of total tax collections during the fiscal year. The only significant legislation during the year was the repeal of the Colorado Service Tax, an "economy" move of questionable soundness, since the service tax has considerable value in mitigating the regressive nature of the general sales tax. Colorado also abandoned the use of tokens and established a bracket system for collection of the tax. New legislation in Indiana gave the Governor power to appoint the State Treasurer to the position of director of the Gross Income Tax Division, and subjected trading in soy beans to a 1 per cent rate. Utah exempted sales of beer from the sales tax, and South Dakota did the same for motor fuel.

One sales tax case of importance was decided by the California Supreme Court. In *Richfield Oil Corporation v. State Board of Equalization*, the court upheld the imposition of the sales tax on shipments of oil to a foreign purchaser delivered at a tanker in a California port, on the ground that the tax is legally a privilege excise, measured by gross receipts from sales.

GASOLINE AND MOTOR FUEL TAXES

Revenues from motor fuel taxes ended their steady decline of the war years, and stabilized on a slight increase of 1.7 per cent for the fiscal year ended June 30, 1945; with the phenomenal increases in the latter months of the calendar year, it appears possible that collections for the 1946 fiscal year may reach the all-time high of the $942,000,000 of 1942, and it is almost certain that motor fuel taxes will regain the position of largest single current revenue source, held by the general sales tax for the past two years.

Further impetus to increased revenues will be given by the numerous raises in tax rates (Table VI). Idaho eliminated a special 1 mill per gallon tax, and added 1 cent, raising its rate to 6 cents per gallon; Iowa increased the rate from 3 cents to 4; Oklahoma achieved the highest rate of any state, adding 2 cents for a total of 7.5 cents per gallon; and Kansas added 1 cent to the previous 3-cent rate, effective when the Governor finds that moneys available to match Federal aid funds have been fully used; 4 cents remains the modal rate, levied by 20 states, but only eight states and the District of Columbia have lower rates, with Missouri alone at the bottom of the list with 2 cents per gallon.

Minnesota levied an excise tax of 4 cents per gallon on aviation gasoline, but provided refunds up to 3.5 cents on a sliding scale based on the quantity purchased. Rhode Island and South Carolina joined the states granting substantial refunds or exemptions on gasoline used off the highways, but the operation of the law in the Palmetto state was enjoined by the state Supreme Court. Maryland added Diesel fuels and other internal combustion fuels to the taxable list at the same rate as gaso-

STATE TOBACCO TAX RATES

State	Cigarettes	Cigars	Other Tobacco Products
Alabama	1½ mills each*	$1 to $10 per 1,000	Smoking tobacco, 1¢ for each 5¢ or fraction thereof of retail price; chewing tobacco and snuff, ½¢ on each 5¢ or fraction thereof of retail price.
Arizona	2¢ on each 20	5¢ cigars, 1¢ each 3; over 5¢, 1¢ each; small cigars, 2¢ each 20	Tobacco and snuff; 1¢ per ounce; cavendish, plug or twist, ¼¢ per ounce.
Arkansas	$2.50 per 1,000		
Connecticut	1½ mills each		
Florida	2 mills each		
Georgia	1½ mills each*	$1 to $13.50 per 1,000; small cigars, 1¢ per 10	
Idaho	1 mill each		
Illinois	1 mill each		
Iowa	1 mill each*		Cigarette papers; 1½¢ per 50; cigarette tubes, 1¢ per 50
Kansas	2¢ per 20		
Kentucky	1¢ per 10¢ of retail selling price		
Louisiana	2½ mills each	$3 to $27 per 1,000; small cigars, .75 per 1,000	Smoking tobacco, 1¢ per 5¢ of retail price up to 10¢; over 10¢ retail price, 1½¢ per 5¢ of retail price.
Maine	1 mill each		
Massachusetts	2 mills each		
Mississippi	1/5 of 1¢ each	1¢ for each 5¢ of retail selling price	Smoking tobacco, 1¢ for each 5¢ of retail selling price
New Hampshire	15% of retail price	15% of retail price	15% of retail price
New Mexico	1¢ per package of 10; 2¢ per package of 20	1¢ on each cigar retailing for more than 6¢; small cigars, 2¢ on each 20	
New York	1¢ for each 10		
North Dakota	1½ mills each*		Snuff, 2¢ per 1¼ ounce; cigarette papers, ½¢ per 50
Ohio	1¢ per 10		
Oklahoma	2½¢ per 10	$5 to $10 per 1,000; small cigars, 1¢ per 10	Smoking and chewing tobacco, 20% of list price
Pennsylvania	1¢ per 10		
Rhode Island	1 mill each		
South Carolina	1½ mills each	$3–$10 per 1,000; small cigars, 1¢ per 10	Snuff and chewing tobacco, 1¢ per 3 ounces; smoking tobacco, 1¢ per 5¢ of retail selling price
South Dakota	1½ mills each*		Cigarette papers, ½¢ per 50; cigarette tubes, 1¢ per 50
Tennessee	1½ mills each*	$1–$13.50; small cigars, 1¢ per 10	Tobacco and snuff, 5% of retail sales price
Texas	$1.50 per 1,000*		
Utah	1 mill each*		Cigarette papers, ½¢ per 50; cigarette tubes, 1¢ per 50
Vermont	1 mill each		
Washington	1 mill each*		
Wisconsin	1 mill each*		Cigarette papers, ½¢ per 50; cigarette tubes, 1¢ per 50

* Special rates for oversize cigarettes.

line. Several states extended or made explicit tax exemption for gasoline sold to the Federal Government.

TOBACCO TAXES

Revenues from state tobacco taxes fell off in 1945 for the first time in their history as a major state revenue source, the 9.4 per cent decrease being caused by the continued increase in the percentage of tobacco products being sold tax free to the armed forces. This trend was abruptly reversed at the end of the fiscal year, however, and from the tremendous increases in the latter months of the calendar year, it is clear that the all-time high of $160,000,000 in fiscal 1944 will be greatly exceeded by 1946 collections, which may reach the $200,000,000 mark.

Although there was no increase in the number of states levying tobacco taxes (31) during the year (Table VII), one tax has expired, in Delaware, and a new tax was enacted in Idaho. In addition, three states—Connecticut, Florida, and Massachusetts—increased their rates. Oregon enacted a tax of 1 mill per cigarette, but this tax was again defeated by referendum. Wisconsin added a use tax to its already existing cigarette sales tax. In Alabama a new schedule was adopted for the taxation of cigars, reducing slightly the previous rates.

ALCOHOLIC BEVERAGE TAXES

The post-war shortage boom in alcoholic beverage revenues began well before that of tobacco revenues, and produced an increase of 15.4 per cent during the fiscal year ended June 30, 1945. Even larger increases in all except the wine tax field are presaged for the 1946 fiscal year by the sharp climb of tax revenues from distilled spirits and beer in the latter half of the calendar year.

New, additional, or increased taxes were levied in 1945 by 11 states. Michigan joined the ranks of monopoly states levying additional excises by placing a 10 per cent sales tax on spirits containing more than 22 per cent alcohol sold through the state liquor store system. Total tax rates on distilled spirits were increased in Arkansas, Florida, Indiana, Massachusetts, South Carolina, and Vermont; those on beer in Alabama, Florida, Indiana, North Carolina, Oklahoma, and Utah; and those on wine by Florida, Indiana, and North Carolina. Arkansas discontinued its 2 per cent wine sales tax, and West Virginia reduced the permitted alcoholic content of non-intoxicating beer from 5 per cent to 3.2 per cent.

PERSONAL INCOME TAXES

Personal income taxes continued a sharp rate of increase, 10.8 per cent in 1945, but if New York is excluded from the computation, the figure falls to only 2.3 per cent. The slowing of the increase in most states was largely the result of a decline in income payments, but partly the result of deferment of soldiers' tax payments and exemption of military pay in a few additional states. Personal income taxes comprise 6.4 per cent of total tax revenues, compared to 5.8 per cent in 1944.

Legislation in the personal income tax field produced few important changes during the year (Table VIII), with no states being added or dropped from the list of 32 states and the District of Columbia, and no significant rate changes. California increased the personal exemptions from $2,000 to $3,000 and from $3,500 to $4,500 for single and married persons, respectively; Alabama and North Carolina extended the definition of dependents for whom exemptions may be claimed, while Maryland narrowed the definition. California, Iowa, and New York continued the percentage reductions of the tax previously granted; Maryland reduced the credit from 50 per cent to 33 1/3 per cent; and Oregon, which had credits of 75 per cent and 30 per cent in the two preceding years, had none for 1945. Alabama, Arizona, and Connecticut eliminated the necessity of making individual income tax returns under oath.

INHERITANCE, ESTATE, AND GIFT TAXES

Death and gift taxes continued to provide a negligible fraction of state revenues (2.4 per cent) in spite of a substantial percentage increase of 21.1 per cent over 1944. Changes in death tax collections are, of course, so capricious that no conclusions may be

TABLE VIII

STATE PERSONAL INCOME TAXES

State	Rate	Maximum Rate Applies to Income Over	Exemptions		
			Single	Head of Family	Dependents

---

[a] Deduction from tax.

[b] 15% reduction for tax years beginning before Jan. 1, 1947.

[c] Plus 2% surtax on resident's income from dividends, royalties and interest.

[d] In case of dependent father, mother, or grandparent taxpayer may substitute for the $5 deduction from the tax a deduction of $300 in computing net income. 50% credit allowed for taxes payable in 1945 and 1946.

[e] 33⅓% credit allowed for taxes payable on 1944 income.

[f] Exemptions apply against earned income only. In case of income derived from various intangibles there shall be exempt $1,000 "received by a person whose total income from all sources does not exceed $1,000 during the year; but said exemption shall not be given to any married person if the combined income of both husband and wife from all sources exceeds $1,500."

[g] 25% discount allowed against taxes payable on 1944 income.

[h] Plus surtax on interest and dividends of 3% on income between $500 and $800, 4% on income between $800 and $12,000, 5% on income over $12,000. Exemption for surtax only is $500.

[i] If income is derived wholly from interest and dividends, personal exemptions shall be $400 for single persons and $800 for married persons except when entire net income exceeds $1,500 for single persons and $3,000 for married persons.

[j] Includes $200 single and $300 head of family unqualified deduction for medical expenses and insurance.

drawn from the increase. No legislative changes during the year were of great significance, and no changes have been made in Table IX. Arkansas and New Mexico enacted new estate taxes to cover any part of the Federal credit not taken by their inheritance taxes. Arkansas also exempted from death taxation the intangibles of non-resident decedents, and five states—Illinois, Nebraska, Oklahoma, South Dakota, and Texas—enacted laws providing for reciprocal exemption of such intangibles.

CORPORATION INCOME TAXES

The increase in revenue from corporation income taxes and franchise taxes, measured by net income, fell off sharply in 1945, amounting only to 3.1, compared to 10 times that steep a rise (31.2 per cent) in the preceding year. If New York is excluded, the result is a decline of 6.8 per cent instead of the small increase, showing that most states have already felt the impact of cutbacks and cancellation of war contracts.

The only rate change was the enactment by Massachusetts of an additional 2.5 per cent tax on the net income of corporations for 1946, making a total basic rate of 5 per cent (Table X). Pennsylvania imposed a tax at the same rate as the existing corporation income tax (4 per cent) on cooperative agricultural associations which heretofore had been largely tax-exempt. Neither Maryland nor Oregon allowed any credit against the total tax due, but California continued its 15 per cent credit. Many other technical changes deal with depletion allowances, loss carry-back, renegotiated income, charitable deductions, and allocation of tax bases.

MISCELLANEOUS TAXES

The most significant development in other tax fields was the enactment by 24 states of insurance tax amendments eliminating discrimination against foreign insurance companies, assumed to be necessary because of the *Southeastern Underwriters* decision. It will be interesting to observe in future legislative sessions how many of these discriminatory taxes are resurrected under the terms of the *Lincoln National Life Insurance Company* case discussed above in the section on "Court Decisions."

In the bank tax field, the only addition to Table XI is Vermont, which levied a 2 per cent tax on state and national banks, replacing the former tax measured by deposits. No important changes in chain store taxes were enacted (Table XII).

In the property tax field, Michigan provided for taxation of intangibles having a business situs in the state on the basis of an allocation formula; Minnesota suspended permanently its

TABLE IX

ESTATE TAXES

State	Rate	Exemption
Alabama	4/5–16	$100,000
Arizona	4/5–16	100,000
Colorado	4/5–16	100,000; tax levied only if estate exceeds $250,000

[a] Exemption of $1,000.

[b] Minimum tax of $25. 15% credit allowed against bank and corporation franchise taxes for 1945.

[c] $10 minimum; tax is not to be less than one mill on sum of interest bearing debt, capital stock, surplus, undivided profits, and reserves, less deficit and stocks and securities held.

[d] Tax is not to be less than 2 per cent of entire net income plus compensations to officers and to stockholders owning in excess of 5 per cent of the stock after deducting $10,000 and deficit if any.

[e] Exemption of $3,000.

[f] Minimum is not to be less than 1/20 of 1 per cent on capital stock. Additional tax of 10% of tax computed, extended through 1946.

[g] Exemption of $1,000.

[h] Minimum tax of $5. Corporations ceasing to do business in state pay 3% on last year's net income.

[i] 3% on income from dividends. Maximum tax of $25, or 1 mill per dollar on capital stock.

[j] Minimum tax of $10.

[k] Minimum tax of 3 per cent of net income plus salaries and compensation paid to officers and to any stockholder owning in excess of 5 per cent of capital stock after deducting $6,000 and any deficit reported for the year.

[l] Or tax on capital stock, whichever is greater.

[m] Minimum tax of $10, tax is not to be less than 1/20 of 1 per cent of value of tangible property.

[n] Plus certain surtaxes.

tax on money and credits; Missouri adopted a new constitution providing for a classified property tax and taxation of intangibles on an income basis; and New Jersey exempted intangibles from the general property tax. Minnesota adopted a formula for allocating the flight property of airlines according to the recommendations of the National Association of Tax Administrators, rather than those of the Civil Aeronautics Board. The United States Supreme Court ruled in *City of Cleveland v. United States* that low cost housing projects owned by an instrumentality of the Federal Government are exempt from local property taxation. Finally, the repeal of the Georgia poll tax as a result of a campaign by Governor Arnall should be noted, though of little revenue significance.

ADMINISTRATION

The new Missouri constitution provides for a Department of Revenue, which is to be charged with the administration and collection of state taxes collected in the past by three or four major state agencies and half a dozen minor ones. The integrated administration made possible by this change should improve efficiency and completeness of collection. Other aspects of financial administration are similarly improved. In Maine, many functions in tax administration, heretofore performed by other officials, were transferred to the State Tax Assessor, and this move also is expected to improve efficiency and economy in tax administration.

The movement for thorough surveys of state tax systems continued with increased impetus, and approximately one-half the states have comprehensive studies under way or recently completed. Notable among these are the studies, undertaken early in 1946 by committees in Arkansas and Florida, looking toward the study and necessary revision of the entire state tax system.

TABLE XI

STATE TAXES ON THE NET INCOME OF BANKS

MUNICIPAL FINANCE

By H. K. Allen

Director, Bureau of Economic and Business Research,
University of Illinois

GENERAL

An examination of the financial condition of municipalities for the year 1945 shows definite signs of a continuation of the improvement which began in 1944. This further improvement is indicated especially by a decline in tax delinquencies, and a decrease in the number of defaults. As might be expected, war has made an imprint upon municipal finance. Among the most conspicuous of these effects are the reductions in expenditures for welfare and outlays.

EXPENDITURES

The most recent year for which the comprehensive per capita statistics of the Bureau of the Census in final report form are available is for 1942.

PER CAPITA EXPENDITURES

While some of the absolute expenditures just noted may appear large, yet too great significance should not be attached to them. The size of an expenditure becomes intelligible in terms of service when one discovers

1903...........	278,173	30,842	71,020	25,807	34,208

[1] Statistics for 1932 to 1942 are for cities having a population over 100,000. All other data are for cities over 30,000. Because of some changes in the basis of classification, the figures for 1937, 1938, 1939, 1940, and 1942 are not strictly comparable with those for earlier years. Beginning with 1937, the financial statistics of public-service enterprises were reported separately from those of general government.

Year	Charities, Hospitals, and Corrections	Schools	Libraries	Recreation	Miscellaneous
1942...........	$345,841	$377,123[1]	$21,339	$55,737	$ 31,014

* Payment for pensions are included in column "Miscellaneous" for the years 1911 to 1928 inclusive; for the years 1903 to 1909 inclusive, they are included with expenses of police, fire, and school departments.

** Payments for expenses of art galleries and museums are included in column "Recreation" for the years 1911 to 1928 inclusive; for the years 1903 to 1909 inclusive, they are included with the expenses of libraries; expenditures for libraries and schools are combined for the years 1932 to 1935.

items, it is interesting to note that expenditures for education have always been larger than any other, and that the relative importance of this item up to 1932 tended to increase with the years. The most significant development in recent years, it will be noted, is the increase in expenditures for charities, hospitals, and corrections. The following table shows the relative importance of the different services over a period of years.

PERCENTAGE OF EXPENDITURES FOR DIFFERENT FUNCTIONS

Year	General Govern-ment	Public Safety	Health and Sani-tation	High-ways	Charities, Hospitals, and Correc-tions	Educa-tion Schools*	Libra-ries*	Recrea-tion	Miscel-laneous

VII. PUBLIC FINANCE AND TAXATION

SOURCES OF REVENUE

Property Taxes.—The revenue of cities arises from a number of sources. In most cities more than 90 per cent of the funds which go into the general revenue fund come from the general property tax. This is a tax levied against real and personal property. In addition to the general property tax the Census Bureau designates certain taxes as special property taxes. Such include taxes upon the capital stock of corporations, upon savings banks and other financial institutions, and upon insurance companies. Included in this, also, would be taxes levied upon mortgages at time of recording, taxes upon incomes and estates, upon investments, and a wide range of specific taxes.

Poll and Business Taxes.—In many cities, also, some form of poll tax continues to be used, although such taxes are much less important than formerly. No generalization can be made as to method of levy since this varies greatly from city to city. In addition, business and non-business license, taxes make up a large group of levies upon different types of business activities, some of which, of course, are levied primarily for regulative purposes. The latter include such levies as those upon dogs, dance halls, etc. Receipts from special assessments constitute an important item, but they do not enter the general revenue fund. In some places, at a particular time, subventions and grants are an important source of income, while in some cities, also, the earnings from public enterprises are not unimportant. The relative importance of the major sources of revenue over a period of years is shown in the following table.

PERCENTAGE OF RECEIPTS FROM DIFFERENT SOURCES OF REVENUE

Year	The General Property Tax	Other Taxes and Licenses	Special Assessments	Subventions and Grants, Donations and Pension Assessments	Earnings of Public Service Enterprises[2]	Other Revenues
1942[1]	65.2	9.8	1.2	17.4	....	6.4
1940	63.4	7.7	1.0	18.3	....	9.6
1938	64.7	8.1	1.1	16.1	....	10.0
1936	59.7	7.9	1.6	14.3	10.4	6.1

[2] Listed separately in years 1937 to 1942.

revenue they have had to resort to borrowing.

In the calculations of the Census Bureau, municipal indebtedness is divided into two distinct groups—long-term obligations and short-term loans. The former includes all obligations which have a number of years to run and for the redemption of which no assets other than a sinking fund or earnings of public-service enterprises have been specifically designated. The latter, on the other hand, includes such indebtedness as is evidenced by warrants, accounts payable, and other short-term obligations. The adjoining table shows the net indebtedness for certain years.

MUNICIPAL INDEBTEDNESS

(000 omitted)

Year	Net Long-Term Debt	
	Amount	Per Capita
1943[1]	$6,451,536	$169.86
1940	6,746,826	177.60
1938	6,470,850	171.23
1936	6,331,516	168.13

1907	1,808,878	56.04
1903	933,004	44.71

[1] For all cities having population of more than 25,000. Statistics for years 1932 to 1940 are for cities having a population over 100,000. For years prior to 1932, data are for cities over 30,000.

DEVELOPMENTS IN THE BOND MARKET

The aggregate disposals of long-term obligations by state and municipalities for the first ten months of each year for a series of years are shown in the following table. Total issues for the months covered increased from $641,779,000 in 1944 to $671,251,000 in 1945.

FEDERAL EMERGENCY ADMINISTRATION OF PUBLIC WORKS

The table showing municipal bond issues does not include the extension grants made to municipalities for public works projects by the Federal Emergency Administration of Public Works. This agency was created by the National Industrial Recovery Act which became effective June 16, 1933. Under Title II of this Act, authority was granted to the Administrator to

MUNICIPAL BOND ISSUES

(000 omitted)

Year	Total First Ten Months	Year	Total First Ten Months
1945	$ 671,251	1928	$1,094,074

furnish grants, not subject to repayment, for 30 per cent of the total expenditures incurred for the payment of labor and material costs on approved public works projects. Moreover, the agency was authorized to accept 4 per cent general obligation or revenue bonds of the municipalities as security for the loan portion of the allotment. In 1934 Congress authorized the Reconstruction Finance Corporation to purchase marketable securities from the Public Works Administration and provided that moneys realized by the Public Works Administration from such sales might be used for making additional loans, but not grants, in aid of non-Federal public-works projects under Title II of the N.I.R.A.

In addition to the program of public works administered under Title II of the National Industrial Recovery Act, the Public Works Administration carried on a separate program pursuant to the Emergency Relief Appropriation Act of 1935. Under the latter act the amount of the grant was fixed by administrative determination at 45 per cent of the cost of the project, with a corresponding reduction in the amount to be furnished by the applicant. Provision was made under this act for the sale of bonds acquired as collateral for municipal loans either on the open market or to the Reconstruction Finance Corporation, the proceeds to be used only for the making of loans. In practice the sales were confined to the Reconstruction Finance Corporation which, in turn, sold the securities on the open market.

TAX DELINQUENCY

Tax delinquency is a natural phenomenon of a business depression, and a rising trend of tax delinquency inevitably cripples municipal functions and weakens municipal credit. During periods of prosperity, on the other hand, tax delinquency drops sharply. Dun and Bradstreet has made a study of the trend of median year-end tax delinquency in 150 cities over 50,000 population for the 13-year period from 1930 to 1944. The following percentages show the median delinquency on the current tax levy at the end of each fiscal year:

1944	3.90%	1936	13.9%
1943	4.70%	1935	18.0%
1942	6.00%	1934	23.05%
1941	6.80%	1933	26.35%
1940	8.70%	1932	19.95%
1939	9.25%	1931	14.60%
1938	10.7%	1930	10.15%
1937	11.3%		

These figures show a substantial gain in collections since 1933, and delinquency in 1944 was lower than it was in 1930. Only fragmentary data are available for 1945, but it is believed that little change has occurred.

DEBT DEFAULTS

The *Bond Buyer* estimated, with certain reservations, that 152 cities and towns were in default on their bonds on Dec. 1, 1945. This represents a slight reduction from the previous year when 158 incorporated places were in default. The following states, according to the *Bond Buyer,* had the largest number of defaults:

Florida	57	Colorado	9
Texas	23	Michigan	7
Pennsylvania	11	Oklahoma	5
North Carolina	11	Minnesota	4

It is significant to note that Florida and North Carolina, which are included in the above group, had large increases in local indebtedness between 1912 and 1932, the percentages being 2,779.01 and 1,300.8 respectively. The indebtedness of Maine during the same period increased only 73.2 per cent, while that of Massachusetts increased only 99.2 per cent. Maine had one incorporated place in default in 1944, and Massachusetts had none.

While no data are available regarding the volume of municipal bonds in default, it can reasonably be stated that the volume of such defaults declined during 1945.

DEBT ADJUSTMENT LEGISLATION

For the purpose of aiding municipalities which are in default on their obligations, various states have recently passed state receivership and debt adjustment acts. Boards or commissions have been established to supervise local indebtedness in general, to supervise the refunding of municipal bonds, and to act as receivers in event of failure to meet debt service.

A Federal Municipal Bankruptcy Act was enacted May 24, 1934. This act, which was declared unconstitutional by the Supreme Court of the United States in May, 1936, was designed to enable any taxing district, with the consent of its creditors and the approval of a Federal District Court, to adjust its debt structure. According to the *Bond Buyer*, only 27 cities, one county, one school district, 41 irrigation districts, and one road district filed petitions under the Municipal Bankruptcy Act during the two years which the law was in effect.

On Aug. 16, 1937, President Roosevelt signed a new Municipal Bankruptcy Act, designed to replace the original measure which was declared unconstitutional. The present law is similar in its provisions to the invalidated law. It provides a procedure whereby insolvent taxing agencies, such as local drainage, levee, irrigation, road, and sewer districts, as well as towns, boroughs, and municipalities, may effect compositions with their creditors. These compositions are approvable only when the districts or agencies file voluntary proceedings in bankruptcy accompanied by plans approved by 51 per cent of all the creditors of the district or town. The plan of composition can not be confirmed unless accepted in writing by creditors holding at least 66 2/3 per cent of the aggregate amount of the indebtedness of the petitioning district or taxing agency, unless the judge is satisfied that the taxing districts were authorized by law to carry out the plan and there had been a finding by the Court that the plan was fair, equitable, and for the best interests of the creditors. According to the *Bond Buyer*, 275 municipalities had filed petitions under the 1937 Federal Municipal Bankruptcy Act on Dec. 1, 1945.

FEDERAL INCOME AND PROFITS TAXES

By Mark Carter Mills
Associate Professor, Indiana University

INCOME TAX LEGISLATION

Two revenue acts were passed by Congress in 1945. The first, called the Tax Adjustment Act of 1945, was passed in July; the second, the Revenue Act of 1945, enacted early in November, was much broader in scope than the earlier act and, in some respects, superseded it. The Adjustment Act was primarily concerned with specific problems of reconversion, while the later law was concerned with the more general aspects of the situation that had developed with the end of hostilities. Both measures became effective Jan. 1, 1946.

TAX ADJUSTMENT ACT OF 1945

The general purpose of the Tax Adjustment Act, which was passed in

July, after the end of hostilities in Europe but before the Japanese surrender, was to make available to businesses certain credits or refunds, which would not otherwise have been available, for periods ranging up to a maximum of six years after the war. This provision was designed primarily as an aid to reconversion by smaller businesses. A further provision of the law designed to aid smaller businesses was to increase the excess profits tax exemption from $10,000 to $25,000, beginning in 1946.

In providing that post-war excess profits tax credits should be made currently available, a distinction was made between the years 1942 and 1943 on the one hand and the period beginning in and following 1944. For the earlier years the post-war credit was made available on Jan. 1, 1946, by providing that the refund bonds issued in connection with the withheld amount of excess profits tax become redeemable at the option of the taxpayer. For the later period the post-war credit was made currently available to be used as a reduction in the amount of excess profits tax to be paid. This provision had the effect of reducing the former 95 per cent excess profits tax with 10 per cent of it withheld for a number of years after the war to a straight 85½ per cent tax. A further provision of the law provided for speeding up refunds from carry-backs of losses and unused excess profits credit. Since the Revenue Act of 1945 abolished all excess profits taxes beginning Jan. 1, 1946, the most important provision of the Tax Adjustment Act, which was to increase the excess profits tax exemption from $10,000 to $25,000, lost its significance. Other than this provision, the law was in no sense a tax reduction act but rather provided a means by which refunds already provided for would be paid more quickly and thus aid in the process of reconversion.

POST-WAR TAX POLICY

Long-range problems of post-war tax policy continued to be widely discussed during 1945 with an added emphasis upon Federal taxation as a means of encouraging business and promoting employment. Since the two principal Federal taxes affecting business are the excess profits tax and the corporate net income tax, special attention was given them. It was generally recognized that in many respects the problem of formulating a workable post-war program was more difficult than the problem of war taxation. While it is true that the amount to be collected will be much less than during the war years, nevertheless it will be necessary to raise at least three times as much as the Federal tax receipts prior to the war.

The most important and widely publicized of the group plans for post-war tax policy offered during the year was that of the Committee on Post-war Tax Policy of which the chairman was Roswell Magill, former Under-Secretary of the Treasury, and the Director of Research, Dr. Harley L. Lutz. The proposals of the Committee were embodied in a book, *A Tax Program for a Solvent America.*

The Committee on Post-war Tax Policy differed from most of the earlier groups offering tax programs in that it did not attempt to estimate the future national income. What it did do was to offer three budgets of $15,000,000,000, $18,000,000,000, and $22,000,000,000 based upon assumptions of national incomes of $115,000,000,000, $125,000,000,000, and $140,000,000,000. Making maximum employment its goal, the Committee suggested alternate plans of raising revenue to fit the assumed situations. Also differing from most of the other groups, the Committee recommended, that the Federal budget be balanced annually rather than over the business cycle. In general, it may be said that the Committee believes in a widely diversified revenue system.

More specifically the Committee recommended that the 3 per cent normal tax on individuals be abolished but that surtaxes starting at 15 per cent to 20 per cent, depending on the size of the budget, be retained; the excess profits tax be repealed but with the provision that the carry-back of unused excess profits credits be retained for two years; the regular corporation tax rates approximate those set for individual incomes; estate and gift taxes be collected only by the states; the method of taxing capital gains be left unchanged for at least five years; substantial levies on excises be retained as part of the Federal revenue system to add stability of yield under changing economic conditions; and in case of a budget of as much as $22,000,000,000, a 5 per cent sales tax should be levied to avoid deficit financing.

THE TREASURY PROGRAM

Secretary Vinson presented the Treasury program before the Ways and Means Committee of the House on Oct. 1. In making his proposals the Secretary made it clear that what he was proposing was a specific program for the year 1946 and not a long-range program for the whole post-war period. He said: "After climbing the mountain of war taxation in 1940, 1941, 1942, and 1943, and moving along the crest during 1944 and 1945, we are now in the fortunate position of being able to go a little way down the other side. We did not reach the peak of wartime taxation in one revenue act; it took five major acts in four years. I am sure we all agree that more than one step will be necessary to convert the wartime tax system into a post-war system."

Secretary Vinson's proposals were based on the assumption that, if the prevailing rates were kept in effect, the total tax receipts of the Government of $46,500,000,000 in the fiscal year 1945 would decline to $36,000,000,000 for the fiscal year 1946. He presented further Treasury estimates that, under the existing law, the tax receipts for the calendar year 1946 would be $32,500,000,000. Considering all factors involved, it was Secretary Vinson's judgment that total reductions resulting from revision of the tax laws should not exceed $5,000,000,000 for 1946.

In proposing the measures involved in the Administration program, the Secretary pointed out that the situation was paradoxical in that there were threats of both inflation and deflation and that in so far as possible the tax program should be formulated in such a way as to prevent both. He pointed out that, although the excess profits tax had been a major source of revenue since the tax was imposed in 1940, it had never been viewed primarily as a revenue measure but as a means of preventing war profiteering and as a control measure. He believed, however, that with the end of the war the excess profits tax could be eliminated as a control measure and that in spite of the loss of revenue to the Treasury, should be abolished as an obstacle to the reconversion and expansion of business necessary for a high level of employment and income. He also pointed out that there had always been difficulty in distinguishing between normal and excess profits and that this would become still more difficult in time of peace when the tax was no longer needed as a method for preventing wartime profiteering.

Although the problem of excess profit taxation has been considered as a problem of big business, Secretary Vinson said that Treasury studies showed that in 1943 over 70 per cent of the corporations subject to income profits taxes had net incomes of less than $100,000. He also said that in 1943 one-third of the corporations with incomes of $1,000,000 and over did not have taxable excess profits. As a result, the repeal of the excess profits tax would give relief to corporations of all sizes and not merely to large businesses. He estimated that, at the level of profits expected for 1946, the yield for the excess profits tax would be $2,555,000,000 if the law were left unchanged.

In the case of the individual income taxes, Secretary Vinson proposed elimination of the 3 per cent normal tax on individuals effective Jan. 1, 1946. He estimated that this would remove about 12,000,000 low income persons from the tax rolls and reduce burdens for all individuals by $2,085,000,000. He proposed that graduated surtaxes should be left in force at present rates. Secretary Vinson also proposed a sharp reduction in wartime excise taxes to be made effective July 1, 1946. He estimated this would reduce the consumer tax burden by $547,000,000 annually. He also favored a temporary freeze of social security taxes at present rates.

In brief the chief Treasury proposals were: 1. to drop the 3 per cent "normal" tax on individuals effective Jan. 1, 1946; 2. to repeal the 95 per cent excess profits tax on corporations also effective on the same date; 3. a sharp reduction in excise taxes on consumer goods to take effect July 1, 1945; and 4. a temporary freeze of social security taxes at present rates.

TAX PLANS IN CONGRESS

The tax bills reported by the Ways and Means Committee of the House and the Senate Finance Committee were in substantial agreement with each other on major issues and not far different in approach from the Treasury plan submitted a few days earlier by Secretary Vinson.

The most important features of the Ways and Means Committee proposals were as follows: 1. to lessen the impact of the 3 per cent normal tax on individual incomes by allowing exemptions of $500 for each family member instead of $500 for each taxpayer and to cut each surtax bracket by four percentage points with the proviso that each taxpayer should have at least a 10 per cent reduction in his total tax; 2. to reduce the excess profits tax on corporations from 85.5 per cent to 60 per cent and the normal and surtax rates from 40 per cent to 36 per cent and repeal the capital stock and declared-value excess profits tax; 3. to set July 1, 1946, as the date of expiration of the $5 automobile "use" tax and of the wartime increases in excise taxes and to refund floor stock taxes paid by merchants on goods already in inventory when the excises were abolished; and 4. to freeze social security payroll taxes at 1 per cent each on employers and employees for another year.

The Senate Committee agreed completely on freezing the social security taxes on the repeal of the automobile "use" tax and on the repeal of the capital stock and declared-value excess profits tax. The Senate went further than the House in proposing cuts in the wartime excises.

The major disagreement between the two houses was on corporation taxes. The Senate proposed complete repeal of the excess profits tax on Jan. 1, 1946 with no changes in normal tax or surtax. On individual income tax rates there was major agreement. Both proposed to retain the 3 per cent normal rate but to apply the existing surtax exemption in its calculation. The two bills were sent to a conference committee to be brought into final agreement.

THE REVENUE ACT OF 1945

General Purpose.—The Revenue Act of 1945 was notable in that it was the first Federal tax law in 16 years designed to reduce the amount of revenue to be collected. In its final form the act represented a compromise between the plans offered by the Treasury, the Ways and Means Committee of the House, and the Senate Finance Committee but offered a greater reduction in total revenue than any of the separate plans. Secretary Vinson had asked for a reduction in taxes of $5,000,000,000 while the bill as signed by President Truman was planned to reduce taxes in 1946 on individuals by $2,644,000,000 and on business by $3,136,000,000 for a total of $5,920,000,000, with an estimated additional relief of $140,000,000 to result from the repeal of the automobile and motorboat "use" taxes.

Individual Income Tax.—The normal tax rate of 3 per cent was retained but the exemption for the normal tax was made the same as that for the surtax—$500 for each taxpayer and for each dependent—instead of a single $500 exemption. This provision, it was estimated, would entirely exempt 12,000,000 low-income taxpayers who were subject to the tax in 1945. Surtax rates were lowered three percentage points in each bracket. The effect of this was to make the surtax rate 17 per cent on the first $2,000 of income subject to the tax with a top rate of 88 per cent on surtax net income over $200,000 in place of the former rates ranging from 20 per cent to 91 per cent. On top of this, individual taxpayers were allowed a flat reduction of 5 per cent in the total normal and surtax after it had been computed by the new method. The withholding method of collecting taxes on wages and salary incomes was retained with the use of new withholding tables. Veterans were given preferred treatment by making all service pay received by enlisted men tax free for any year after Dec. 31, 1940. Both officers and enlisted men were given three years from the time of discharge to pay back taxes without penalty on delinquencies.

Individual Income Taxes.—The effect that the Revenue Act of 1945 will have on the incomes of married persons with two dependents is shown in the following table:

Net Income Before Exemptions	Total Tax on 1945 Income	Total Tax on 1946 Income
$ 500	$ —	$ —
600	3	—
800	9	—
1,000	15	—
1,500	30	—
2,000	45	—
2,500	160	95
3,000	275	190
4,000	505	380
5,000	755	589
7,500	1,440	1,169
10,000	2,245	1,862
25,000	9,705	8,522
50,000	26,865	24,111
100,000	68,565	62,301
250,000	207,985	190,475
500,000	442,985	406,600
1,000,000	900,000	838,850

Corporation Income Tax.—Normal corporation income tax rates were left unchanged. Surtax rates on the first $25,000 of net earnings of corporations, making less than $50,000, were reduced from 10 to 6 per cent. On corporate net income above $50,000, surtax rates were reduced from 16 to 14 per cent. The new rates on corporations apply to income received in 1946 and are payable in 1947.

Excess Profits Tax.—The excess profits tax was repealed as of Jan. 1, 1946 after which date corporate income is subject only to normal tax and surtax. However, unused excess profits credit for 1946 may be carried back to reduce excess profits taxes for 1944 and 1945. The object of this provision was to allow wartime earnings to be applied to reconversion expenses.

Capital Stock Tax.—The capital stock tax and the declared-value excess profits were repealed as of June 30, 1945.

Social Security Tax.—Other provisions of the law froze payroll taxes for old-age retirement at the existing rate of 1 per cent on employers and 1 per cent on employees.

Automobiles and Motorboats.—The "use" tax on automobiles and motorboats was repealed as of July 1, 1946.

UNSETTLED ISSUES

In enacting the Revenue Act of 1945, Congress made it clear that no further tax legislation affecting 1946 incomes, either individual or corporate, might be expected. However, a number of unsettled problems and contested issues are expected to become objects of Congressional study in 1946, with the prospect that further tax legislation will be enacted to apply in 1947. Some of the objectives of such legislation will be relatively minor changes in existing laws such as lowered rates on individual incomes if warranted by declining revenue needs.

Other objectives will be those concerned with general economic reforms to which it is believed tax measures may contribute. Among such proposals are those designed to encourage expenditures for business expansion and which would put a penalty upon the accumulation of undistributed profits. Other proposals for further consideration have been to abolish taxes on individual incomes under $3,000 and to repeal all Federal excise taxes in order to increase consumer buying power.

Among the most controversial of pending issues is that of taxing currently untaxed-non-profit organizations of which the most important are the labor unions and the farm cooperatives. A Treasury study of non-taxed organizations reporting income for 1943 was made public late in 1945 and showed that in 1943 there were 86,784 such non-taxed organizations with reported gross incomes of $6,159,000,000. Of this income $4,034,000,000 was from business activities which were in many instances similar to those carried on by competing firms that did pay taxes. Most important of these activities were those carried on by the farm cooperatives which, under existing laws, are not taxed on the sums which they pay out as patronage dividends.

Mutual savings banks, mutual insurance companies, building and loan associations, and similar organizations reported total income of $1,085,000,000, mainly from business activities and investments.

Other non-profit groups reporting were consumer cooperatives, educational and charitable institutions, and trade associations.

The current issue over taxing the non-taxable organizations has largely been precipitated by the rapid expansion of the cooperative movement into fields in which the cooperatives are in direct competition with businesses which are subject to ordinary corporation taxes. The expanding business activities and increasing investments of the labor union have also contributed to the demand for further Congressional investigation.

IMPORTANCE OF INCOME AND PROFITS TAXES

Total budgetary receipts of the United States Government for the fiscal year 1945 amounted to $47,700,000,000 as compared with $45,400,000,000 in 1944, an increase of $2,300,000,000. The major importance of income and profits taxes is shown by the fact that receipts from these sources amounted to $33,000,000,000 in 1944 and to $35,000,000,000 in 1945. The growth in yield of income and profits taxes over a ten-year period is shown in the following table:

INCOME AND PROFITS TAXES 1936-1945

(In Thousands of Dollars)

Fiscal Year	Total Income and Profits Taxes	Individual	Corporation Income and Excess Profits	Miscellaneous Profits Taxes
1936	1,427,446	674,416	738,521	14,509
1937	2,179,828	1,091,741	1,056,909	31,178
1938	2,629,030	1,286,312	1,299,932	42,786
1939	2,185,114	1,028,834	1,122,541	33,740
1940	2,129,609	982,017	1,120,582	27,010
1941	3,471,124	1,417,655	2,016,297	37,172
1942	8,006,884	3,262,800	4,687,462	56,621
1943	16,298,888	6,629,932	9,584,715	84,241
1944	33,027,802	18,261,005	14,629,344	137,452
1945	35,061,526	19,034,313	15,883,235	143,978

LAND AND PROPERTY TAXES

By Robert W. Lochner
Attorney at Law, Rochester, New York

GENERAL

The increasing importance of real estate tax reduction is emphasized by the addition of seven new state committees or commissions appointed to study tax revision (Alabama, Nebraska, New Hampshire, New Jersey, Oklahoma, Oregon, and Vermont).

The New York State Commission on Municipal Revenues and Real Estate Tax Reduction filed its first report in March, 1945, and will report to the next Legislature on an extensive revision of state assistance designed to promote real estate tax reduction.

The termination of the war focussed the legislative spot-light on post-war tax plans, veterans' relief and exemptions, and expanding tax-supported state and municipal functions.

As a result of the Supreme Court decision upholding Minnesota in taxing the entire airplane fleet of Northwest Airlines (Northwest Airlines *v.* Minnesota, 322 U. S. 292, the Civil Aeronautics Board in a report to Congress (April 10, 1945) recommends state taxation of airplane fleets on an apportionment-between-states basis. Indiana permitted cities of 300,000 to create Departments of Redevelopment to improve blighted areas, with special taxing powers (C. 276, L. 1945). North Dakota will vote on the establishment of a Post-War Rehabilitation Reserve Fund to be supported by a two-mill levy for ten years (S.C.R. No. 9, L. 1945). Michigan voters will pass upon a constitutional amendment permitting a 15-year increase in tax limitation, from 1½ per cent to 3 per cent upon vote of a majority of qualified property owners for acquiring real estate or erecting or improving public works (Sen. Jt. Res. A, 1945).

LEVIES

Ohio's *ad valorem* tax on hemp and other fibers in original containers was invalidated by the United States Supreme Court (Hooven & Allison Company *v.* Evatt, 89 L. E. 852). Michigan has imposed a two-mill tax per 100 pounds of grain held by dealers, processors, or warehousemen to be collected in the same manner as the general property tax (P.A. 33, L. 1945).

Colorado authorized its counties, cities, and towns to levy a one-mill tax for a post-war improvement fund (H.B. 530, L. 1945); Kansas authorized cities of the second class to levy a one-mill tax for municipal airports and aviation purposes (C. 6, L. 1945); North Dakota, a three-mill tax for cities for airport purposes (S.B. 155, L. 1945); and Delaware removed levies for airport improvement from its tax limitations (S.B. 162, L. 1945).

Illinois added a two-mill tax in park districts for five years, and thereafter one-mill, to be used for repairing drives, parks, swimming pools, and community centers (S. B. 8, L. 1945). North Dakota authorized a one-mill tax for counties to advertise their resources and to promote industrial development (S. B. 177, L. 1945).

Oklahoma authorized a one-mill tax to provide loans to war veterans for the acquisition of farms and homes (C. 403, L. 1945).

Wyoming will permit its electors to vote a two-mill tax for vocational and adult education (H.B. 83, L. 1945).

EXEMPTIONS

Following a movement begun in 1944 to remove constitutional and legislative barriers to taxation of federally owned property in cases where Congress has waived its immunity, seven states adopted legislation permitting taxation of federally owned property (Connecticut, Maine, Maryland, New Hampshire, Pennsylvania, Utah, West Virginia), and Washington will vote on a constitutional amendment to accomplish the same end (H.J.R. 9, L. 1945). New Jersey authorized the receipt of such taxes in lieu of payments from the Federal Government (C. 66, L. 1945).

The United States Supreme Court has affirmed the exemption from taxation of real estate purchased by the United States and devoted to low cost housing (Boyle, Deputy Treasurer, *et al v.* United States of America and Federal Housing Authority, 89 L. E. 270).

Veterans' exemptions were extended and enlarged in several states. Connecticut exempted veterans from all interest and other delinquent charges on property taxes during their term of service (C. 247, L. 1945), Georgia, from Jan. 1, 1941 to six months after discharge or war termination (H.B. 121, L. 1945), and South Dakota for six months after discharge (S.B. 209,

L. 1945). Idaho exempted veterans' property for the war period and six months after discharge.

Arkansas enlarged and liberalized its homestead exemption from $1,000 to $2,000 (H.B. 318, Act 205, L. 1945).

Social and literary associations affiliated with a college or university were accorded full exemption in Alabama (H.B. 103, L. 1945), while Florida clarified its education and charitable exemption to make such institutions subject to assessments for sidewalks, curbing, street paving, or other local improvements (H.B. 1005, L. 1945).

South Carolina extended to June 11, 1946 its exemption of property of cooperatives (H.B. 161, L. 1945), and North Carolina broadened its exemption accorded to American Legion Posts to include any veterans' organization (H.B. 924, L. 1945).

ASSESSMENTS

Illinois now requires full, fair cash value assessments and equalization by the Department of Revenue, and the establishing through analysis of property transfers and appraisals of an assessed value, which shall be the full, fair cash value of the property (S.B. 229, L. 1945).

Taking account of recent hurricane damage, New Jersey now provides for the revaluation of property where value has been depreciated by storm, fire, or other casualty after Oct. 1 and before Jan. 1 (C. 260, L. 1945).

ADMINISTRATION

Assessors in Massachusetts may no longer hold the office of collector of taxes (C. 136, L. 1945). South Dakota authorized the appointment of a Delinquent Tax Collector to be paid by commission not exceeding 10 per cent of the taxes collected (S. B. 268, L. 1945).

Oklahoma substantially revised its tax collection and return calendar (S. B. 122, L. 1945), while Pennsylvania made many changes in its tax lien dates, tax sale redemption provisions, and installment payments of delinquent taxes (Acts 24, 263, 386, 394 and 429, L. 1945).

Vermont omitted the oath from tax returns while attaching the penalties of perjury to false statements contained therein (S.B. 71, Laws of 1945).

CORPORATION AND BANK TAXES

By Chester B. Pond

Director, Research and Statistics Bureau,
New York State Department of Taxation and Finance

FEDERAL TAXATION

Federal tax laws enacted in July and November applied generally to taxable years beginning after Dec. 31, 1945. With the end of hostilities in Europe came the problem of lightening the wartime tax burden on industry which led to enactment of the Tax Adjustment Act of 1945 (July). This law was devoted entirely to corporation taxation. One of its provisions was the increase of specific exemption for excess profits taxes from $10,000 to $25,000. The increase applies to taxable years beginning after Dec. 31, 1945 and is prorated for fiscal years beginning in 1945 and ending in 1946. This same act also authorized redemption of excess profits tax refund bonds after Jan. 1, 1945.

In November, President Truman signed the Revenue Act of 1945, giving individual and corporate taxpayers a cut of $5,920,000,000 for 1946, the first reduction in 16 years. Like the earlier Tax Adjustment Act, the November law was designed to speed industrial reconversion as well as lighten wartime levies on corporate and individual taxpayers. Corporations were benefited by the repeal of the excess profits tax and a reduction from 40 per cent to 38 per cent for combined normal tax and surtax as well as by a slight reduction in normal tax for incomes over $50,000. The total cut in tax receipts from corporations under the new law is estimated at $3,136,000,000.

STATE CORPORATION TAXES

General.—Several states appointed legislative investigation commissions, which were usually assigned the task of exploring means of encouraging new industries and enterprises. Massachusetts, Rhode Island, and Pennsylvania concluded that they were losing in relative importance as industrial producers and that tax burdens on corporations must be relieved. The Pennsylvania and Massachusetts bodies suggested raising additional funds through sales taxes. A Virginia commission suggested higher revenues through moderate increases in tax rates, including individual and corporation income taxes and gross receipts taxes on public service corporations.

New Jersey.—The New Jersey Commission on Taxation of Intangible Property laid the groundwork for the new franchise tax for domestic and foreign corporations. The tax is in lieu of all other state, county, and local taxation upon or measured by intangible personal property used in business. It is a graduated mill tax on net worth and is allocated according to a formula which includes tangible property, gross receipts, and payrolls within and without the state.

Rhode Island amended the corporate excess profits tax law relating to assessment procedure. The tax is now due June 1, rather than July 1 and the 50¢ per $100 rate is continued through 1946.

North Carolina amended the franchise tax law by adding definitions of "corporation" and "doing business"; by including parent and subsidiary corporations in the provisions specifying inclusion in capital stock of indebtedness used as part of capital; by allowing as a credit any intangibles tax paid on bank deposits; and by providing that new corporations acquiring corporations whose tax has been paid will receive a corresponding credit in determining tax liability for the first year.

Pennsylvania amended its capital stock and franchise taxes by clarifying the provisions for the appraisal and valuation of capital stock of corporations; by including in the gross receipts (formerly gross receipts from sales, fees, and commissions), exclusive of rentals, royalties, interest and dividends allocated under special provisions, and by making special allocation provisions in the case of gross receipts from construction contracts.

Oregon designated the Corporation Commissioner, rather than the Secretary of State, as the recipient of fees and the officer with whom articles of incorporation are to be filed. When a merger agreement is presented, which increases the authorized capital of the surviving corporation, then a filing fee shall be paid. The minimum fee for filing merger agreements where there is no increase in total capitalization is $5.

Maine.—The Legislature provided that the Secretary of State shall certify to the State Tax Assessor the names of new corporations; that the State Tax Assessor shall notify corporations of a change in the amount of franchise tax due; that the State Tax Assessor shall replace the State Treasurer as receiver of the franchise tax and shall institute proceedings when taxes are in arrears for six months; and that the State Tax Assessor instead of the Secretary of State shall prepare a list of corporations which have paid the franchise tax.

Maryland limited to domestic building or homestead associations and credit unions the annual $10 franchise tax heretofore also imposed on all domestic corporations having no capital or stock.

Minnesota provided that, where capital stock is reduced, shares without par value shall be computed at their value at the time of filing the amendment, as shown by a verified statement of assets and liabilities, for the purpose of determining the fee for filing amendments to articles of incorporation.

Idaho added to its corporation tax

law a provision that nonprofit organizations must file a letter of certificate of exemption from Federal income taxes in order to be entitled to exemptions from the license tax

SPECIAL PROVISIONS FOR FOREIGN CORPORATIONS

A few of the states made special provisions for foreign corporations. Iowa provided that foreign corporations having a perpetual permit to transact business in the state must pay a fee of $1.10 for each $1,000 or fraction thereof for any increase of capital in the state. The Michigan Legislature passed a law stating that whenever a foreign corporation admitted to do business in the state increases the proportion of its authorized capital stock represented by property owned or used and business transacted in the state, it shall pay a fee upon each dollar of the increased proportion of its capital stock represented by its property owned or used and business transacted in the state. Florida provided that a domestic corporation which has been dissolved or a foreign corporation whose permit has been cancelled may, by filing reports and paying three years capital stock taxes, have its corporate entity or permit to do business in Florida restored. Florida also permitted corporations to be reinstated at the request of owners of a majority of the capital stock.

STATE BANK TAXATION

Vermont levied a tax on banks measured by net income at the rate of 2 per cent per annum, and repealed the former tax on banks of 4/20 of 1 per cent on the average amount of deposits. State chartered banks shall, and national banks may, file with the Commissioner of Taxes a stipulation binding themselves to pay an income tax at the rate of 4 per cent on all income accruing to residents of the state, as interest or depositors' dividends, upon a deposit in such bank.

New York State amended the Tax Law by providing for the taxation of savings banks under Article 9-B, imposing a 4½ per cent income tax on state banks, trust companies, and financial corporations. Savings banks were formerly taxed under Art. 9, Sec. 189, 0.6 per cent on surplus and undivided earnings. The minimum tax is the larger of $10 or 2 per cent of interest credited to depositors.

Massachusetts changed the date for making bank tax returns from the first ten days of January to March 15. The Commissioner of Corporations and Taxation is no longer required to make an annual report to the General Court on assessed incomes.

Maine provided that returns not under oath shall be made to the State Tax Assessor instead of the Bank Commissioner and that the State Tax Assessor, instead of the State Treasurer, shall notify the banks interested.

COURT DECISIONS

In the Lincoln National Life Insurance Company *v.* Read *et al.*, the United States Supreme Court ruled that the imposition upon a foreign corporation of conditions which are not required of domestic corporations within a state does not contravene the equal protection clause of the Fourteenth Amendment. The decision affirmed a judgment of the Ohio Supreme Court which upheld the validity of a 4 per cent license tax, measured by business done in the state, levied on foreign insurance companies as a condition precedent to securing a license to engage in business for the ensuing year. The court reiterated the long established rule that "a state may discriminate against foreign corporations by admitting them under more onerous conditions than it exacts from domestic companies."

In a Pennsylvania case involving a foreign corporation, the state Supreme Court held that "it is not necessary that the tax imposed upon foreign and domestic corporations be identical to avoid unconstitutional discrimination." The case involved was Commonwealth *v.* Monesseu Amusement Company. The issue was whether a foreign corporation must include in its capital stock for the purpose of computing franchise tax the shares of a domestic corporation which it owns and on which the capital stock tax, a property tax, had been paid. Overruling the Dauphin County Court, the state Supreme Court held that inclusion of such shares does not result in double taxation, since the franchise tax is not a property tax, nor was there held to exist discrimination against foreign corporations because they, unlike domestic corporations, are not granted the exemption which the Capital Stock Tax Act allows for shares held in another corporation.

Tangible personal property of a foreign insurance corporation doing business in Massachusetts may be exempt from the state tax provided a similar exemption is allowed by the state of incorporation to like corporations created by the laws of Massachusetts. The Massachusetts Appellate Tax Board held this to be so in the Great American Insurance Company *v.* Board of Assessors of the City of Boston.

Of interest to manufacturing corporations are two decisions involving *ad valorem* taxation of goods stored in original containers. The U. S. Supreme Court rendered a significant decision exempting from state *ad valorem* taxes fibers imported from foreign countries and from the Philippines and stored by the importer in their original containers for the purposes of future manufacturing. With three justices dissenting and one justice concurring in part, the Court reversed the decision of the Ohio State Supreme Court in Hoover and Allison Co. *v.* Evatt.

In a similar case, Washington Chocolate Co. *v.* King County, certiorari was denied by the U. S. Supreme Court. The Washington State Supreme Court had held in a five-to-four opinion that the Federal Constitution prohibits the state from levying a property tax on cocoa beans which were imported into the state from a foreign country and stored by the importer in their original containers, prior to use in manufacturing chocolate.

The Arkansas Supreme Court ruled in Henry H. Cross Co. *v.* Cook that the Arkansas income tax may be imposed on a post-war refund credit in the Federal excess profits tax. The court declared that such a refund can not be considered as part of the Federal tax so as to be deductible in computing the state tax.

ESTATE AND INHERITANCE TAXES

By Mortimer M. Kassell

Deputy Commissioner and Council, New York State Tax Commission

---

UNITED STATES-UNITED KINGDOM, AND NORTHERN IRELAND DEATH TAX CONVENTION

On April 16, 1945, a Death Tax Convention between the United States and the United Kingdom of Great Britain and Northern Ireland was signed. This treaty is based on the principles underlying the United States-Canadian Death Tax Convention of June 8, 1944 and is designed to avoid double taxation and prevent fiscal evasion with respect to Federal estate taxes and British estate duties. The Convention was favorably reported by the Senate Foreign Relations Committee on July 3, 1945 and was assented to by the British Parliament. It will become effective upon exchange of instruments of ratification.

Significant developments in the field of reciprocal death taxation included an agreement reached by the Canadian provinces of Quebec and Ontario, based on the principles underlying the United States-Canadian Death Tax Convention, and enactment by six more states of provisions for the reciprocal exemption from death taxes of the intangible personal property of non-resident decedents.

STATE LEGISLATION

Arkansas.—Many important legislative changes were made in state death tax laws. Arkansas amended its estate tax law to provide for the imposition of a tax equal to the credit for state death taxes allowable against the basic Federal estate tax, and provided for the reciprocal exemption of intangibles of non-residents (Act 294).

California provided that the renunciation or waiver of an interest in the estate of a decedent, or an agreement for the distribution of such interest, shall not affect the computation of its inheritance tax, and provided for the exclusion from the estate of jointly owned property proved to have been owned originally by the surviving joint tenant (Ch. 1014).

Connecticut made provision for the apportionment of Federal and state estate taxes (Ch. 228).

Delaware shortened the period for transfers presumed to have been made in contemplation of death from two years to six months (H.B. 269), and amended its law in relation to the classification of beneficiaries, previously taxed property, and jointly owned property (H.B. 143).

Illinois provided for the reciprocal exemption of transfers to non-resident charities (S.B. 183), and for the payment of a tentative tax on contingent remainders (S.B. 415).

Indiana exempted from its inheritance tax the first $25,000 of the estate of members of the armed forces who died, not later than one year after the termination of the Second World War, of injuries received or diseases contracted in such war (Ch. 103).

Maine provided for the apportionment and proration of estate taxes (H.B. 422).

Maryland provided for the exemption from transfer tax of registered bonds of the United States in the name of a husband and wife passing to the surviving spouse (Ch. 742), enacted the uniform act on interstate arbitration of domiciliary disputes (Ch. 982) and the uniform act on interstate compromise of death taxes where there is a domiciliary dispute (Ch. 983).

Montana provided for the reciprocal exemption of intangibles of non-resident decedents (H.B. 22).

Nebraska provided for the reciprocal exemption of intangibles of non-resident decedents (Bill 201).

New Jersey provided for the compromise of inheritance taxes where there was reasonable doubt as to collectibility (Ch. 127).

New Mexico enacted an additional estate tax to absorb the credit for state death taxes allowed against the basic Federal estate tax (Ch. 66).

Oklahoma provided for the reciprocal exemption of intangibles of non-resident decedents (H.B. 419).

Pennsylvania provided for the compromise of claims and suits for the collection of inheritance taxes (Act 216).

South Dakota provided for the reciprocal exemption of intangibles of non-resident decedents (S.B. 59) and amended its law relating to transfers in contemplation of death (H.B. 160; S.B. 249).

Texas provided for the reciprocal exemption of intangibles of non-resident decedents (H.B. 175).

Vermont exempted transfers to foreign charitable organizations (S.B. 51).

Washington expanded the provisions relating to transfers intended to take effect at death (Ch. 184).

Wisconsin exempted transfers to any national organization of veterans of the armed forces of the United States or a subordinate unit (Ch. 622).

FEDERAL TAXATION

In Fidelity-Philadelphia Trust Co. *v.* Rothensies (324 U. S. 108), the United States Supreme Court held that the full value of a transfer in trust was includable in the gross estate of the grantor, for Federal estate tax purposes, as a transfer intended to take effect in possession or enjoyment at his death, where the trust agreement provided that, if the grantor survived the remaindermen, the remainder was to go as he appointed by will.

In Commissioner of Internal Revenue *v.* Estate of Field (324 U. S. 113), the Supreme Court held that the full value of the trust principal, at the date of the grantor's death, is includable in the gross estate, where the grantor had retained a reversionary interest.

In Goldstone *v.* United States (89 Law. ed. Advance Opinions 1253), the Supreme Court held that the total amount payable under an annuity contract and life insurance policy purchased by the decedent is includable in his gross estate, as a transfer intended to take effect in possession or enjoyment at his death, where the beneficiary of the policy had legal incidents of ownership but such incidents were to vest in the decedent if he survived the beneficiary.

In Fernandez *v.* Wiener, decided on Dec. 10, 1945, the Supreme Court sustained the constitutionality of the provisions of section 811(e) of the Internal Revenue Code, added by the Revenue Act of 1942, under which the Commissioner of Internal Revenue had included in the gross estate the entire value of property held as community property by the decedent and his wife under the laws of Louisiana.

In United States *v.* Rompel, decided by the Supreme Court on the same day, the Court reached a similar conclusion with respect to property held as community property under the laws of Texas.

In City Bank Farmers Trust Co. *v.* McGowan (323 U. S. 594), the Supreme Court held that, under the facts in such case, certain transfers directed to be made by order of a court out of property of an incompetent were transfers in contemplation of death made by such incompetent.

In Rosenman *v.* United States (323 U. S. 658), the Supreme Court held that payment of an estate tax before assessment is not such payment as sets the statute of limitations running against a claim for refund.

AUTOMOBILE TAXES

By Alma S. Russell
New York State Department of Taxation and Finance

WAR-PEACE TRANSITION FACTORS

With more liberal gasoline rations, motor fuel tax receipts for 1945 showed a substantial increase over those for 1944. Receipts in 31 states for the first four months of 1945 exceeded by $4,500,000 the 1944 collections for the same period. Federal petroleum taxes for the first four months in 1945 doubled those of 1944. With the end of gasoline rationing and the resumption of new car production, the entire automobile tax picture will be greatly changed.

In spite of agitation by individuals and organizations, the Federal automobile tax was again levied in July 1945, and each car owner was required to purchase a five dollar stamp. Efforts to abandon the automobile use tax, considered by many as unfair and unmanageable, are being continued. The war emergency excise taxes on motor vehicle fuels will remain until six months after the official end of the war.

CAR REGISTRATION LEGISLATION

With 46 of the 48 state legislatures meeting for either regular or special sessions, a great deal of new legislation was passed concerning automobiles. So many changes were made that only a few of the outstanding ones may be mentioned.

Perhaps one of the most interesting was a Wisconsin law which adopted a permanent system of car registration designed to eliminate some of the problems of the annual registration. The bill, originated by Acting Commissioner of Motor Vehicles, B. L.

Marcus, provides for 12 registration periods, each of which will start on the first day of the month and end on the last day of the twelfth month following. The first figure on the permanent license plate will denote the period for which issued, 1 denoting January, 2, February, and so on. Following this, will be a metal tab inserted annually to indicate the year for which the license is valid. Registration plates will be transferable from one car to another for the same owner but not from person to person. New registration lists will be issued every five years.

Maryland also passed a law providing that the Department of Motor Vehicles might, with the approval of the Governor, adopt a permanent registration system and design and adopt permanent registration plates in such form as to make the system effective.

Idaho provided that applicants for registration of motor vehicles must list, in addition to information previously required, the type of fuel used by the vehicle to be registered. Indiana created an entirely new law for the registration and licensing of motor vehicles. Included in this was provision for a new bureau to be known as the Bureau of Motor Vehicles.

Arkansas changed the registration period from Nov. 1-Dec. 31 to Jan. 1-Jan. 31. Oklahoma increased registration fees and reapportioned receipts.

Missouri and North Dakota made special provisions for the registration of vehicles. Missouri exempted from the Motor Carrier Act motor vehicles used in transporting farm machinery, produce, supplies, household goods, or other articles or commodities from farm to farm. North Dakota exempted from motor carrier taxes and regulations, vehicles used in the emergency transportation of perishable farm produce.

MOTOR RECIPROCITY

Reciprocity provisions were passed by several of the states. Maine reenacted until Dec. 31, 1947 sections of the law relating to reciprocity for non-resident vehicles and operators. In Minnesota, application for reciprocity was denied to truck-tractors, semi-trailers, trailers and combinations of such vehicles engaged in transporting property for hire. Maine broadened its provision relating to reciprocity in collecting excise taxes on motor trucks and trailers.

New Hampshire allowed the privilege of using the highways of the state without a license from the Commissioner, to a motor vehicle of a non-resident whose operator or chauffeur is licensed and has complied with the law respecting motor vehicle registration in the state or country in which the vehicle is registered. New Hampshire also provided that the highways of the state may be used by foreign motor vehicles registered in their home states or countries to the same degree as the home state or country allows like privileges to New Hampshire vehicles.

Maryland created a Reciprocity Commission composed of the Governor, Secretary of State, Chairman of the Public Service Commission, Superintendent of the State Policy Department, and Chairman of the Highway Commission. It is the duty of the Commission to confer with officials of other states for the purpose of establishing reciprocity arrangements and planning for the movement of motor vehicles between various states.

FINANCIAL RESPONSIBILITY

Maryland joined the states which require proof of financial responsibility by owners and operators of motor vehicles. The enforcement of this law in Maryland was placed under the jurisdiction of the State Police Department. The act, which requires proof of financial responsibility within 60 days after an accident, contains provisions relating to revocation of licenses and permits.

REGISTRATION AND TAX EXEMPTIONS

Two states exempted United States Government-owned and -operated vehicles from registration. In Oregon, an amendment to a 1941 statute included trailers and the exemption as to registration and license of government-owned and -operated motor vehicles. New Hampshire authorized the Commissioner of Motor Vehicles to prescribe special rules and regulations relative to registration of motor vehicles owned and operated by the Government of the United States, the state, or by any county, city, or town. The Commissioner may now issue permanent number plates for such vehicles and they will be considered to be properly registered and may be operated upon the highways of the state without further registration.

Wyoming, Ohio, and Maryland provided for tax exemption of motor fuel sold to the United States. Wyoming exempted from tax sales involving a single delivery exceeding 300 gallons to the United States. Ohio, in extending its excise tax on liquid fuel from March 31, 1945 to March 31, 1947, provided that no tax shall be imposed upon sales thereof, to the United States Government "except as may be permitted by it." Maryland authorized the Comptroller to promulgate regulations allowing the noninclusion of the tax in the price of gasoline sold by licensed dealers to the United States. South Dakota, on the other hand, amended the 1941 chapter of its laws by deleting the provision exempting from the excise tax, motor fuel used by the United States or its instrumentalities.

MOTOR FUEL TAXATION

Some changes were made in taxation of special kinds of fuel. A special excise tax of four cents on every gallon of aviation gasoline and aviation gasoline substitutes sold in Minnesota, was imposed. Refunds, as follows, were provided for taxes paid on aviation gasoline over and above 50,000 gallons received, stored, or withdrawn from storage and not sold or otherwise disposed of for others or intended for sale or other disposition to others:

50,000 to 100,000 gallons	1¢ per gallon
100,000 to 150,000 gallons	2¢ per gallon
150,000 to 200,000 gallons	3¢ per gallon
200,000 gallons and over	3½¢ per gallon

A few states made changes in gasoline tax rates. Of those that did, Oklahoma made the greatest increase, levying a temporary additional tax of two cents a gallon on gasoline, to be reported and collected as other taxes on gasoline are administered, and to expire Dec. 31, 1946. New York State extended for another year its two emergency taxes, each for one cent per gallon on gasoline and motor fuel. To match Federal aid to highway funds, Kansas imposed an additional tax of one cent per gallon on use, sale, or delivery of motor fuels when used to propel motor vehicles upon the highways of the state. The revenue from the tax is to be used to pay the principal and interest of warrants issued to obtain funds to match Federal highway aid funds for road construction.

Iowa increased its tax on liquified gas from three cents to four cents a gallon. Idaho raised its tax on motor fuel from five cents to six cents a gallon, for a period ending March 1, 1947. The law provided that one cent of the tax be placed in the highway fund and be used for matching Federal aid funds for highway construction and improvement.

SPECIAL JUNIOR LICENSES

Several changes were made in special junior licenses. New York State extended for another year the provision authorizing the holder of a junior operator's license to operate any registered motor vehicle for agricultural or dairy purposes with or without compensation, upon the public highways. Missouri extended to June 1, 1947, provisions authorizing the issuance of special chauffeur certificates to persons 16 and 17 years of age for the principal purpose of operating motor vehicles used for the transportation of farm products and supplies to or from market and for local delivery service. West Virginia increased the fee for an operator's license from 75¢ to one dollar for a four-year period. Oklahoma increased the fee for chauffeur's license, at the same time increasing the period from one to two years. Delaware inaugurated the issuance of a permanent operator's or chauffeur's license to such persons 21 years of age or over who have been licensed as an operator or chauffeur for three consecutive years. The fee is $5.00. Vermont, Michigan, and Maryland made changes in their laws governing revocation and suspension of licenses.

PUBLIC RESOURCES AND UTILITIES

FEDERAL SURVEYS AND MAPS

By K. T. Adams
Commander, U. S. N.; Chief, Division of Photogrammetry,
U. S. Coast and Geodetic Survey

GENERAL

During the first half of 1945, all Federal mapping and surveying agencies devoted most of their efforts to mapping foreign areas for the Armed Forces. With the termination of the war, these agencies made plans to return to their normal peacetime activities. The global nature of the war has made the average individual more map conscious than ever before. This increased familiarity has caused the public to realize that maps, charts, and air photographs are just as indispensable for intelligent planning in peace as in war. The truth of this statement is verified by the increased requests for maps and charts from numerous national, state, and local governments. Many wartime security restrictions concerning the distribution of maps and aerial photographs have been removed.

SURVEYING AND MAPPING SOCIETIES

The American Congress on Surveying and Mapping was organized in 1941, and had its last annual meeting in June, 1945. The Congress is a non-profit organization dedicated to the advancement of surveying and mapping in the Western Hemisphere by promoting the use of maps and encouraging all basic mapping programs. Its official journal is *Surveying and Mapping* which is published quarterly for distribution to members of the Congress. It is the only publication in this country that covers the entire surveying and mapping field.

The American Society of Photogrammetry was organized in 1934. It is a non-profit organization dedicated to the advancement of photogrammetry, and to act as a clearing house for the distribution of information pertaining to the science. Its annual meeting is held in Washington, D. C. in January of each year. The Society publishes periodicals and books dealing with the use of air and ground photographs for surveying and mapping purposes. Its official journal *Photogrammetric Engineering* is published quarterly. The Society published in December, 1944 a *Manual of Photogrammetry* which is used both as a text and reference book in the field.

SURVEYING AND MAPPING AGENCIES

Federal mapping agencies may be classified as follows: (1) agencies whose chief functions are field surveying and map compiling, the results of which are used by other agencies and for the general benefit of the nation; (2) agencies which survey and compile specific maps needed by them to carry out their functions properly; (3) agencies which meet their special mapping needs by compiling maps from existing data without making any field surveys.

The Geological Survey makes field surveys and publishes geologic maps, primarily for its own use, and topographic quadrangle maps which are generally used by all agencies and the public and form part of the standard map of the country. The Coast and Geodetic Survey establishes the basic horizontal and vertical control throughout the country and its possessions, surveys the coasts and adjoining waters and publishes nautical charts of them, and compiles and publishes aeronautical charts. The Corps of Engineers makes field surveys and publishes tactical and other maps primarily for Army use. The Hydrographic Office makes coastal and hydrographic surveys in some foreign areas and compiles and publishes nautical charts of all foreign waters. The General Land Office surveys and sub-divides the public lands. The Soil Survey makes field surveys and publishes soil maps and bulletins connected with land use. The Forest Service makes field surveys and publishes maps of national forests, primarily for its own administrative use. The Division of Geography and Cartography of the Department of State, the International Boundary Commissions, and the Division of Maps of the Library of Congress, all occasionally compile maps for special purposes.

A Map Information Office is maintained in the Geological Survey, which serves as a central clearing house to furnish to the various government agencies and to the public, information relative to surveys, existing maps, and air photographs.

The Bureau of the Budget coordinates the activities of all Federal surveying and mapping activities, thus eliminating unnecessary duplication of effort and creating an over-all efficiency of operations. The Bureau acts as a clearing house for the dissemination of knowledge of new methods and instruments, and encourages the adoption of the most efficient and economic methods.

The mapping accomplishments during 1945 are reported under the various department and agency headings.

WAR DEPARTMENT

The Corps of Engineers is responsible for all maps and surveys needed by the War Department, excluding the Army Air Forces. Maps for the military forces are normally produced in the United States by the Army Map Service, and overseas by the topographic troops of the Corps of Engineers. Since certain details of the mapping activities of the War Department have been omitted from THE AMERICAN YEAR BOOK for the war years, this report concerns the mapping activities during the war rather than being restricted to the year 1945. The huge demand for maps by fighting forces during the period of hostilities was met by close cooperation among all map-producing agencies. In the European theater, mapping efforts were closely coordinated with those of our allies. There was no area in which American or Allied troops engaged with the enemy, or anticipated engagements with the enemy, that was not covered by maps prepared from aerial photographs or from the best basic material available.

The Army Map Service programmed all foreign maps needed for military operations. About 30,000 new and revised maps were produced, including 25,329 by the Army Map Service itself, 1,544 by other government agencies, and 3,127 by commercial contactors. The total map production of 450,000,000 copies was so large that about two-thirds of all the reproduction work was done by commercial lithographic firms. In addition to producing maps, the Army Map Service supplied field topographic units with control data and other source material, as well as technical bulletins on new and improved map compilation techniques. The War Department Map Library, which is maintained at the Army Map Service, increased from an insignificant quantity of maps in 1941 to what is probably one of the largest map collections in the world in 1945.

The Aeronautical Chart Service of the Army Air Forces is responsible for the production, acquisition and supply of all maps, charts and related publications used by the Army Air Forces.

Through its own facilities and through the facilities of other Federal agencies and commercial companies, 6,123 charts and related publications were maintained. More than 46,000,000 copies of charts and related publications were printed and supplied to Army Air Forces activities throughout the world. The chart series involved in the above maintenance and supply are: Target charts at various scales, approach charts at scale 1:250,000, pilotage charts at scales 1:500,000 and 1:1,000,000, flight charts at scale 1:1,000,000, radar charts at scale 1:1,000,000, long range air navigation charts at scale 1:3,000,000, planning charts at scale 1:5,000,000, and Loran and other special charts at various scales.

Trimetrogon photographs of 3,312,000 square miles of area were taken during the last year, bringing the total coverage to approximately 14,396,000 square miles. These are compiled at comparatively small scales to furnish topographic information for aeronautical charts. Through the facilities of the Aeronautical Chart Service and those of the Geological Survey, more than 3,721,000 square miles of planimetry were compiled during the year, bringing the total to 11,253,000 square miles. The Army Air Forces determined 598 new astronomic positions for use in photogrammetric compilation, and in addition 565 previously established astronomic positions were recovered and identified.

The civil mapping activities of the Corps of Engineers, the Lake Survey, and the Mississippi River Commission (see THE AMERICAN YEAR BOOK, 1941, p. 249) were held to a minimum because of the urgent military mapping requirements.

HYDROGRAPHIC OFFICE OF THE NAVY DEPARTMENT

The Hydrographic Office provides world-wide coverage of foreign nautical and aeronautical charts and allied publications for the use of mariners and aviators. The information for these charts and publications originates from the leading maritime nations of the world, from Navy hydrographic and aerial photographic surveys, from reports submitted by Navy and merchant ships, from consular agents of the State Department located in the scattered ports of the world, and from numerous other sources.

During 1945 the Hydrographic Office continued the vital work of furnishing charts to naval and merchant vessels and air services for their worldwide operations. In peacetime the Navy makes hydrographic and aerial photographic surveys of foreign countries, principally in Central and South America. During the recent war this work was greatly increased, particularly in combat areas where surveys are essential to the successful prosecution of the war. Compiled in 1945 were over 650 special approach and bombardment charts, and hundreds of air approach, target and loran charts (loran charts are used for radar navigation). The majority of the special charts mentioned were prepared for amphibious and air operations in the Pacific theater of war.

Hydrographic survey operations were carried out in strategic areas following landing operations, and in some instances prior to amphibious assaults. These fleet survey vessels were equipped with cameras, presses, and other reproduction facilities in order to expedite the printing and delivery of the resulting charts in a minimum of time.

To provide the Navy with nautical and aeronautical charts and allied publications necessary for war operations, the Hydrographic office has on issue 5,200 nautical and 450 aeronautical charts of the world, besides hundreds of other special charts which in 1945 involved the printing of nearly 33,000,000 copies. These charts are constantly being revised and reprinted as later and better information becomes available.

DEPARTMENT OF THE INTERIOR

The Geological Survey makes field and photogrammetric surveys, and publishes geologic and topographic maps. The latter are part of the standard topographic map of the United States and are for sale as quadrangle sheets. About half of these are published as 15-minute quadrangles on the 1:62,500 scale with most of the remainder being published as 7.5-minute quadrangles on either 1:31,680, or 1:24,000 scale. The topographic maps also are the bases for the geologic maps which are included in the geologic reports. Maps published during the year included 241 new topographic quadrangles, 401 reprints of old topographic maps, 12 special maps, and 44 preliminary geologic maps.

New topographic surveys covering 8,576 square miles were completed in 23 states, and 5,406 square miles of resurveys were completed in 18 states. The largest areas of new topographic mapping were located in Missouri, Louisiana, California, Illinois, and Maine. Planimetric maps of 1,638 square miles in Wisconsin were compiled from air photographs for publication prior to the addition of contours.

All planimetric maps were office-compiled by photogrammetric instruments, principally multiplex. Photogrammetric methods were also used for the compilation of original map manuscripts of a considerable part of the topographic maps.

Control surveys for this mapping consisted of 301 occupied triangulation stations, 1,479 linear miles of transit traverse, and 2,634 linear miles of leveling, all of third-order accuracy or higher. Results of horizontal and vertical control surveys for various quadrangle maps were issued in lithographic lists.

Air photographs covering 48,800 square miles were procured, or contracted for during the year for use in mapping.

New topographic maps of foreign areas, totaling 35,700 square miles, were compiled from air photographs for the War Department.

Progress continued on the Millionth Scale Map of the World. Compilation and drafting were carried forward on sheets of H-14, Austin; H-15. Mississippi Delta; I-17, Savannah; I-18, Hatteras; K-10, Mt. Shasta; K-17, Lake Erie; and L-10, Cascade Ranges.

Work progressed on the Transportation Map of the United States, scale 1:250,000, being prepared for the Public Roads Administration. Forty-one sheets were in the course of publication, while 14 sheets were published.

The Alaska Branch of the Geological Survey, in connection with the worldwide charting program of the U. S. Army Air Forces, compiled new terrain data from aerial photographs covering more than 2,000,000 square miles for a total to date of approximately 7,500,000 square miles. For the greater part, this involved only planimetric mapping, but 500- or 1,000-foot contours were added to 620,000 square miles of the more mountainous regions, where such data were lacking and where terrain clearance information was vitally needed for safe air navigation. The drafting of 132 charts of various types, for photolithographic reproduction, was also completed in connection with this program.

The Board on Geographical Names made a total of 7,067 decisions, of which 63 were on domestic names. Incidental to checking the names on map series of the Corps of Engineers, and editing manuscripts and maps of strategic studies for the armed forces, over 85,000 individual names were processed according to the policies of the Board. All names were checked against official sources, and all variant forms of each name were cross-referenced. Eleven gazetteers were compiled to accompany strategic studies. Directions for the treatment of geographical names were prepared for 19 areas in the Orient, and for five areas in Europe. Guides to Geographical Names were written for central Asia and Korea.

The General Land Office, Office of Indian Affairs, National Park Service, and Fish and Wildlife Service continued their activities as previously described in THE AMERICAN YEAR BOOK, 1941 (p. 250).

DEPARTMENT OF AGRICULTURE

The Department acquired from 1926 to date, air photographs covering 2,944,661 square miles of area, of which about one-fourth is duplicate coverage, necessitated by obsolescence, cultural changes, flood damages, shifting of crop boundary outlines, etc. Owing to the requirements of the War and Navy Departments for trained air photographers and pilots, the Department's air photographic program has been greatly curtailed and only a comparatively small area was photographed during the year. Practically all the photographs are at a scale of approximately 1:20,000 and most of them are suitable for use in mapping.

The Field Service Branch (formerly the Agricultural Adjustment Agency) of the Production and Marketing Administration continued its air photographic activities as described in The American Year Book, 1944 (p. 289). Special projects for the War and Navy Departments included the preparation of photographic mosaics of several areas in Japan.

The Division of Soil Survey, Bureau of Plant Industry, Soils, and Agricultural Engineering issued during the year five detailed soil maps together with accompanying explanatory bulletins, bringing the total of such published surveys to 1,540. The new maps and reports were for the following areas: Macon County, Alabama, Tishomingo County, Mississippi, Big Horn Valley, Montana, Huntington County, Pennsylvania, and Kittitas County, Washington. Forty-one additional maps are being printed. Although field surveys by the Division were discontinued during the war, cooperating state agencies made field surveys during the year on approximately 1,000,000 acres, the results of which will be published on maps in the regular soil-map series. Special soil maps, from field surveys or compiled from existing data, were prepared in connection with the war-expanded production of crops.

The Forest Service during the past year, compiled and revised by photogrammetric methods, maps of Pacific areas assigned to it by the Navy Hydrographic Office. Practically all mapping personnel was engaged on work for the military agencies. No new mapping of forest areas was undertaken.

The Soil Conservation Service used its cartographic facilities in 1945 chiefly in preparing maps and charts for the War and Navy departments. In addition, field work for controlling soil-conservation surveys, was completed in Dakota County, Minnesota, Wibaux County, Montana, and Oneida County, Idaho. Several quadrangles, showing land capabilities, were published for Muskingum and Guernsey counties, Ohio. For the first time since 1941 the Soil Conservation Service awarded contracts for aerial photography totaling 55,000 square miles in 10 states.

DEPARTMENT OF COMMERCE

The Coast and Geodetic Survey in 1945 published 10 new nautical charts. In addition, 79 new editions, 716 new prints, and 516 reprints of existing charts were published. The total number of catalogued nautical charts, which are under constant revision and of which revised editions are frequently published, is 873, of which 163 are of Philippine waters. The latter group of charts was the only adequate one available to the armed forces for amphibious operations in the Philippines in 1945.

Hydrographic surveys were made covering 2,576 square miles, in which were 22,310 miles of soundings, mostly in the waters of Maine, Chesapeake Bay, and Alaska. Topographic surveys, using air photographs, were made of 911 square miles, in which there were 1,739 miles of shoreline, mostly in Maine, Maryland, Virginia, and Florida.

Control surveys were made as follows: First-order triangulation, 1,847 linear miles, covering 30,455 square miles of area; second-order triangulation, 930 linear miles, covering 11,239 square miles of area; second-order traverse, 61 miles; first-order levels 2,547 miles; second-order levels, 1,671 miles; 11 first-order bases measured totaling 52 miles; and 16 astronomic stations occupied. Reconnaissance for future triangulation extended along 3,117 miles of arc covering 40,320 square miles of area. During the year, 1,883 triangulation stations were located, and the elevations of 6,124 bench marks were determined in the United States and Alaska. A notable achievement in control surveys made during the year was the extension of the North American datum of 1927 to include the Aleutian Island group, thus bringing all triangulation in Alaska and the United States to a common datum.

The standard aeronautical charts of the United States and possessions, 134 in number, were maintained as to aeronautical data. Field surveys on 205 airports were completed. The production of 447 instrument approach and landing charts based on these and previous surveys was in process. This series of airport charts, of which 371 have been printed, is increasing in importance (see The American Year Book, 1940, p. 289, and 1941, p. 251).

Air photographs of 10,000 square miles, covering scattered areas along the Atlantic and Gulf coasts, were taken in collaboration with the U. S. Coast Guard. These photographs were used for nautical chart corrections and for the compilation of 86 planimetric maps. The total number of planimetric maps published to date is 804, with 254 awaiting publication. These maps were described in The American Year Book, 1940 (p. 289). The topographic mapping of strategic areas for the War Department was completed by the publication of the remaining 135 quadrangles (see The American Year Book, 1944, p. 290).

The Weather Bureau, Bureau of the Census, and Bureau of Foreign and Domestic Commerce compile and publish special-type maps (see The American Year Book, 1943, p. 296).

FEDERAL WORKS AGENCY

The Public Roads Administration, in cooperation with the State Highway departments, is conducting highway planning surveys throughout the country which will eventually provide a complete series of state and county maps showing the location of approximately 3,000,000 miles of rural roads and the character of culture served by them. The resulting state, county, and transportation maps have been described in previous editions of The American Year Book (1939, p. 276; 1940, p. 290; and 1941, p. 252). Only additions to these series are reported here (for those previously available, see The American Year Book, 1944, page 291, and prior issues).

County maps for one additional county were issued in 1945, and maps for 65 of the remaining 73 counties are in progress.

No new transportation maps were published in 1945 but 46 sheets in six states have been revised.

TENNESSEE VALLEY AUTHORITY

Owing to urgent military map requirements, the domestic mapping activities of the Tennessee Valley Authority during 1945 were held to the very minimum. The work was limited to the extension of ground control for future mapping activities in the Tennessee Valley. The status of completed mapping in the Valley is the same as previously reported (see The American Year Book, 1944, p. 291).

Final compilation and printing of maps requested by the War Department, covering areas of strategic importance in New York, Texas, and South Carolina, has progressed to the point where over half of the total number of quadrangle sheets have been published (see also The American Year Book, 1943, p. 297, and 1944, p. 291).

During the year the Authority's mapping efforts were directed principally toward the preparation of strategic and tactical maps of foreign areas for the War Department. The total mapping assignments in the European and Asiatic theaters have amounted to approximately 500,000 square miles. The types of mapping included were new stereo-photogrammetric compilations, and revisions based on aerial photographs. The publication scales were 1:25,000, 1:50,-

000, and 1:100,000. Countries included in this mapping program were France, Germany, Austria, Yugoslavia, Holland, Poland, Czechoslovakia, and Hungary, also Formosa and the main Japanese Islands. Emphasis has been shifted to occupational mapping needs since the termination of hostilities.

The property surveys, cadastral maps, and navigation charts made by the Authority were described in THE AMERICAN YEAR BOOK, 1943 (p. 297).

STATE GEOLOGICAL SURVEYS

BY WILSON M. LAIRD
STATE GEOLOGIST, NORTH DAKOTA

GENERAL

In most states the State Geological Survey or its equivalent bureau, usually called a State Bureau of Mines, has been long established. As a result of this long continuity of endeavor most state surveys have built up a considerable fund of information that is naturally most useful to the inhabitants of that particular state or persons interested in the resources of that state.

During the years of the depression, many state surveys were curtailed drastically or went out of business altogether. In many of the latter cases the departments of geology at the state universities carried on their work as best they could. At the present time most state surveys are operating on budgets which are, for the most part, considerably larger than they have had for some time.

These increased appropriations are naturally the result of better times in all the states. With the increased revenues the state legislatures have realized that the time is now here to take adequate stock of their natural resources and have turned to the agency in their state most likely to have the information—the State Geological Survey.

Along with the increased appropriations has gone the corollary of increased prices for equipment the surveys must purchase as well as long-deserved-but-not-granted pay increases to Survey personnel. With greater resources to pay salaries the surveys can hold their more competent men and attract other competent help which was formerly almost impossible. This has naturally helped the tenor of the scientific work done by the State Surveys.

REPORTS AND OTHER PUBLICATIONS

Most of the state surveys issue reports in the forms of bulletins, reports of investigations, and other similar types of issues. Some of these reports are printed directly by the survey concerned while others are written by members of the survey and published in national scientific journals. In these latter cases the material which is printed as separates may be either directly purchased by the survey or reprinted in a form approved by the publication in which it was originally printed and the survey concerned. In this way material of interest to the states is brought out in a form which is considerably cheaper than direct printing. Some surveys issue these in the form of reprint series while others issue them as bulletins. In as much as printing costs have risen considerably since the war the surveys are interested in saving any money possible on publication costs.

Several of the surveys have been successful in issuing small lithoprinted and mimeographed periodicals which come out about once a month. These are printed with the idea of keeping the people of their constituency informed of progress in the mineral field. In these periodicals appear articles written by members of the State Surveys or by men in the mineral extractive fields themselves for the general reading public. They are written in a simple yet technically accurate style which will appeal to the lay reader.

Several of the State Surveys have been successful in helping promote Mineral Industry Conferences which bring together the men in the mineral extractive and processing industries and the scientific men of the state. Thus the men of the industry meet the men of the Survey and the exchange of ideas is mutually helpful. These conferences also stimulate interest in the work of the State Survey which can assist the state bureau when the legislature of that state considers the budget of the Survey.

FEDERAL-STATE COOPERATION

At the present time there is a great deal of cooperation with agencies of the Federal government on the part of the State Surveys. Particularly is this true in the Missouri Basin states where there is at present a big investigative program in connection with the proposed development of that Basin. The representatives of the Federal Government naturally come to the State Surveys and ask for assistance in compiling information on the mineral resources of the region. A great deal of interest has been developed in connection with the large proposed construction projects, particularly dams and construction materials, especially sand and gravel. In some cases it has been found that this information has been sadly neglected by all governmental agencies both state and Federal. This is a field which it is hoped will be worked on more intensely by all agencies concerned in construction.

During the war and continuing on an increased basis, the State Surveys have cooperated with the United States Geological Survey in many types of endeavor. The main fields in which the states cooperate with the Federal Survey are geologic work, stream gaging, ground-water investigations, and topographic mapping. Many of the states have been cooperating for years with this government agency while others have come into cooperation only recently.

This cooperation is usually on a 50-50 financial basis although it is not always so. In some states, the cooperating parties each assigned a man to work on a certain project under a form of informal collaboration. In most cooperations either party has been free to publish the results of the cooperative work. In some cases, the Federal Government, having greater resources, prints the final report.

The ground water work of the State Surveys is increasing tremendously as the citizens of the states realize more and more the importance of this little-noticed natural resource. Many of the states, through their State Geological Survey or other state agency, are cooperating with the United States Geological Survey in this work while others are doing all their own work without any Federal cooperation. Undoubtedly, this type of work will continue to increase, especially in the arid and semi-arid states of the West and Midwest, as well as in the more humid parts of the country, particularly near large industrial areas securing their water in whole or in part from underground supplies. At the present time there is great interest in the ground water resources of the states in the Missouri Basin in view of the tremendous changes which will take place there in ground water levels after the water is impounded behind some of the large proposed dams.

ALABAMA

Organization.—Geological Survey of Alabama, University, Dr. Walter B. Jones, State Geologist.

Basic and Economic Geology.—*Projects:* Oil and gas well logs; Coosa Coal field; Red iron ore of northeastern Alabama; Shales of Alabama. *Publications:* Well Logs of Alabama 1940-45 (*Bull. 27*); Shales and Fire Clays of Alabama (*Bull.* 55).

Water Resources.—*Projects:* Natural water losses of Alabama; Ground water of south Alabama. *Publications:* Ground water of the Cretaceous areas of Alabama (Spec. Rept. 18); Water losses from selected drainage basins in Alabama (*Bull. 56*).

Others.—*Publication:* Beetles of Alabama (Mon. 11).

ARIZONA

Organization.—Arizona Bureau of Mines, Tucson, Dr. T. G. Chapman, Director.

Basic and Economic Geology.—*Projects:* Geologic examination of mineral deposits; Compilation of map showing location of wells drilled for oil in Arizona; Coal for sponge iron manufacture; Relation of struction to ore deposits in central and western Arizona; Iron for sponge iron; Perlite deposits in Arizona.

Others.—*Projects:* Compilation of mineral production statistics for Arizona by state, counties and districts; History of mining in Yavapai Co.; History of the Vere (Jerome) district.

ARKANSAS

Organization.—Division of Geology, Little Rock, Harold B. Foxhall, Director.

Basic and Economic Geology.—*Projects:* Rock wool; Lignite resources of Arkansas; Barite deposits of Montgomery and Polk Counties.

Water Resources. — *Projects:* Ground water resources in the vicinity of El Dorado; Collection of basic data in 1945 surface water supply report.

Topographic and Planimetric Mapping.—*Projects:* Malvern quadrangle. *Publications:* Almond, Cave City, Jamestown, Mt. Pleasant, Olmstead, Salado, Sandtown, Sulphur Rock, Woodwon quadrangles.

CALIFORNIA

Organization.—Division of Mines, Dept. of Natural Resources, San Francisco, Walter W. Bradley, State Mineralogist.

Basic and Economic Geology.—*Projects:* Geology of the San Juan Bautista quadrangle; Iron resources of California; Quicksilver in San Benito and Fresno counties; Quicksilver in Knowville district; Limestone in California. *Publications:* California Journal of Mines and Geology for April, July, and October 1944.

Others.—*Projects:* Minerals of California; Miners and mineral resources of Riverside, Kern, Lake and San Benito counties. *Publications:* Statistics (*Bull. 128*); Economic mineral resources (*Bull. 130*).

CONNECTICUT

Organization. — State Geological and Natural History Survey, Hartford, Dr. E. L. Troxell, Superintendent.

Basic and Economic Geology.—*Projects:* Mapping garnet formations; mapping quartz formation; mapping loess deposits; Kaolin investigations; Tree census. *Publication:* Mosquitoes (Bull. in press).

FLORIDA

Organization.—Florida Geological Survey, Tallahassee, Dr. Herman Gunter, Director.

Basic and Economic Geology.—*Projects:* Micropaleontology; Geology and structure of Florida; Investigations and studies in stratigraphy and structure; Investigations of peat deposits with special reference to fuel value and uses in plastics. *Publications:* Florida geology and petroleum; Stratigraphic and paleontologic studies of wells in Florida, No. 4 (*Bull. 28L*); Geology of Florida with geologic map (*Bull. 29*).

Water Resources. — *Projects:* Ground water studies; Surface water, especially springs and lakes; Quality of water. *Publications:* Salt water encroachment in southern Florida.

GEORGIA

Organization. — Department of Mines, Mining and Geology, Atlanta, Garland Peyton, Director.

Basic and Economic Geology.—*Projects:* Regional and structural geology of Fort and Cohutta mountain areas as a basis for the economic study of the talc deposits; Large scale geologic map of northwest Georgia to be published with manuscripts on the geology, stratigraphy, and economic minerals; Coal exploratory project; Economic investigation of limonite and maganiferous ore deposits; Investigation of sillimanite; Study of the structure, size and composition of the marble deposits at Tate and Marble Hill; Geology, mineral resources and ground water resources of Twiggs, Wilkinson, Washington and Glascock counties; Continuing study of the subsurface stratigraphy of the Coastal Plain of Georgia. *Publication:* Sillimanite and massive kyanite in Georgia (*Bull. 51*).

Water Resources.—*Projects:* State wide ground water projects; statewide surface water study; State wide study of quality of water. *Publication:* Well records supplement to *Bull. 49*. (*Bull. 49A*).

Topographic and Planimetric Mapping.—*Projects:* Planimetric map of Tate marble area; Planimetric map of Murry Hill talc area; Topographic map of selected area of Elbert-Hart sillimanite areas.

IDAHO

Organization.—Idaho Bureau of Mines and Geology, Moscow, A. W. Fahrenwald, Director.

Basic and Economic Geology.—*Projects:* Coal; Sulfur and Phosphate rock. *Publications:* Geological Reconnaissance between Snake and Salmon Rivers north of Riggins, Id. (*Pamph. 73*); Geologic map of Idaho with accompanying text.

ILLINOIS

Organization. — State Geologcal Survey Division, State Department of Registration and Education, Urbana, Dr. M. M. Leighton, Chief.

Basic and Economic Geology.—*Projects:* Areal investigations and geologic mapping; Engineering geology reports on highway conditions, damsites, etc.; Pennsylvanian, Mississippian, Silurian, Ordovician, and Pleistocene stratigraphy; Micropaleontological studies; Paleobotany of the Pennsylvanian; Preparation of a bedrock contour map of the state; Geology and oil and gas resources of the Illinois basin; Secondary recovery of oil in Illinois; Studies of reservoir conditions in Illinois oil pools; Oil possibilities of the Maquoketa and "Trenton" formations in Illinois; Scouting of drilling wells and cooperation with Illinois Scout check; Mapping and study of Illinois coal resources; Lithological and botanical constitution of Illinois coals; Studies to determine the usefulness of coal spores as index fossils; Smokeless briquets from Illinois coal; Investigation of combustion behavior of Illinois coals to develop improved stoker fuels; Investigation of the suitability of low-sulfur Illinois coals for use in preparation of metallurgical coke; Chemical study of tars prepared from Illinois coals in commercial and pilot plant coking operations: The chemical constitution of Illinois coals; Proximate and ultimate analysis of Illinois coals; Fluorspar resources of southern Illinois; Utilization of fluorspar; Petrology of Illinois clays; Bonding clay properties; Surface clay resources of Illinois; Research on clay and clay products; Investigation of the physical properties of Illinois silicas; *Publications:* Annotated synopsis of Paleozoic fossil spores and definition of generic groups (R.I. 91); Corals from the Choteau and related formations of the Mississippian valley region (R.I. 97); Smaller foraminifera of the Porters Creek formation (Paleocene) of Illinois (R.I. 98); Developments in eastern interior basin in 1943 (Ill. Pet. 49); Oil and gas development in Illinois in 1943 (Ill. Pet. 50); Possibilities of production from lime formations given the acid test (Cir. 107); The structure diorama (Cir. 110); Factors controlling oil-well completions in the Illinois basin (Cir. 112); Unitizing the royalty interests (Cir. 114); Resaturate while repressuring (Cir. 118); Oil and gas drilling reports nos. 52-81 (mimeo.); Progress reports in subsurface studies of the Pennsylvanian system in the Illinois basin (R. I. 93); Domestic coke from Illinois coals—an experimental sole-heated oven (R. I. 99); Illinois clays and shales as mortar mix (R. I. 100); Bonding action of clays (R. I. 102); Some clay-water properties of certain clay minerals (R. I. 103); Fluorine compounds in organic synthesis (Cir. 109); Aromatic fluorine compounds (Cir. 115);

The meta monohalogenated benzotrifluorides (Cir. 116).

Water Resources. — *Projects:* Groundwater geology of industrial, urban and special areas; Electrical earth resistivity surveys for subsurface water-bearing sands; Geophysical logging of water wells; Cooperation with Illinois water well driller association. *Publications:* Developments in the applications of geophysics to ground water problems (Cir. 108); Geophysical logging of water wells in northeastern Illinois (Cir. 113).

Topographic and Planimetric Mapping.—*Projects:* Topographic mapping of Buckley, Chatsworth, Crete, Elmwood, Piper City, Ramsey, Vandalia, Wayne City, Woodhull quadrangles. *Publications:* Topographic quadrangles of Freeport, Kewanee, Milford, Mt. Carroll and St. Elmo.

Others.—*Projects:* Economic review of mineral industries; Atlas of Illinois resources. *Publications:* Oil and gas development maps of Clay City, Greenup, Reaches, Allendale; Illinois mineral industry in 1943 (R. I. 101); Industrial minerals produced in Illinois in 1943; Agstone used in Illinois in 1943 (Cir. 111); Architects contribute to Illinois development (Cir. 117).

INDIANA

Organization.—Division of Geology, Dept. of Conservation, Indianapolis 9, Dr. Charles Deiss, State Geologist.

Basic and Economic Geology.—*Projects:* Oil and gas conservation work; Drilling permits and other conservation work; Study of Indianaite and its uses. *Publication:* Oil and gas activity in Indiana in 1944.

Topographic and Planimetric Mapping. — *Publications:* Topographic quadrangles, Bicknell, Brooksburg, Carmi, Carlisle, Epsom, Fairbanks, Florence, Guilford, Hooven, Hymera, Lawrenceburg, Lyons, Merom, Oaktown, Patriot, Plainville, Rising, Sanborn, Vevay.

Others.—*Publication:* Indiana oil and gas well development 1937-1943.

IOWA

Organization.—Iowa Geological Survey, Iowa City, Dr. A. C. Trowbridge, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Pleistocene history of the Mississippi; Stratigraphy of the upper Des Moines series; Geology of Floyd County; Subsurface geology of Iowa County; Subsurface geology of the Cambrian strata in Iowa; Lead and zinc deposits of Center Grove-Pikes Peak area; Agricultural limestone surveys of Adair, Adams, Madison, Page, Ringgold, Taylor and Union Counties.

Water Resources. — *Projects:* Ground water resources of Cerro Gordo County; Geology and ground water resources of Webster County; Structural and ground water conditions of Jordon sandstone; Geology and ground water resources of Cedar Rapids and vicinity; Mineral analysis of underground waters of Iowa; Surface water resources of Iowa for the period 1942-1944.

KANSAS

Organization. — State Geological Survey of Kansas, Lawrence, Dr. Raymond C. Moore, State Geologist and Director.

Basic and Economic Geology.—*Projects:* Stratigraphic correlation of the Pennsylvanian and Permian of the midcontinent based on fusulinids; A comparative study of Tertiary and Pleistocene volcanic ash; Geology and oil and gas resources of Crawford Co.; Collection of mineral statistics in cooperation with the U. S. Bureau of Mines; New mineral resources map of Kansas; Geologic cross sections in eastern Kansas; General stratigraphic and lithologic studies in eastern Kansas; Chemical analysis of Kansas rocks and minerals; The Cheyenne sandstone and adjacent formations in a part of Russell Co.; Oil and gas resources of Bourbon, Neosho, Chautauqua counties; Oil and gas developments in western Kansas during 1945; Oil and gas developments in eastern Kansas; Oil and gas resources of Miami County; Structural development of the Salina Basin; Subsurface rocks of Upper Cambrian and Lower Ordovician age in Kansas; Investigation of oil shales in Kansas; Collection of well samples, cores and logs; Coal resources of the Wabaunsee group; Compilation of maps showing stripped areas in southeastern Kansas coal fields; Compilation of information on coal reserves of Kansas; Clays of the Dakota formation of Kansas; Preliminary report on Kansas clays; Molding sand resources of Kansas; A study of flint gravel deposits in eastern Kansas; Tertiary quartzites in Kansas; Industrial uses of ceramic slag; A study of Pleistocene clays near McPherson for proposed roofing tile plant; Special tests and study of clays near Concordia for proposed brick and tile plant. *Publications:* Pennsylvanian Morrowan rocks and fusulinids of Kansas (*Bull. 52 Pt. 7*); Exploration for oil and gas in western Kansas during 1944 (*Bull. 56*); Oil and gas in eastern Kansas (*Bull. 57*); Stratigraphy of the Marmaton group (*Bull. 58*); The correlation of rocks of Simpson age in north central Kansas with the St. Peter sandstone and associated rocks in northwestern Missouri (*Bull. 60, Pt. 1*); Pennsylvania rocks and fusulinids of east Utah and northwest Colorado correlated with the Kansas section (*Bull. 60, Pt. 2*); Valley erosion since Pliocene "Algal limestone" deposition in central Kansas (*Bull. 60, Pt. 3*); Subsurface geologic cross section from Ford Co. to Wallace Co. (Cross sec. no. 1).

Water Resources.—*Projects:* Geology and ground water resources of "Equua" beds area, Kiowa County, Grant Haskell, Stevens, Seward, Scott, Pawnee, Edwards, Jewell, Republic, Stafford, Barton, Norton, Kingman, Rice counties; Ground water resources of Kansas City industrial area, lower Arkansas valley, Smoky Hill valley; Deep water supplies of southeastern Kansas; Geology and ground water resources of the Pawnee Valley, along the north fork of Solomon River; Quality of water in Elm Creek valley; New water supply for the City of Hutchinson; Observation well program. *Publications:* Geology and ground water resources of Thomas County, Kansas (*Bull. 59*).

Topographic and Planimetric Mapping. — *Projects:* Topographic mapping in Cherokee, Crawford, Labette, Neoshok, Allen, and Bourbon counties.

KENTUCKY

Organization.—State Department of Mines and Minerals, Lexington, Daniel J. Jones, State Geologist.

Basic and Economic Geology.—*Project:* Statewide subsurface study. *Publication:* Geology of the Jackson Purchase.

Water Resources.—*Project:* Louisville ground water study; Blue grass ground water study.

LOUISIANA

Organization.—Louisiana Geological Survey, Baton Rouge, Dr. John Huner, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of Red River and DeSoto Parishes; Geology of Webster Parish; Geology of Allen and Beaureguard Parishes; Natural gas reserves of Louisiana.

Water Resources. — *Projects:* Ground water in the Colfax area; Ground water conditions of the Baton Rouge area with special reference to the shallow artesian sands of the industrial area; Preliminary report of electrical resistivity studies near Jennings and Colfax; Ground water resources of East Baton Rouge and West Baton Rouge Parishes. *Publication:* Ground water resources of Jeff Davis and Acadia Parishes.

Others.—*Publication:* Oil and gas map of Louisiana, 1945.

MAINE

Organization.—Maine Geological Survey, Orono, Dr. Joseph Trefethen, State Geologist.

Basic and Economic Geology.—*Projects:* Molybdenite; Limestone; Clays; Pegmatites. *Publication:* Katahdin pyrrhotite deposit (*Bull. 2*).

MARYLAND

Organization.—Department of Geology, Mines and Water Resources, Johns Hopkins Univ., Baltimore 18, Dr. Jos. T. Singewald, Jr., Director.

Basic and Economic Geology.—*Projects:* Geologic map of Montgomery County; Carroll and Frederick counties report; Paleontologic and petrographic study of Salisbury oil well cores; Core drilling of George Creek coal basin.

Water Resources. — *Projects:* Ground water resources of Baltimore region, Compilation of Maryland Stream Flow Records. *Publication:* Summary of records of surface waters of Maryland and the Potomac River Basin, 1892-1943 (*Bull. 1*).

Topographic and Planimetric Mapping.—*Projects:* Revision of Prince George Co. topographic map. *Publication:* Washington Co. topographic map.

MICHIGAN

Organization.—Geological Survey Division, Department of Conservation, Dr. R. A. Smith, State Geologist and Chief.

Basic and Economic Geology.—*Projects:* Surface geology of the Grant Traverse region; Mineral industries of Michigan; Geology of the Bass Island and Salina formations of southeastern Michigan and contiguous areas of Ontario and Ohio; Geology and mineral resources along the Pennsylvania Railroad; Monograph on the oil and gas fields of Michigan; Pleistocene map of the southern peninsula; Oil maps; Survey of iron ore districts of Iron River, Crystal Falls area, Merriman area, Michigamme Lake district; Survey of gold bearing belt of Marquette Co.; The gypsum formations of Michigan. *Publications:* Pre-historic Mackinac Island (Pub. 43 G. S. 36); Geology of the Mackinac Straits region and subsurface of the northern and southern peninsulas (Pub. 44 G. S. 37); The Niagara formation of Michigan (Pub. 45 G. S. 38); Strategic mineral investigations (Prog. Rept. 10); Geology of the Spruce River and Peshekee River areas (Prog. Rept. 11); Rocks and minerals of Michigan (Pub. 42 Rev.); Geology to Archeology (Mich. Cons. vol. 14, no. 3); Fishin' weather (Mich. Cons. vol. 14, no. 5); Clouds (Mich. Cons. vol. 14, no. 6); Maps (Mich. Cons. vol. 14, nos. 8 & 9); Douglass Houghton (Mich. Cons. vol. 14, no. 10).

Water Resources.—*Projects:* Special survey of ground water conditions and supplies of Great Lansing area; Benton Harbor; Battle Creek area; war industry areas; Surface water surveys of Michigan and lake level stabilization.

MINNESOTA

Organization.—Minnesota Geological Survey, Minneapolis, Dr. Frank F. Grout, Director.

Basic and Economic Geology.—*Projects:* Geology of the Duluth metropolitan area, Geology of Cook County; Geology of central Minnesota; Revision of the Geology of the Mesabi Range; Ilmenite exploration by drilling; Geology of Cuyuna Range; Aluminous clays.

Water Resources. — *Project:* Ground water resources of the northeast quarter of the State.

Topographic and Planimetric Mapping. — *Project:* Topographic mapping of the Stillwater quadrangle.

MISSISSIPPI

Organization. — Mississippi State Geological Survey, University, Dr. William C. Morse, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Four projects on non-metallic minerals. *Publications:* Lee County mineral resources; Itawamba County mineral resources; Rock wool; Mineral wool.

Water Resources.—*Projects:* Two projects on ground water resources and stream gaging. *Publication:* Geology and ground water resources of the coastal area in Mississippi (*Bull. 60*).

MISSOURI

Organization.—Missouri Geological Survey and Water Resources, Rolla, Dr. Edward L. Clark, State Geologist and Director.

Basic and Economic Geology.—*Projects:* Geology of Fredericktown quadrangle; Barite deposits of Washington County; Mineral resources of Morgan County; The subsurface geology of the Gulf coast embayment area in southeastern Missouri; The agricultural limestone resources of Missouri; Magnetic anomalies in Franklin and Crawford Counties; The zinc carbonate deposits of south-central Missouri; The limestone and dolomite deposits of St. Louis Co.; The coal resources of Missouri; The occurrence of volcanic ash in western Missouri. *Publications:* Pyrites deposits of Missouri (Vol. 30, 2 ser.); Recent drilling in northwestern Missouri (R. I. No. 1); Bibliography of geology of Missouri (Vol. 31, 2 ser.).

Water Resources. — *Publication:* Large springs of Missouri (Vol. 29, 2 ser.).

Topographic and Planimetric Mapping. — *Projects:* Topographic maps of Bedford, Cureall, Couch, Sedalia, Sedalia West, Thayer, West Plains, Florida, Grandin, Van Buren, Boss quadrangles. Planimetric maps of Alberton, Boynton, Bucklin, Centerville, Chula, Galt, Lamoni, Lineville, Lucerne, Milan, Mount Ayer, Princeton, Winigan. *Publications:* Topographic maps of Barry, Centralia, Edgar Springs, Bellows Creek, Bolchow, Buckhart, Cassville, Doniphan, Aurora, Fristoe, Gerald, Hannibal, Humansville, Iconium, Ginn, Loury City, Mokane, Morrison, Ozark, Perry, Quincy, Salem, Stone Hill, Sweet Springs, Thornfield, Troy, Valhalla, Vandalia, Warrenton, Waynesville, Weableau.

Others. — *Publications:* Biennial Report of the State Geologist, 63 Gen'l. Assembly, 1945; Mineral resources map of Missouri.

MONTANA

Organization. — Montana State Bureau of Mines and Geology, Butte, Dr. Francis A. Thomson, Director.

Basic and Economic Geology.— *Projects:* Study of stratigraphy and oil production possibilities of Mississippian and Devonian rocks in Montana; Study of factors controlling deposition of Montana ore deposits in sedimentary rocks; Study of Hecla (Bryant) mining district; Compilation of information on placer mining and gold placers; Study of geology and ore deposits of Highland district; Study of non-metallic mineral deposits in Montana. *Publications:* Distribution of sedimentary rocks in Montana and northwestern Great Plains; Factors affecting chromite production in Montana; Mississippian and Devonian stratigraphy in Montana.

Water Resources.—*Projects:* General ground water study in progress.

Others.—*Projects:* Study of the mining problems of small mine operators and prospectors; Mineral dressing studies for the beneficiation of Montana ores.

NEBRASKA

Organization. — Conservation and Survey Division, Univ. of Nebraska, Lincoln, Dr. G. E. Condra, Director and State Geologist.

Basic and Economic Geology.— *Projects:* Subsurface stratigraphic studies; Surface stratigraphic studies; Bryozoan studies; Study of the oil fields of Richardson County; Study of the oil possibilities of the State; Study of the coal deposits as shown by test drilling; Compilation of data on the mineral resources of the state. *Publications:* Bicorbula, a new Permian bryozoa (*Journ. Paleo. 19,* no. 2); Geological calendar (*AAPG Bull. 29,* no. 7); Blancan as a time term in the central great plains (*Sci. 101,* no. 2620); Twenty-five years of study of the Quaternary in the U. S. S. R. (*Am. Jour. Sci. 243,* 1945).

Water Resources. — *Projects:* Ground water studies in Jefferson, Thayer, Fillmore, Polk and Platte counties; Permeability tests in the Platte River valley. *Publications:* Ground water in the Republican River basin in Nebraska (Neb. Water Res. Surv. Water Sup. Paper 1); Water bearing formations and ground water regions of Nebraska.

Others.—*Projects:* Study of mosses, lichens, algae; Study of the plant food for wildlife. *Publications:* Petroleum development in Nebraska in 1944; Land and water conservation problems of the Missouri River basin

(*Neb. Cons. Bull. 26*); Industrial Nebraska in outline (*Neb. Cons. Bull. 28*).

NEVADA

Organization.—Nevada State Bureau of Mines, Reno, Jay A. Carpenter, Director.

Basic and Economic Geology.—*Projects:* Bibliography of geologic literature and maps of Nevada; Geologic study of Goldacres mining district. *Publications:* Quicksilver deposits in Nevada (*Geol. & Mining Ser. 41*); The geology of the Groom district, Lincoln Co. (*Geol. & Mining Ser. 42*).

NEW HAMPSHIRE

Organization.—Mineral Resources Committee, New Hampshire State Planning and Development Commission, T. R. Meyers, Geologist.

Basic and Economic Geology.—*Projects:* Preliminary examinations of New Hampshire foundry sands, clay deposits and feldspar bearing sands.

Others.—*Project:* Surficial geologic map of New Hampshire. *Publications:* Geologic map in structure sections of the Bellows Falls Quadrangle; Geologic map in structure sections of the Mt. Washington Quadrangle; Geologic map in structure sections of the Plymouth Quadrangle.

NEW JERSEY

Organization.—Bureau of Geology and Topography, Trenton, Meredith E. Johnson, State Geologist.

Basic and Economic Geology.—*Projects:* Iron ore deposits of New Jersey; Investigation of sand samples for glass making; Thermal analysis of clays and shales. *Publications:* Mineral resources of New Jersey in war and peace; The mineral resources of New Jersey; Present and future development of New Jersey's mineral resources; Bibliography and Index of the Geology of New Jersey 1753-1945 (*Bull. 59*).

Water Resources.—*Project:* Continued study of the ground water resources of New Jersey.

Topographic and Planimetric Mapping.—*Projects:* Atlas sheets 35 and 36 of the topographic series. *Publication:* Somerville sheet.

NEW MEXICO

Organization.—New Mexico Bureau of Mines and Mineral Resources, Socorro, Dr. E. C. Anderson, Director.

Basic and Economic Geology.—*Projects:* Geology of the Gran Quivira quadrangle; Future oil possibilities of New Mexico; Subsurface geology of Quay County; Survey of the coal industry in New Mexico; Gold reconnaissance of the Hopewell district; Fluorspar in New Mexico; Geology of the Petaca district; Building materials of New Mexico. *Publications:* Geologic literature of New Mexico through 1944 (*Bull. 22*); Stratigraphy and oil-producing zones of the pre-San Andres formations of southeastern New Mexico (*Bull. 23*).

NEW YORK

Organization.—New York State Science Service, Office of Geology, Albany.

Basic and Economic Geology.—*Projects:* Geology of the Cattaraugus quadrangle; Geology of the Schunnemunk quadrangle; Geology of the Utica quadrangle; Glacial geology of the Syracuse region; Geology of the Saranac Lake quadrangle; Cephalopods of the Tully limestones of New York; Hamilton cephalopods of New York. *Publications in Press:* Geology of the Oriskany quadrangle; Geology of the Catskill and Kaaterskill quadrangles; Geology of the Coxsackie quadrangle; Geology of the Lake Sanford titianiferous iron ores.

NORTH CAROLINA

Organization.—Division of Mineral Resources, Department of Conservation and Development, Raleigh, Dr. Jasper L. Stuckey, State Geologist.

Basic and Economic Geology.—*Projects:* Deep River coal field; Manganese deposits in North Carolina; Mica resources of North Carolina; Limestone and marls of the Coastal Plain; Sillimianite in North Carolina. *Publications:* Economic Geology of the Spruce Pine pegamite district; Mica deposits of the Sylva-Franklin district; Kaolin deposits of North Carolina.

Water Resources. — *Projects:* Water resources of the crystalline rocks of North Carolina. *Publications:* Progress report on the ground water of North Carolina; Ground water in the Halifax area.

Topographic and Planimetric Mapping.—*Project:* One topographic mapping project.

NORTH DAKOTA

Organization.—North Dakota Geological Survey, Grand Forks, Dr. Wilson M. Laird, State Geologist.

Basic and Economic Geology.—*Projects:* Geology and Geography of North Dakota; White River formation in North Dakota; Geology of the west side of the Lake Agassiz basin; Geology of the Kelly slough area; Preliminary structural study of the Nesson anticline; Coal correlation in western North Dakota; Limestone and Cement rock investigations in North Dakota. *Publication:* Heavy mineral correlation of the Fox Hills, Hell Creek, and Cannonball sediments, Morton and Sioux Counties, North Dakota (*Bull. 19*).

Water Resources. — *Projects:* Ground water studies in Fargo-Moorhead area, Minot area, Fessenden area; Observation well program. Studies carried on in cooperation with the USGS and the State Water Commission. *Publication:* A Reconnaissance of possible well irrigation areas (*Bull. 20*).

Others. — *Publication:* Twenty-Third Biennial Report of the North Dakota Geological Survey.

OHIO

Organization.—Geological Survey of Ohio, Columbus 10, Dr. Wilber Stout, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of the Hocking Valley; Geology of Holmes County; Monongehela series; Limestones of eastern Ohio; Sharon conglomerate; Iron ores of Ohio. *Publications:* Iron ore bearing formations of Ohio (*Bull. 45*); Occurrences of flint in Ohio (*Bull. 46*); Recent information on Maxville limestone (Info. Cir. 3).

OKLAHOMA

Organization.—Oklahoma Geological Survey, Norman, Robert H. Dott, Director.

Basic and Economic Geology.—*Projects:* Pennsylvanian stratigraphy of east-central Oklahoma; Morrow series in northeastern Oklahoma; Tulsa County; Subsurface structure map of the state; Insoluble residue studies of Arbuckle limestone; Le Flore and Haskell Counties; Dolomite in Arbuckle Mts.; Clays and shales; Woolrock; Oil field brines; Volcanic ash; Asphaltites. *Publications:* Geology and glass sand resources, Central Arbuckle Mts. (*Bull. 65*); Fluoride removal from drinking water (Cir. 25); The Potentials of ground water supplies of the southwest; The Hopper; Oklahoma raw materials for the glass industry.

Water Resources.—*Projects:* Studies of the Rush Springs sandstone; Garber-Wellington; North Canadian river valley; Beaver County; Miami district; Tipton terrace; several municipal water supplies; observation well program; quality of water.

Others.—*Projects:* Assistance to local chambers of commerce in preparation of brochures on mineral resources: Oklahoma Mineral Industries Conference; Sets of minerals, rocks, and fossils for high schools.

OREGON

Organization.—Oregon State Department of Geology and Mineral Industries, Portland, F. W. Libbey, Director.

Basic and Economic Geology.—*Projects:* Geologic mapping of Telocaset quadrangle; Preliminary geologic map of St. Helens quadrangle; Sampling of Tertiary sections in western Oregon for microfossil study; Investigation of mineral deposits in northwest Oregon; Ceramic testing of Oregon clay deposits; Economic and geologic survey of ore deposits in Mt. Reuben area; Geologic survey of silica sand deposits, western Oregon; Mapping of limestone deposit of southwestern Oregon; Study of use of light weight aggregate in making building blocks. *Publications:* Geology and coal resources of Coos Bay quadrangle (*Bull. 27*); Ferruginous baurite deposits of northwestern Oregon (*Bull. 29*); Mineralogical and physical composition of sands of Oregon coast from Coos Bay to mouth of Umpqua River (*Bull. 30*); Eugene silica sand casting results obtained by Oregon Steel Foundry, Portland.

Topographic and Planimetric Mapping. — *Publications:* Geologic map of Coos Bay quadrangle; Preliminary geologic map of St. Helens quadrangle; Quicksilver deposits in Oregon.

PENNSYLVANIA

Organization.—Topographic and Geologic Survey, Harrisburg, Dr. George H. Ashley, State Geologist.

Basic and Economic Geology.—*Projects:* Geology and mineral resources of southeastern Clearfield County; Mississippian stratigraphy; Somerset County report; Study of deep oil and gas sands; Oil and gas of Warren, Sheffield, Kinzua, and Butler quadrangles; Detailed report of oil and gas sands of southwestern Pennsylvania; Sand maps for each of the sands for the whole oil and gas area of Pennsylvania; Anthracite reserves of Pennsylvania; Study of the iron ore deposits. *Publications:* Atlas Smicksburg quadrangle (No. 55); Iron-manganese ore deposit at White Rocks, Cumberland Co. (*Bull. M 26*); Manganese minerals of Pennsylvania (*Bull. M 27*); Oil and gas farm line maps of Franklin and Oil City quadrangles (*Spec. Bull. 2*); Property line maps showing oil and gas fields of the Hilliards quadrangle (*Spec. Bull. 3*).

Water Resources.—*Projects:* Continuation of well gaging; Intensive study of the ground water resources of the Philadelphia region. *Publication:* ground water investigations in Pennsylvania (*Int. Aff.* vol. 13, no. 2).

Topographic and Planimetric Mapping.—*Projects:* First Fork; Cameron; Driftwood; Sinnemahoning; Tamarack; Westport; Keating; Houtzdale. *Publications:* Philipsburg; Powell.

Others.—*Publications:* Pennsylvania's advantages if war drives people underground (*Int. Aff.* vol. 12, no. 12); Small space for the storage of Russian oil in Pennsylvania (*Int. Aff.* vol. 13, no. 4); Iron ores of the Cumberland Valley and their future (*Int. Aff.* vol. 13, no. 5); The Dinosaur, he sought security; found death (*Int. Aff.* vol. 13, no. 5); Grand Canyon of Pennsylvania (*Int. Aff.* vol. 13, no. 7); Geologic specimens, how to collect (*Int. Aff.* vol. 13, no. 9).

RHODE ISLAND

Organization.—Rhode Island Industrial Commission, Mineral Resources Committee, Providence, Dr. Alonzo Quinn, Chairman.

Basic and Economic Geology.—*Projects:* Bed rock of the Pawtucket quadrangle; Glacial geology of the Pawtucket quadrangle; Bed rock and glacial geology of the Georgiaville quadrangle.

Water Resources.—*Projects:* Ground water resources of Providence; Ground water resources of the Pawtucket quadrangle. *Publication:* Ground water resources of the Providence area (*Bull. 1 & 2*).

SOUTH CAROLINA

Organization. — South Carolina Geological Survey, Columbia, South Carolina. Dr. Stephen Taber, State Geologist.

SOUTH DAKOTA

Organization.—State Geological Survey, Vermillion, Dr. E. P. Rothrock, State Geologist.

Basic and Economic Geology.—*Projects:* Glacial geology in the James Valley; Geology of the Missouri Valley. *Publications:* Geology of South Dakota Part III, Mineral Resources (*Bull. 15*); Geologic Survey of Dewey and Corson Counties (R. I. 49); Mineralogy of some pegmatites near Custer (R. I. 50).

Water Resources.—*Projects:* Stream gaging; Water levels on lakes; Observation wells.

Topographic and Planimetric Mapping. — *Project:* Topographic mapping near Miller.

Others.—*Publication:* Biennial Report of the State Geologist for 1942-44.

TENNESSEE

Organization.—Tennessee Division of Geology, Nashville 3, H. B. Burwell, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Subsurface stratigraphy; Oil and gas in southern Cumberland plateau; Barite deposits of east Tennessee; Middle Tennessee phosphate deposits. *Publications:* Oil and gas in the northern Cumberland plateau; The subsurface stratigraphy and structure of the Stones River group in northeast central Tennessee; The subsurface stratigraphy and structure of the pre-Trenton Ordovician and upper Cambrian rocks of central Tennessee; Geology and manganese deposits of northeastern Tennessee.

Water Resources.—*Projects:* Gaging surface streams.

TEXAS

Organization.—Bureau of Economic Geology of the University of Texas, Austin, Dr. John T. Lonsdale, Director.

Basic and Economic Geology.—*Projects:* Geology and minerals of Llano region; Carboniferous of the Llano region; Investigation of Coastal Plain geology; Geology of Houston County; Geology of the Texas High Plains; Study of river terraces, upper Brazos and Colorado rivers; Igneous geology of Trans-Pecos; Mineral resources of Trinty river basin; Revision and compilation of data for new edition of map showing oil and gas fields and structure; Study of Ellenburger group of formations; Mineral resources of Trans-Pecos, Texas; Mineral locality map of Texas. *Publications:* Carboniferous rocks of the Llano region (*Univ. Tex. Pub. 4246*); Contributions to Geology, 1944 (*Univ. Tex. Pub. 4401*); Ellenburger group (*Univ. Tex. Pub.*).

Others.—*Publications:* Building stones of central Texas (*Univ. Tex. Pub. 4246*); Texas mineral resources (*Univ. Tex. Pub. 4301*); Structural map of Texas, 3rd ed.; Geologic map of 4 quadrangles in Houston County, Texas, preliminary ed.

VERMONT

Organization.—Vermont Geological Survey, Burlington, Elbridge C. Jacobs, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of the Newport quadrangle; Vermont copper deposits; Non-metallic producing companies.

Topographic and Planimetric Mapping.—*Projects:* Corinth quadrangle.

VIRGINIA

Organization.—Geological Survey Division of Virginia Conservation Commission, Charlottesville, Dr. Arthur Bevan, State Geologist.

Basic and Economic Geology.—*Projects:* Geology and mineral resources of Clark Co.; Geology and mineral resources of Frederick Co.; Outline of the geology and mineral resources of Smyth Co.; Geology of the Hot Springs district; Geology of Shenandoah National Park and environs; Geology of Virginia state parks; Outline of geology of Virginia; Common rocks and minerals of Virginia; Geology and minerals resources of the following quadrangles; Buena Vista, Abington, Lovingston, Lynchburg, Stony Man, and Vesuvius; Guidebook to the Lee Highway (U. S. Route 11); Guidebook to U. S. Route 20; Tertiary foraminifera; Geology of oil in Lee County; Bauxite in Augusta County; Northeast Piedmont zinc district; Gossan lead district; Industrial limestones and dolomites of Virginia; Mica deposits; Piedmont marble. *Publications:* Commercial granites and other crystalline rocks of Virginia (*Bull. 64*); Industrial limestones of Virginia; Northern and central parts of the Shenandoah valley (*Bull. 65*); Industrial limestones and dolomites in Clinch valley district (*Bull. 66*); Metamorphism along the Pulaski Fault (Reprint 11); Lower middle Ordovician stratigraphy of Shenandoah valley (Reprint 12).

Water Resources.—*Projects:* Public and industrial ground water supplies of the Roanoke area; Chemical character of the Coastal Plain ground water. *Publication:* Selected well logs in the Virginia coastal plain north of the James River.

Topographic and Planimetric Mapping.—*Projects:* Boone Mille; Broadway; Callaghan; Clifton Forge; Craigs Creek; Dillon Mill; Edinburg; Goshen; McDowell; Mt. Jackson; New Canton; Parnassus; Peaks of Otter; Pounding Mill; Radford; Strasburg; Warm Springs.

Others.—*Publications:* Record of Virginia mineral production in 1943 (Circ. 4); Planning mineral resources into mineral industries (Circ. 5).

WEST VIRGINIA

Organization.—West Virginia Geological and Economic Survey, Morgantown, R. C. Tucker, Acting State Geologist.

Basic and Economic Geology.—*Projects:* Gas analysis; Studies on acidizing Big Lime; Wetzel County oil and gas; Oriskany structure map of the state; Examination of iron ores; Clays of West Virginia. *Publications:* Fifty common rocks and minerals of West Virginia (*Bull. 10*); Well sample records (Vol. 17).

Water Resources.—*Project:* Pt. Pleasant ordnance plant area. *Publications:* Ground water conditions along the Ohio valley at Parkersburg, West Virginia, (*Bull. 9*).

WISCONSIN

Organization.—Wisconsin Geological and Natural History Survey, Science Hall, Madison 6, E. F. Bean, State Geologist.

Basic and Economic Geology.—*Projects:* Metallic and non-metallic investigations in the vicinity of Wasau and Niagara.

Water Resources. — *Projects:* Ground water surveys in progress.

Topographic and Planimetric Mapping. — *Projects:* Planimetric mapping in the northern part of the State; Topographic mapping in the northern part of the western upland. *Publications:* Planimetric maps of Black River, Clam Lake, Kennan, Mellen, Kennedy, Rib Lake.

Others.—*Projects:* Soil surveys in Langlade and Barron Counties.

WYOMING

Organization.—Geological Survey of Wyoming, Laramie, Dr. Horace D. Thomas, State Geologist.

Basic and Economic Geology.—*Projects:* Tertiary history of the Medicine Bow Mts.; Vanadium in Wyoming crude oils; Titaniferous magnetite deposits of the Laramie Range; Phosphate rock in the Lander area, Fremont Co.; Anorthosite of the Laramie Range; Wyoming sericite deposits; Jade occurrences in Wyoming; Bentonite in the Casper area, Natrona County.

RECLAMATION AND IRRIGATION

By William E. Warne

Assistant Commissioner, Bureau of Reclamation,
Department of the Interior

IRRIGATION FACILITIES IN THE WEST

More than 4,000,000 acres of land in arid and semi-arid regions of the West are now served by irrigation facilities constructed by the Bureau of Reclamation. This Federal agency, established in the Department of the Interior 43 years ago, has the responsibility for conserving and making use of the water resources of the West.

To harness great rivers such as the Colorado and the Columbia, Bureau engineers have designed the highest and the largest dams in the world—Boulder Dam on the Colorado and Grand Coulee Dam on the Columbia. Great structures like these are the keys to multiple-purpose projects that provide water for irrigation, generation of hydroelectric power, municipal water supplies, flood control, improved navigation, and in addition, yield recreational and wildlife benefits.

MISSOURI RIVER BASIN PROJECTS

The Bureau of Reclamation now has in operation, under construction, or authorized more than 100 projects, including 29 initial projects in the Missouri River Basin, authorized by the Flood Control Act of 1944.

The Missouri Basin Plan is the first of the comprehensive river-development programs designed by the Bureau to receive Congressional approval. Similar studies are being prepared for 14 other river basins in the West.

POST-WAR MULTIPLE-PURPOSE PROGRAM

Realizing the need for settlement and employment opportunities, the Bureau presented to the Congress April 12, 1945, an inventory of 415 potential irrigation and multiple-purpose projects. More than 100 of these have been authorized and construction is under way on some of them. This construction program will be accelerated as funds are made available.

If the whole inventory is approved by the Congress, the Bureau's post-war program will create approximately 200,000 new farms, extending irrigation service to nearly 11,000,000 acres, and in addition furnishing supplemental water for some 11,000,000 acres now inadequately watered. Power capacity would be increased from the present 2,439,300 kilowatts to 9,324,000 kilowatts.

FOOD PRODUCTION PROJECTS

From the 4,000,000 acres now served by Bureau facilities, the West and the nation have benefited not only through increased production of essential foods, but also by greater purchasing power made possible by higher crop values.

The gross value of 1944 food and forage crops on Bureau projects totaled more than $411,000,000. In meeting wartime food needs, farms on Reclamation lands produced more than 11,000,000 tons, including feedstuffs that maintained meat and dairy production at a high level. Major crops produced on these irrigated lands are sugar beets, vegetables, fruits, and alfalfa.

The average per-acre value of crops on Bureau-irrigated lands in 1944 was the highest on record, an average of $99.27 per acre, compared with $96.82 in 1943 and $47.30 in 1941. The highest average crop value in 1944 was reported for the Tieton division of the Yakima Project at $598.34 per acre, closely followed by the Okanogan Project at $592.32 per acre. Both are in the State of Washington.

Gross crop values exceeding an average of $100 per acre were also reported on the following projects—the Salt River (Arizona); Yuma (Arizona-California); Orland, Imperial Irrigation District, and Central Valley (California); Fruitgrowers Dam, and the Orchard Mesa division of the Grand Valley Project (Colorado); Rio Grande (New Mexico-Texas); Klamath (Oregon-California); Owyhee Ditch Company (Oregon-Idaho); and Provo River and Weber River (Utah).

POWER PRODUCTION

Besides contributing to the agricultural supplies of the nation, Bureau of Reclamation projects made an outstanding record in power production in 1945. Hydroelectric plants on Bureau projects in the fiscal year 1945 produced almost 14,000,000,000 kilowatt hours of electric energy, most of which went to war industries.

Electrical energy, generated at Bureau of Reclamation dams, pumps water for irrigation, and supplies power for cities and towns with a combined population of over 4,000,000. When the construction program now authorized is completed the various services of the Bureau, including irrigation, municipal water, and power, will be extended to regions in which more than 10,000,000 persons live.

Hydroelectric energy produced on its projects will be an important factor in stimulating the establishment of hundreds of small businesses and in the development of food processing plants, mineral, and other industries in the West.

During the year, all construction on Bureau of Reclamation projects was geared to war food and war power programs. With wartime restrictions lifted, it will be possible, where sufficient funds are available, to complete many projects which are now under construction and to begin work on others that have been authorized but on which construction was deferred.

Ten dams under construction at the end of the year were as follows:

CONCRETE DAMS

Dam	Reservoir Capacity (Acre Feet)	Height (Feet)	Per Cent Complete
Altus	151,650	110	98
*Keswick	23,000	158.5	85

EARTH DAMS

Dam	Reservoir Capacity (Acre Feet)	Height (Feet)	Per Cent Complete
Anderson Ranch	493,199	444	60
Newton	5,500	90	97
Deerfield	15,000	100	75
Scofield	73,000	68	50
Wickiup	180,000	100	80
Box Butte	31,500	66	75
Jackson Gulch	10,000	180	20
Shadow Mountain	15,000	44	60

* No construction during fiscal year ended June 30, 1945.

IRRIGATION CANALS

In addition to dams and power plants, the Bureau constructs many other irrigation facilities. Completed during the year was the 37-mile Madera Canal in the Central Valley Project (California). Construction was started on the 160-mile Friant-Kern Canal, and on other important features of the great Central Valley Project.

The first section of the Conchas Canal was completed in 1945 to provide water for an additional unit of 7,000 acres in the 45,000-acre Tucumcari Project (New Mexico).

FLOOD-CONTROL AND IRRIGATION DAMS

Construction passed the half-way mark on the Anderson Ranch Dam, Boise Project, Idaho. When completed this will be the highest earthfill dam in the world. It will provide flood control and store irrigation water for 290,000 acres now inadequately watered.

An earth dam is under construction on the Deschutes Project, Oregon, to provide a full water supply for approximately 50,000 acres and supplemental water to an additional 50,000 acres. Construction was also continued on the canals and distribution system for irrigating 32,000 acres on the Yakima Roza Project, Washington.

Work progressed on the Gila Project in Arizona and on the Coachella Canal in southern California. Other construction included lining of the 13-mile Alva B. Adams Tunnel under the Continental Divide. This is a part of the Colorado Big Thompson Project. A limited program of work was also carried on at Green Mountain and

Shadow Mountain dams on this project which will serve 615,000 acres in northeastern Colorado. Work of Reclamation engineers included, among other major undertakings, preparation of the designs and specifications for the construction of the $17,500,000 San Diego Aqueduct.

CONSTRUCTION SURVEY

Reclamation construction during the year involved the use of more than 300,000 barrels of cement and 220,000 cubic yards of concrete were placed. Fifty miles of canals were constructed and work was continued on other water distribution facilities.

A survey of cumulative construction by the Bureau of Reclamation from June 30, 1902 to June 30, 1945 shows that the Bureau of Reclamation has built 15,495 miles of irrigation canals. Storage reservoirs behind its dams have a capacity of 66,558,840 acre-feet and its storage and diversion dams combined contain a total of 83,743,155 cubic yards of materials.

The 347 tunnels constructed by the Bureau have a combined length of 560,271 feet. Thirty-one hydroelectric plants operating on its projects have an installed capacity of 2,439,300 kilowatts. Part of the energy is marketed over 2,164 miles of transmission lines built by the Bureau.

In the construction of its projects the Bureau has excavated 606,313,120 cubic yards of earth and rock, poured 33,671,861 cubic yards of concrete, and used 38,289,133 barrels of cement.

Bureau of Reclamation irrigation works built over the 43-year period also include 209,016 canal structures, 5,196 miles of waste water ditches and drains, 13,676 bridges with a combined length of 362,002 feet, 23,620 culverts totaling 1,101,146 feet, 6,318 flumes with a combined length of 873,989 feet, 331 pumping plants having a discharge capacity of 7,422 cubic feet per second, and protective levees containing 12,758,365 cubic yards of materials.

MATERIALS AND EMPLOYMENT FACTORS

Although the Bureau's projects are located in the 17 western states, their construction creates job opportunities from Maine to California. Behind every man on the construction job there are hundreds of helpers thousands of miles away. Materials needed for this work include such basic products as iron and steel, cement, electrical equipment and supplies, foundry and machine shop products, and lumber. Much of this material and equipment comes from the 31 states outside the arid and semi-arid regions of the West. Thousands of man-hours of labor are required in distributing, processing, and transporting these materials to a construction site. Thus, building of a Reclamation project creates a nationwide volume of work.

Schedules on incompleted projects and on proposed projects are being adjusted to meet employment demands. Completion of all proposed developments, however, would not mean the end of employment opportunities. It will open more and more jobs on farms, in businesses in project towns, and in factories of the other sections of the country which will be kept busy supplying new western markets.

PUBLIC LANDS

By Fred W. Johnson

Commissioner, General Land Office, Department of the Interior

---

ADMINISTRATION

The administration of 778,000,000 acres of public land in the United States and Alaska so as to insure maximum beneficial use of the nation's natural resources in the post-war period, was the major objective of the General Land Office at the close of the 1945 fiscal year. With the approaching end of the war, foreshadowing a transition from military to peace-time activities, operations fulfilling the requirements for public land utilization in the fighting program gave way to the formulation of plans for the solution of after-the-war problems.

Meantime, this official real estate agent of the Federal Government closed its books for the fiscal period with a net profit both in conservation advancement and in financial gains in the administration of the public domain.

WAR SERVICE

During the war years, the General Land Office quickly met the demands for land and resources required for the prosecution of the military program. More than 16,000,000 acres of the public domain were made available as sites for camps, gunnery ranges, aviation bombing fields, tank training areas, and other combat training zones. In addition, many secret withdrawals of land were made to assist the Army and Navy in carrying on the war, and several millions of acres were placed in a state of reserve to permit the untrammelled development for war purposes of the petroleum and other mineral resources in the areas. At the same time, the activities of trained investigators, cadastral engineers, and other experts in land identification, classification, and management were centered almost entirely in war-connected tasks, ranging from the examination of thousands of mining claims to the segregation of areas in Arizona, New Mexico, and other states for use in experimentation and in the development of the atomic bomb. Never before in history had the public lands under the jurisdiction of the General Land Office been called upon to provide such an abundant supply of natural resources for military purposes as in the period of the Second World War.

POST-WAR PROBLEMS

Meantime, the essential necessity for continued management of the public lands under progressive conservation policies for use and development with an eye to the requirements of the future, became increasingly evident during the year. The trend of scientific research already points the way to new fields of usefulness for the public domain, broadening the scope of activities in the development of resources beneath the surface and expanding the opportunities for utilization of the land itself. The wider horizons for mineral uses revealed by the discovery and development of the atomic energy, the steadily mounting requirements for lumber and other forest products to repair the ravages of war, and the growing demands from ex-servicemen for land settlement opportunities serve to illustrate the trend toward more extensive usage in the years immediately ahead. New methods and new laws must be provided with which to carry out these new tasks which, in effect, mark the beginning of a new era in national land administration.

Land administration experiences in connection with the prosecution of the war sharply accentuated the pattern for efficient management of the public domain in time of peace. At the close of the 1945 fiscal year, definite alterations in Federal law and in procedures of the General Land Office were revealed as imperatively needed to bring about that efficiency to which the public is entitled and without which the maximum beneficial use of the national lands and their resources can not be assured. Some of these needs had long been recognized, but their enactment was held in abeyance for the duration of the war.

Today, freed from the restriction arising from the necessity for emergency military action, problems awaiting solution include the rejuvenation of Federal mining laws and the enactment of a general mineral leasing statute. A thoroughgoing examination of the remaining vacant public land to determine its availability for homesteading use also should be undertaken to meet the needs of returned veterans for land settlement opportunities in the United States and Alaska.

Full benefit from the use of the public land depends, however, upon much more than mere legislative enactments, important though they may be to proper administration by the General Land Office. It depends also upon a program of utilization based upon a carefully planned integration of the objectives and operations of the office.

LAND SETTLEMENT OPPORTUNITIES

The end of the war centered the thoughts of many American servicemen and servicewomen upon the prospects of establishing a permanent home upon the public lands of the United States. Visualizing broad opportunities for settlement such as existed in the earlier stages of American history, thousands of members of the armed forces turned to the General Land Office during the last fiscal year for information and guidance in matters connected with the Federal homestead laws. A special leaflet dealing in terse, question-and-answer form with the problems of homesteading on land in continental United States, was prepared for the benefit of the men and women in the military service, and distribution of other informational material dealing with the public lands both on the mainland and in Alaska was expedited in response to popular demand.

While prepared to render all possible assistance in the solution of land settlement problems for both military personnel and civilians, attention is called by the General Land Office to the fact that, since homesteading as popularly understood, first was set under way by President Lincoln 83 years ago, good farm land upon which an agricultural living can be made as required by the homestead law is scarce on the vacant, unappropriated, and unreserved public domain in the United States.

Meanwhile, another type of use of the public lands which does not require the making of a living by agriculture, during 1945 became one of the major operational problems confronting the Office. This opportunity for land settlement by World War veterans as well as civilians is afforded under the terms of a law which authorizes the lease or sale of not to exceed five acres of public land for home, camp, cabin, health, convalescent, recreational, or business purposes.

Popularity of the plan is indicated by the fact that applications for leases under the law totalled more than 3,200 in 1945, as compared with only 1,600 during the preceding six-year period. To help meet this increased demand, special land examination had to be made, with the result that more than 30,000 acres of land, the major portion of which is located in southern California, were recommended for classification as suitable for use under the Small Tract Act.

As the fiscal year drew to a close with prospects for a rapid return of service personnel to a civilian status, interest in the small tract land settlement program increased, areas in the vicinity of Tucson and Phoenix, Ariz., Sacramento, Calif., and Denver, Col., being applied for, as well as tracts in Idaho, Nevada, New Mexico, and Oregon. Further expansion of the program to provide still more areas for lease and a streamlining of administrative processes to facilitate the work is an essential task confronting the General Land Office in the postwar period.

ALASKAN DEVELOPMENT

The fact that more than nine-tenths of the 375,000,000 acres of land and water in Alaska consist of public domain remaining in Federal ownership, places upon the General Land Office a large share of direct responsibility for the proper administration and development of the natural resources of the territory. Foremost among these is the obligation to supply authentic information concerning the various types of land use opportunities within its borders. During 1945, this requirement was met in part by the distribution of an information bulletin on Alaska which not only served as a standard reference publication for other Federal agencies and members of Congress, but also provided thousands of servicemen and women with data relating to the privileges and obligations inherent in the administration of the public land laws in Alaska.

Shortly after the close of the fiscal year, Congress enacted a law making the provisions of the Small Tract Act, which hitherto had been confined to Continental United States, equally applicable to the public lands in Alaska. As a result, plans were immediately set under way to gear General Land Office operations in the territory to the requirements of the new law.

At the same time, definite steps were taken for strengthening the organization in Alaska to render effective service in meeting land settlement and other problems of resource development during the post-war period. Specifically, a new regional field office of the Branch of Field Examination was established at Anchorage to handle matters formerly routed through San Francisco, while the Alaskan Fire Control Service was vested with broader authority in the protection of public land areas from fire and in the use of timber from the public domain. In addition, special examination of some of the public lands in the territory was made during the summer of 1945 to insure up-to-date evaluation of the areas from the standpoint of suitability for agriculture or other use in the economic development of Alaska.

SUSTAINED YIELD CONSERVATION

Maximum benefits from the natural resources of the United States in the post-war period will require a complete cessation of the haphazard use which in former years led to denuded timbered areas, abandoned "ghost towns," and the depletion through over-grazing of the rangelands of the west and southwest. Responsibility for the attainment of this goal on the public lands under national conservation policies rests in large measure upon the operational activities of the General Land Office.

Foremost among its obligations in this field is the establishment of sustained-yield forest management practices on all the Federal lands under its jurisdiction, as required by Congressional mandate enacted during the 1945 fiscal year. Under this program, forestry operations on the timbered public domain eventually will be brought into a balance ratio in which the volume of tree-cutting and of tree-growing will be regulated so as to provide a continuing supply of those natural resources on the land.

Adequate protection from fire of the 262,500,000 acres of timber, grass, and brush land areas of the public domain in the United States and Alaska also is an additional administrative task assumed by the General Land Office during 1945, and plans were completed at the close of the fiscal year to preserve these resources for post-war use.

OREGON AND CALIFORNIA REVESTED LANDS ADMINISTRATION

World demands for lumber and other forest products in the post-war period were reflected in operations and plans of the Oregon and California Revested Lands Administration during the 1945 fiscal year. Established in 1938 to carry out a broad program of sustained yield forestry management on 2,500,000 acres of land in western Oregon, which once was encompassed in a Federal railroad grant but later revested in Government ownership, this branch of the General Land Office maintains its headquarters at Portland, Ore.

Rated as the world's largest experimental laboratory in practical cooperative sustained yield forest management, the "O. and C." lands provide the testing ground for a world pattern of forestry economy. Under this program all elements would join in operations under which tree growing would reasonably balance tree cutting to the end that a continuing supply of raw materials will be available for the existence of industry and dependent communities. Definite plans for the further advancement of the sustained yield program in the Pacific Northwest were made by the Administration during the fiscal year.

Meantime, definite contributions to the nation's lumber needs were made during the year from the "O. and C." lands which contain one of the finest stands of Douglas fir trees in the United States. In 1945, sales of timber from these lands exceeded 426,000,000 board feet valued at approximately $1,518,000.

The use of aerial mapping as a means of more speedily completing an inventory of timber resources in these lands is expected to form a part of the work program for 1946.

Further augmenting the post-war program for betterments in the industry on the Pacific Coast is the planting of seedlings on the denuded lands by the "O. and C." organization. Utilizing Civilian Public Service enrollees, more than 1,550,000 seedlings were planted and 350,000 trees prepared for transplanting in the field during the year.

With the end of the war, studies for broader use of the "O. and C." lands for recreational, grazing and other uses, which were laid aside during the emergency, were ready to be resumed at the close of the 1945 fiscal year.

CADASTRAL ENGINEERING SERVICE

Plans for reorganization of this scientific branch of the General Land Office so as to meet the demands for accurate surveys in connection with land administration during the post-war period were brought to a completion near the end of the 1945 fiscal year. Involving the transfer of headquarters for this work from Denver to Washington, D. C., the reconversion program of the Cadastral Engineering Service contemplates the execution of a greater amount of actual survey work in the field than in previous years.

One of the major requirements in the first transfer of land from Government to private ownership, cadastral surveying consists of careful measurement of areas on the ground, the recording of such measurements by the placing of monuments or other markers, and the preparation of maps scientifically compiled from field notes made by trained engineers at the time of the on-the-ground measurements.

First undertaken 150 years ago in accordance with the ordinance of 1795, these surveys were carried on in 23 states and in Alaska in order that the identification of the assets in the people's $250,000,000 real estate might be adequately protected in 1945.

Altogether a total of 9,231 miles was surveyed or resurveyed in 1945, some of the 1,287,490 acres being encompassed in areas acquired for military purposes. With an increase in land settlement in Alaska looming large as a potential post-war development, the plans of the Cadastral Engineering Service include an expansion of survey work there.

BRANCH OF FIELD EXAMINATION

The examination of land upon which is based the rejection or approval of plans for its use under the public land laws, is the major responsibility of this branch of the General Land Office. By maintaining a staff of trained technicians, including mining and civil engineers, geologists, lawyers, auditors, timber cruisers, range specialists, and others experienced in land investigations, the Branch handled many difficult and unusual types of cases during 1945. For example, the reappraisal of unsold lots in a townsite in upper Miami Beach, Florida, was made by field examiners from this agency, and the subsequent auction sale brought out bidders who ran prices up to a new high in Florida beach property.

At another period of the year agents of the Branch were assigned to investigate mining claims on areas set aside as military bombing ranges, while a third group made extensive investigations in the now famous Alamogordo area in New Mexico where the atomic bomb experimentation was carried on.

Paving the way for more efficient service to the public in the development of Alaska, a new regional office was established at Anchorage. Other regional offices maintained by the Branch of Field Examination are located in San Francisco, Billings, Mont., Salt Lake City, and Albuquerque, N. M.

Responsibilities placed upon the General Land Office by Congress in the enactment of the sustained yield forestry management act greatly increased the task of the Branch of Field Examination during the 1945 fiscal year in preventing trespass upon the public domain. Altogether, over $70,000 was collected in payment of trespass violations of the public land laws.

PUBLIC LANDS FOR PASTURES

In the 1945 fiscal year the use of more than 12,400,000 acres of public land in the United States and Alaska for the grazing of livestock was supervised by the General Land Office as another element in its administration of the people's real estate assets. Consisting of tracts in Alaska suitable for grazing purposes and similar areas in the United States not included in established Federal grazing districts, 12,479,270 acres were made subject to use under 10,593 leases involving annual rental of $229,523.

In order that maximum production of meat and other livestock products might be provided from the public lands during the reconversion period, plans were being formulated at the close of the 1945 fiscal year to increase the stocking capacity of the range lands. It is estimated that, with proper range facilities and improved range practices, the capacity of the leased area could be increased 50 per cent and an additional 10,000,000 acres leased if the improvement and rehabilitation program is carried forward to completion. Meanwhile, operations of the Range Development Service of the General Land Office, previously halted by war conditions, were scheduled for resumption as the end of the war approached.

Under the supervision of this Service, improvements on the range such as the development of springs and wells, the construction of fences, the reseeding of areas denuded of vegetation, and the control of rodents and other predatory animals is undertaken in cooperation with the stockmen.

AREA OF THE PUBLIC LANDS

The area of public lands remaining in Federal ownership, including Indian trust and tribal lands, as of June 30, 1945, amounted to about 413,000,000 acres in the public land states and about 365,000,000 acres in Alaska. Approximately 400,000,000 acres of these public lands were vacant, unappropriated, and unreserved as follows: 37,000,000 acres in the states outside of Federal grazing districts; 133,000,000 acres within such districts; and 230,000,000 acres in Alaska. During the

ACREAGE OF LANDS PATENTED WITH MINERALS RESERVED TO THE UNITED STATES

(as of June 30, 1945)

Type of Mineral Reservation	Patented During Fiscal Year 1945	Total Patented Through June 1945
Reservation of all minerals:		
Under Stock Raising Act	15,094	33,586,052
Under other acts	50,684	2,376,256
Total	65,778	35,962,308
Reservation of specific minerals:		
Coal	5,084	10,875,615
Others[1]	7,342	1,928,702
Total	12,426	12,804,317
Grand total	78,204	48,766,625

---

[1] Includes coal reserved in combination with other minerals.

year 692,000 acres were withdrawn for various public purposes while withdrawals reserving 9,497,000 acres were revoked.

Of the approximately 778,000,000 acres remaining in Federal ownership in the States and Alaska, 118,000,000 acres in the States and 363,000,000 acres in Alaska were still unsurveyed as of June 30, 1945.

LEASES AND PERMITS

During the year an additional area of 1,793,513 acres was brought under lease, including mineral permits and licenses, making a total of 17,707,440 acres under lease at the end of the year. The types of leases in force June 30, 1945 are shown by the following tables:

MINERAL LEASES, PERMITS, AND LICENSES OUTSTANDING [1]

(as of June 30, 1945)

Mineral	Leases		Permits		Licenses		Total	
	Number	Acres	Number	Acres	Number	Acres	Number	Acres
Oil and gas	6,969[2]	4,521,486	—	—	—	—	6,969	4,521,486
Coal	331	76,190	79	66,635	88	3,385	498	146,210
Phosphate	9	5,911	—	—	—	—	9	5,911
Potash	20	47,292	1	2,539	—	—	21	49,831
Silica sands	2	400	—	—	—	—	2	400
Sodium	4	1,629	34	53,224	—	—	38	54,853
Total	7,335	4,652,908	114	122,398	88	3,385	7,537	4,778,691

[1] Does not include permits granted to Federal war agencies.

[2] Does not include 25 leases within naval reserves (10,162 acres).

LEASES OTHER THAN MINERAL LEASES OUTSTANDING

(as of June 30, 1945)

Type of Lease	Number	Acres	Annual Rental
Aviation	43	28,776.27	$ 525.00
Fur farm (Alaska)	19	133,810.00	775.00
Grazing (Alaska)	9	1,168,953.93	1,269.35
Grazing (Oregon and California)	212	263,044.01	8,368.08
Grazing (Taylor Act, sec. 15)	10,584	11,310,316.49	228,254.44
Recreational	17	20,003.78	[1]610.70
Small sites (5-acre tracts)	626	3,091.32	[2]3,080.00
Water well	15	600.00	585.50
Others	3	153.01	10.00
Total	11,528	12,928,748.81	243,478.07

[1] Does not include rental of 1 lease, the rental of which is based on receipts.

[2] Does not include rental of 10 business site leases, the rentals of which are based on receipts

In addition, 393,000 acres were being used at the end of the year by Federal and local agencies, private individuals, and corporations under permit from the Commissioner of the General Land Office. War agencies held departmental permits for the use of almost 24,000,000 acres of public lands.

HOMESTEADS, SALES, AND OTHER ENTRIES

Although the total number of entries on the public lands declined again during the year, the number of new homesteads and public auction sales increased over the previous year. The number of new homesteads in Alaska totaled 117, compared with 94 in the fiscal year of 1944 and 79 in 1943.

The following table shows the new entries and selections allowed, the entries finally approved, and the patents and certifications issued during the year. At the end of the year, 4,156 entries embracing 626,000 acres were pending, awaiting further compliance with the public land laws by entrymen or final action by the General Land Office.

LAND GRANTS

Title to 73,765 acres was conveyed during the year in satisfaction of grants of public lands made by the Congress to states and railroads for public purposes. Grants to states included 43,237 acres of indemnity school land selections, 14,983 acres of park selections, 9,280 acres of swamp land, and 4,726 acres selected for miners' hospitals. A total of 1,539 acres was patented to railroad com-

ORIGINAL ENTRIES AND SELECTIONS

(Fiscal Year 1945)

Type of Entry or Selection	Original Entries and Selections[1]		Final Entries[1]		Patents and Certifications[1]	
	Number	Acres	Number	Acres	Number	Acres
Homestead entries:						
Stock raising	—	—	26	12,711.18	32	15,094.37

Grand total	274	40,265.35	746	61,357.70	1,160	216,963.10

---

[1] An original entry or selection is one made in pursuance of an act of the Congress which prescribes the terms and conditions under which patent may be issued or other evidence of title granted. An original entry becomes a final entry upon compliance by the entryman with further requirements of the law, such as residence or additional payment, and upon the issuance of a final certificate. A final certificate shows that, in the absence of irregularity, the entryman is entitled to a patent and passes equitable title to the land to the entryman. Where upon final examination it is found that an entry or selection is in proper form and that the law has been complied with, a patent conveying legal title to the claimant is issued. In the case of certain State selections, the legal title is conveyed upon approval thereof by the Secretary of the Interior and upon certification by the Commissioner of the General Land Office.

[2] Includes 3 homesteads on ceded Indian lands (433.60 acres).

[3] One selection was amended.

[4] Townlots upon which only part payment was made; area not tabulated.

[5] Includes 4 homesteads on ceded Indian lands (400.00 acres).

[6] Includes 9 homesteads on ceded Indian lands (759.94 acres).

[7] Includes 14 homesteads on ceded Indian lands (1,240.90 acres).

[8] Includes 1 homestead on ceded Indian lands (80.00 acres).

[9] Includes 3 homesteads on ceded Indian lands (280.75 acres).

[10] Includes certifications, 47,963.15 acres.

[11] Acreage previously reported.

panies pursuant to the Transportation Act of 1940. In addition, 16 patents were issued to states to give them additional evidence of title to 407,833 acres of previously granted school lands.

A total of 218 applications for rights-of-way were approved during the year under laws which provide for the granting of rights-of-way over the public lands for telephone and telegraph lines, public roads, pipelines, and other purposes. Of the applications approved, 104 were permits or easements with an annual rental of $1,730 and 32 were temporary rights-of-way over "O. and C." lands with an annual rental of $160.

LAND EXCHANGES

Exchanges of land with private owners and local governments resulted in the addition of 56,087 acres to grazing districts in exchange for 51,954 acres of Federal land; 9,037 acres to Indian reservations in exchange for 9,079 acres; 480 acres to the "O. and C." lands in exchange for an equal acreage; and 197,395 acres to national forests in exchange for 10,877 acres of land and sufficient timber to equalize the values involved.

RECEIPTS AND EXPENDITURES

Receipts from all sources during the year totaled $13,381,653. Mineral rentals, royalties, and bonuses accounted for 82 per cent of the total receipts and sales of timber from the Oregon and California and Coos Bay lands for an additional 13 per cent. The remaining 5 per cent were realized from sales of public and ceded Indian lands, rentals, fines and penalties, copying fees, and from miscellaneous sources.

DISPOSITION OF RECEIPTS OF THE GENERAL LAND OFFICE[1]

(Fiscal Year 1945)

Source of Receipts	Covered in the Treasury Earmarked For				
	General Fund	Reclamation Fund	States and Counties	Indian Trust Funds	Total
Sales of public lands	$79,582.17	[2]$100,000.00	[2]$3,800.00	—	$183,382.17
Fees and commissions	17,359.71	[2]61,000.00	—	—	78,359.71
Mineral leases and permits:					
Mineral Leasing Act	1,005,976.36	5,281,375.89	3,772,411.35	—	10,059,763.60

Taylor Act grazing leases	57,734.66	57,734.66[5]	115,469.32	—	230,938.64
Rights-of-way leases	31,977.49	444.51	—	—	32,422.00
Sales of reclamation town lots	—	7,498.64[6]	—	—	7,498.64
Sales of Indian lands	—	—	—	4,718.34	4,718.34
Copying fees	21,103.63	—	—	—	21,103.63
Miscellaneous	39,609.46	—	—	—	39,609.46
Grand total	2,420,574.49	5,918,149.04	5,032,544.78	10,384.58	13,381,652.89

[1] Before final settlement of all accounts by the General Accounting Office.

[2] Estimated.

[3] Includes $52,577.64 collected in California under act of October 2, 1917 (40 Stat. 297).

[4] Includes $23,767.94 collected in Wyoming under act of June 26, 1926 (44 Stat. 1621), $176,868.94 collected in California under Executive order 9087 dated March 5, 1942, and $15,967.22 collected in Alaska.

[5] Range improvement fund.

[6] Includes $112.50 from sale of reserved reclamation lands.

Of the total receipts, 38 per cent will be distributed among various state and county governments and 44 per cent will be covered into the Reclamation Fund. The remainder, except for $10,384.58 which will be credited to Indian trust funds and $57,734.66 which will be credited to the Range Improvement Fund, will be covered into the general fund of the Treasury.

Expenditures from appropriations amounted to $2,365,005 distributed as follows: general administration, $867,783; surveys, $517,297; field examination, $343,482; administration of the revested and reconveyed grant lands, $290,956; district land offices, $267,925; range improvements, $44,275; and fire control in Alaska, $33,287. Expenditures, aggregating $319,191, were made from funds transferred to the General Land Office for the emergency protection of public lands and for soil and moisture conservation operations. The table (p. 342) shows the receipts earned during the year, by sources and Treasury accounts.

PUBLIC UTILITIES

By H. M. Olmsted
Public Utility Engineer-Accountant

GENERAL

Cessation of hostilities in Europe and the Pacific in 1945 had large effects on public utilities, causing a sharp decline in the industrial requirements for such services, but the problem of reconversion was much less profound than in many other fields. Changes in demand showed notable variance among different classes of utilities and consumers and created problems of readjustment. Removal of war-time restrictions and return of many employees from the armed services permitted a start on rehabilitation and expansion of facilities other than for war industry. Shortages of materials, and to some extent labor troubles, caused delays and difficulties in certain directions. The startling development of atomic energy held portents for the field of heat and power but apparently in a period many years hence.

PASSING OF THE OFFICE OF WAR UTILITIES

In September, the Office of War Utilities went out of existence after four and one-quarter years during which it and its predecessors controlled the broader phases of construction and operation of electric utilities and, somewhat later, exercised corresponding control over gas, water, steam heat, and communications facilities. With the passing of OWU these controls were nearly all removed, except for control over inventories of materials and supplies, for various industries, by the War Production Board (superseded on Nov. 3 by the Civilian Production Administration), and for telephone priorities.

ANNUAL MEETING OF THE NATIONAL ASSOCIATION OF RAILROAD AND UTILITIES COMMISSIONERS

The National Association of Railroad and Utilities Commissioners, after deciding against an annual convention while the war was on, held its 57th annual meeting at Miami Beach, Florida, early in December. Emphasis was laid on the duty of state utility commissions to require that reductions in wholesale electric and gas rates, ordered by the Federal Power Commission to be made by interstate companies, be passed on by the electric and gas distributing companies to the consuming public. No further amendments to the Federal Power Act were recommended by the Association's legislative committee, although the subject was still under study. The committee on valuation reported continued investigation of the effect of the United States Supreme Court's decision in the Hope Natural Gas Co. case (THE AMERICAN YEAR BOOK for 1944, p. 318) and stated: "The cost concept is supplanting the value concept in the determination of the base figure on which the rate of return is to be calculated. . . . Continuing analysis of the rate-making elements (capital and operating costs, depreciation, revenues, profits, rates of return) and prompt action by commissions, based upon such continuing analysis and scrutiny, are taking the place of long-drawn-out proceedings and litigation in the courts."

ELECTRIC LIGHT AND POWER

The Edison Electric Institute's curve of output of electrical energy in the first seven months of 1945 closely paralleled that of the same period in 1944, at a somewhat higher level, representing in general the greatest production for any corresponding period in the history of the electric industry, although the largest output in any week of 1945 (4,614,334,000 kilowatt-hours in the week ended Jan. 13) was not quite as great as the all-time peak of 4,616,975,000 kwh in the week ended Dec. 23, 1944. Both in 1944 and 1945 the output declined from January to July; the 1944 curve rose thereafter to the high point mentioned, but in the third week of August, the 1945 curve dropped very sharply and declined still more until the end of November, being much below the 1943 and 1944 figures but above 1942. It rose somewhat in December, in which month the weekly totals ran about ten per cent below those in the preceding December.

A year-end statement by the EEI indicated that electric customers totaled some 34,000,000, having increased nearly 800,000 during 1945, and that about 150,000 farms were added to the lines of the private companies and 120,000 to lines of rural cooperatives, bringing the total of electrified farms to slightly over 3,000,000 out of 5,950,000. It gave the 1945 production of electrical energy by the entire industry, public and private, as approximately 221,000,000,000 kilowatt-hours, or 3 per cent less than the 1944 figure of 228,189,000,000 kwh. However, production of 229,328,540,000 kwh in the 12 months to July, 1945, was given as an all-time high. Gross revenue for 1945 was placed at about $3,000,000,000, much the same as 1944, while net income was estimated at $527,000,000, or 2 per cent above 1944. Construction expenditures in 1945 were reported as $225,000,000, with the prospect of double that amount in 1946.

The Office of War Utilities and its predecessors had sharply restricted increase of generating capacity in conserving it for war uses. Large concentrations of power were arranged at strategic locations, including the vast atomic energy laboratories at Oak Ridge, Tenn. (supplied by the Tennessee Valley Authority) and at Pasco, Wash. (supplied by the Bonneville-Grand Coulee system). Limited quantities of emergency capacity were also planned for. In the spring of 1945, the OWU authorized some 2,000,000 kilowatts and a substantial amount of other construction to alleviate the severe restrictions, replace worn-out equipment, and place the electric utilities in a better position to assist in industrial reconversion.

Shortly after V-J Day the OWU revoked its order that had established electric system interconnections and the standards on which electric power was to have been rationed when and if necessary. It was believed, however, that most of the interconnections ordered during the war would remain, excepting as some electric companies not under the jurisdiction of the Federal Power Commission might feel that interconnection across state lines, especially if for other than emergency use, would make them subject to FPC regulation. The FPC had granted exemptions in such instances for the war's duration plus three to six months.

FEDERAL POWER COMMISSION

Chairman Basil Manly of the FPC resigned effective Oct. 1 to become president of the Atlanta Gas Light Co., and former chairman Leland Olds became acting chairman. Manly's departure created a second vacancy on the FPC, Commissioner John Scott having resigned in June to resume law practice. President Truman appointed Harrington Wimberley, Oklahoma newspaper publisher, and Richard Sachse, former chairman (previously chief engineer) of the California Railroad Commission, to fill the unexpired terms of Commissioners Manly and Scott, respectively. Wimberley took office in October and Sachse Nov. 1. After considerable speculation concerning the chairmanship, Leland Olds was elected in December for the second time, and Nelson Lee Smith, former chairman of the New Hampshire Public Service Commission and member of the FPC since October, 1943, was made vice-chairman.

The FPC's financial report on the electric utility industry, covering 1937-1944, was issued early in December, 1945. It was based on reports from companies representing over 98 per cent of the assets, customers, and revenues of the entire privately owned portion of the industry. It showed that retirements of plant and equipment, plus adjustments of plant accounts to reflect actual legitimate investment, exceeded property additions by $90,000,000 in 1944, bringing the total plant account, undepreciated, to about $14,750,000,000. Reserves for depreciation, etc., increased in 1944 by more than $250,000,000, and the ratio of reserves to plant account increased to 19.1 per cent. The ratio of taxes to revenues was 20.3 per cent in 1944 as against 21.6 per cent in 1943. Average annual yield from bonds, based on market prices for selected utilities, was 2.96 per cent in 1944, 2.99 per cent in 1943, and 4.03 per cent in 1937. The EEI asserted that the return to investors in the industry was shown to be slightly higher in 1944 than in 1937 although the average charge for a unit of electricity was 15 per cent less, unit fuel costs were 22 per cent more, and taxes had increased 110 per cent.

A nationwide investigation of the natural gas industry by the FPC got under way in 1945, under the supervision by Commissioner Smith, with George Slaff as directing counsel. Public hearings for informative purposes were held in various parts of the country. Topics included gas reserves, production practices, extent and control of waste, state laws governing production, waste and conservation, interstate pipe lines, and utilization.

Exemption of the FPC from the Federal reorganization act, which had been contemplated during the development of that legislation, failed to materialize, although certain other quasi-judicial bodies, including the Interstate Commerce Commission, the Securities and Exchange Commission, and the Federal Communications Commission won partial exemption. Thus the FPC is in danger of losing its independence and of being placed under another agency or department, such as Commerce or Interior, some of the functions of which the FPC partially regulates, but this will not necessarily occur.

POWER "AUTHORITIES"

The Tennessee Valley Authority was reported to have produced more electrical energy in the 1945 fiscal year than any other integrated electric system in the United States. About 75 per cent was for war purposes. Electricity was distributed by 130 municipal and cooperative systems to approximately 600,000 customers. Net income was reported as nearly $18,000,000, or 27 per cent above the previous year. Two major dams—Kentucky and Fontana—were placed in operation, bringing the number of dams to 26.

At the dedication of Kentucky Dam, at Gilbertsville, Ky., in October, President Truman praised the TVA and the "authority" method of regional development, but emphasized that such development is for the people themselves to decide, and pointed out that in the Tennessee Valley state and local agencies, public and private, had joined with TVA in a two-way partnership.

The bill to establish a Missouri Valley Authority, introduced early in the year by Senator James E. Murray of Montana, pursued a leisurely course, marked by much controversy. In December the Senate Agricultural and Forestry Committee obtained an extension until March 15, 1946, for the submission of its report. Opposition included supporters of the Bureau of Reclamation (Interior Department) and privately owned utilities. Proponents claimed that, only by an overall agency covering the entire river basin, could the rivalries of public and private interests and of the Reclamation Bureau and the Army Engineers be overcome and a comprehensive and well coordinated development achieved.

A bill for creation of a Columbia River Authority, based on the Bonneville-Grand Coulee developments, was also under consideration in Congress.

Efforts were continued in 1945 by the city of Tucson, Arizona, to acquire the Tucson Gas, Electric Light & Power Co. from the Federal Light & Traction Co., which was required by the SEC to divest itself of that subsidiary. The Arizona Power Authority, created by the state legislature in 1944 to bring cheap Colorado River power to Arizona communities, sought to buy the Tucson standby plant and transmission lines serving other localities, and also the steam generating plant near Phoenix, owned by the Central Arizona Light & Power Co., together with lines emanating from it. The latter is stated to be the hub of an interconnected power system, and the Power Authority claimed that it must have this plant if it is to establish an integrated state system of power transmission.

SECURITIES AND EXCHANGE COMMISSION

The SEC dealt with many plans submitted by public utility holding companies for simplification of capital structure and limitation to integrated systems as called for by the Holding Company Act of 1935. It completed several important cases concerning such plans, including the General Gas & Electric Co., Utah Power & Light Co., Peoples Power & Light Co. and one of the three parts of a plan filed in July by the Electric Bond & Share Co., stated to involve the largest registered holding company system at present.

Chairman Ganson Purcell announced in November that sales of utility properties by holding companies as a result of the Holding Company Act had amounted to $4,347,219,587 in the period from December, 1935 to June 30, 1945; that $4,053,719,313 of this total represented properties sold to private investors and $293,500,274 represented sales to municipalities and other public bodies, the latter amount including $123,140,008 of sales to the TVA. He suggested that there would be a much stronger tendency toward public ownership except for greatly improved conditions in the electric and gas utilities resulting from Federal regulation. He pointed out that the operating companies now enjoy the benefits of cheap and ample credit, and claimed that the enforcement of the Holding Company Act had aided state utilities commissions to regulate more effectively.

On Nov. 15 the Supreme Court finally heard argument on the constitutionality of the so-called "death sentence" clause of the Holding Company Act. Four holding companies were involved in the cases that the Court took under review—the North American Co., the Engineers Public Service Co., the American Power & Light Co., and the Electric Power & Light Co. The first two had been ordered by the SEC to divest themselves of all but specified operating companies, under Section 11-b-1 of the Act, and the other two (which are parts of the Electric Bond & Share Co. system) had been ordered to dissolve, under Section 11-b-2. North American had lost a unanimous decision of the United States Circuit Court of Appeals in New York City on Jan. 13, 1943, since when its appeal had been delayed by lack of a quorum of the Supreme Court, owing to disqualification of various members who had previously represented the Government in litigation. The year ended without a decision being handed down.

An unusually large merger occurred in July when the New York Public Service Commission approved the absorption of the Brooklyn Edison Co. and the New York & Queens Electric Light & Power Co. by the Consolidated Edison Co., which thus serves four of the five boroughs of New York City with electricity, having previously served only Manhattan and the Bronx with electricity and gas. One condition of the merger was an electric rate reduction of $6,352,600 per annum; another was a reduction of over $52,000,000 in the plant account.

Public utility bond issues in 1945 reached a greater total than in any other year since 1936. There were 61 issues amounting to $1,838,509,000, according to year-end reports; this was nearly half of all bonds marketed during the year. The issues were almost all for refunding purposes. The largest financing was for the American Telephone & Telegraph Co., consisting of a $175,000,000 issue of 2¾ per cent 35-year debentures in July and $160,000,000 of similar 30-year bonds in September.

Public utility stock issues were reported as 28 in number and $120,850,000 in amount, 18 per cent more than in 1944 and nearly five times as much as in 1943.

Interest rates remained low. The $175,000,000 A. T. & T. Co. 2¾ per cent debenture issue in July was sold at 99.5599 to a banking syndicate which offered it to the public at par. In December a $75,000,000 issue of 2¾ per cent debentures of the Pacific Telephone & Telegraph Co. sold to bankers at 102.15, and $56,929,000 of 2¾ per cent first mortgage bonds of the Buffalo Niagara Electric Corp. brought 101.679. Thus the yields on these two large issues were less than 2¾ per cent.

GAS

Revenues of the gas utility industry in 1945 were reported by the American Gas Association as approximately $1,141,374,000, an increase of 3 per cent over the preceding year. Residential sales were stated to have risen 6 per cent over 1944, and industrial sales to have declined 4 per cent. In the latter part of the year industrial sales were about 10 per cent and total sales about 2 per cent less than a year ago. Natural gas revenues were given as $692,526,000 and revenue from manufactured and mixed gas as $448,848,000. Total customers increased 1.9 per cent during the year, to about 20,156,000. Total gas sales of 2,640,264,000,000 cubic feet in 1945 were stated to be the largest in the history of the industry.

Large rate reductions and refunds by natural gas companies were made in 1945. On Oct. 1, the Colorado Interstate Gas Co. filed a schedule with the FPC reducing interstate wholesale natural gas rates by $2,793,000 per annum; they were retroactive to May 20, 1942, owing to an FPC order of that period which was upheld by the Supreme Court on April 2, 1945. A refund of more than $8,500,000 was required. Another FPC order, affecting the Panhandle Eastern Pipe Line Co., was also upheld on April 2; reduced rates retroactive to Nov. 1, 1942 involved a refund of over $24,000,000 to customers in Michigan, Ohio, Indiana, Illinois, Missouri, Kansas, and Texas and an annual reduction of nearly $9,500,000, based on 1944 billing.

The question of electric and gas service both being furnished by a single company or affiliated companies came to the fore with a decision of the SEC on April 7 requiring the Union Electric Co., of Missouri to divest itself of the St. Louis County Gas Co. because of advantages of independent over combined ownership and operation of electric and gas utilities, as found by a study. This was followed on May 9 by a refusal of the New York Public Service Commission to permit acquisition of the Rockland Gas Co. by the Rockland Light & Power Co., on the score that the public interest would be better served by preserving independence of the gas and electric utilities of the area involved.

FEDERAL COMMUNICATIONS COMMISSION

The FCC announced on Nov. 30 that, following negotiations with the American Telephone & Telegraph Co., additional reductions in interstate telephone rates, estimated to save users over $20,000,000 a year, would become effective Feb. 1, 1946. The reductions affect toll rates for distances between 340 and 2,140 miles and also certain others under 40 miles. The Commission stated that in considering these reductions it was mindful of the tremendous post-war program facing the Bell Telephone System, including restoration of plant, expansion of rural service and the overall improvement and extension of service in line with developments in the art. This program, stated to call for some $2,000,000,000 of additional money, is expected to aid materially in the nation's reemployment and reconversion program.

LABOR RELATIONS

While the war was in progress, strikes of utility employees were negligible. Following V-J Day, much labor unrest developed, with demands for pay increases, some of which were adjusted only after strikes. One electrical strike was a four-day walkout of 22 locals of the Michigan Utility Workers Council (CIO) in plants of the Consumers Power Co.; it ended Oct. 22, after the intervention of Governor Harry F. Kelly, with a 13¢ hourly increase as against the union demand of 30¢ and the company offer of 10¢. Opportunity was left for future adjustments in line with changes in the national wage situation.

In Texas the Lower Colorado River Authority experienced a strike of part of its operating department employees in October which cut off electric service of a large area in the central part of the state. The strike was to force recognition of the International Brotherhood of Electrical Workers (AFL) as bargaining agent, but the LCRA maintained that, as a state agency, it could not make an exclusive labor contract, and dismissed the strikers.

Local transportation in New York City suffered a war-time "slowdown" for five days in June on the lines of the New York City Omnibus Corporation in a protest by the Transport Workers Union (CIO) against the company's slowness in meeting demands for higher wages and improved working conditions. Mayor LaGuardia denounced the slowdown technique as dishonest and a menace to the good standing of organized labor. Similar tactics were, however, employed in October on the lines of the affiliated Fifth Avenue Coach Co.

Several strikes occurred late in the year on various bus lines in New York City, including the Staten Island Coach Co. and the Green Bus Lines, Inc. (Borough of Queens) with brief sympathetic work stoppage on other Queens lines under the guise of sickness. The Amalgamated Association of Street, Electric Railway, and Motor Coach Employees (AFL) was involved. A strike of the same union on lines of the Eastern Massachusetts Street Railway Co. affected street cars and buses in 70 towns and cities for three days in October and resulted in temporary seizure of the company's facilities by the state of Massachusetts. It was settled by bonus payments of nearly $500,000 to some 1,900 employees, in lieu of wage increases.

The Amalgamated also went on strike in Washington, D. C., Nov. 6 on the street-car and bus lines of the Capitol Transit Co. but went back to work the following day for a 14-day truce pending negotiation of demands for an hourly increase of 30¢. On Nov. 21 another walkout occurred, despite pleas of union officials to submit the demands to arbitration. The contract had not expired. The strike ended after President Truman had called the action "a blow at the sanctity of labor agreements" and ordered the Office of Defense Transportation to take over the operation of the lines.

TELEGRAPH AND TELEPHONE STRIKE THREATS

At the end of the year employees of the Western Union Telegraph Co. in the metropolitan New York district who belonged to the American Communications Association (CIO), threatened to strike as a result of a decision of the National War Labor Board announced on Dec. 31, alleged to represent a reduction of wage increases previously granted by a regional board, while revising upward an earlier award of the national board for the Commercial Telegraphers Union (AFL) operating in other parts of the country. The strike took place in mid-January, 1946 and continued for several weeks.

Another year-end strike threat, of possibly national proportions, lay in the efforts of the Western Electric Employees Association to cause a sympathy walkout by the affiliated National Federation of Telephone Workers (independent), which could tie up long-distance service on the Bell system. The WEEA demanded a 30¢ hourly wage increase, as against a company offer of 15¢.

For six days in November nearly 9,000 long-distance operators, members of the Illinois Telephone Traffic Union, employed by the Illinois Bell Telephone Co. outside of Chicago, were on strike because of a WLB award of a $4 weekly increase instead of $6 as demanded. A nationwide strike of the NFTW was threatened on Nov. 24, but on that day the walkout ended with an agreement between company and union officials to make the additional $2 increase effective by February 1, 1946, and to discuss further post-war increases.

These labor troubles, though involving but a minor part of total utility operations, emphasized the special problem of determining fair compensation for labor in public service industries subject to price regulation without coercion on either side, and without depriving the public of essential services.

ATOMIC ENERGY

The vast wartime development of atomic energy for terrific destruction has excited much discussion of its possibilities for constructive power generation. Extravagant prophecies have been made, but no practical application in this field seems probable for years to come, and then in special circumstances, according to the present outlook. The scarcity of uranium, the tremendous installations and techniques for its utilization, and the necessity of great protective measures and strict governmental control are obstacles against such use; and the cost of coal or of water power is such a minor element—less than one mill per kilowatt-hour in some modern steam plants—in the total cost of delivered energy, that existing steam and hydro plants seem likely to live out a normal life without great danger from "atomic" competition.

WATER SUPPLY

By E. Sherman Chase
Metcalf & Eddy, Boston

GENERAL

The end of hostilities in Europe and in the Pacific had little effect upon the water supply industry of the United States. Continued shortages in labor and materials, even with the termination of warfare, retarded the consummation of post-war projects for water works betterments. A few notable exceptions occurred, and a few projects allied with the war effort were carried out. The technical press published numerous papers dealing with water works subjects but, on the whole, no startling development occurred.

Unlike the newer fields of technology, the art and science of water supply engineering seldom shows spectacular progress. Only four major developments in the water works field have occurred during the past century and a half. These developments were (a) metal pressure pipes, (b) power-operated pumps, (c) water filters, and (d) chlorine technique for disinfection.

COMPLETED PROJECTS—CHICAGO

At Chicago the partially completed filter plant was put into operation in 1945. Construction of this plant, started prior to the war, was greatly delayed because of restricted supplies of labor, materials, and equipment. Only the preliminary treatment features of the plant were sufficiently finished to permit their use when the plant was started. The treatment afforded consisted of pre-chlorination, coagulation, clarification, and post-chlorination pending the completion of the filters. The plant will have eventually a capacity for purifying 500,000,000 gallons of water daily and will thus be the largest water purification plant in the world. The plant supplies about 54 per cent of Chicago's population, and when finished will have cost about $24,000,000.

The water works of North Chicago, a suburb of Chicago, were increased in capacity from 2,400,000 gallons per day to 4,500,000 gallons by the construction of a second intake from Lake Michigan, additional filters, and accessories. In 1901, North Chicago had only 250 voters, and its water works had a capacity of 100,000 gallons daily.

PHILADELPHIA

Philadelphia began a program of water supply improvement. The supply of this city is derived after filtration from the Schuylkill and Delaware rivers. Increasing pollution of the river sources, deterioration of pumping and filtration facilities, and inadequacy of pipe lines have necessitated major betterments in all these particular parts of the system. Although the whole program is far from completed, approximately $4,000,000 has been spent. The total eventual expenditure is estimated at about $30,000,000.

MOBILE

In the South, Mobile, Alabama, completed a 20,000,000-gallon per day filter plant near the end of 1944. This plant was required because of increasing pollution of the sources of supply and the increasing population of the city with corresponding increases in demands. The cost of the filter plant, raw water reservoir and new mains was approximately $2,250,000.

SAN DIEGO

Across the country at San Diego, Calif., the construction of a 50,000,000-gallon daily aqueduct, some 71 miles long, was started the latter part of 1945. The increase in population, together with the requirements of the expanded naval and industrial establishments at San Diego, placed an unprecedented demand on the nearby water sources. This new aqueduct, to be constructed under the auspices of the Navy, will tap the aqueduct of the Metropolitan District of southern California and will convey Colorado River water to the recently completed San Vincento impounding reservoir of San Diego. This reservoir is located about 20 miles from the city.

The principal items of this project will include a 1,400 acre-ft. regulating reservoir near the Metropolitan District's aqueduct; seven concrete lined, horse-shoe shaped tunnels (6 ft. x 6 ft.), having a total length of 4.3 miles; 1.8 miles of high head 48-inch steel pipe across river valleys; two miles of 96-inch 12.2 miles of 72-inch, 21.9 miles of 54-inch, and 28.2 miles of 48-inch reinforced concrete pipe. It is expected that delivery of Colorado River water will begin in the summer of 1947. The total estimated cost is $17,500,000.

In addition to the navy-sponsored aqueduct the city will construct a new pipe line from the San Vincento reservoir, a modern 60,000,000-gallon daily water treatment plant, and a 20,000,000-gallon regulating reservoir. The cost of these improvements is expected to be about $6,000,000.

SOURCES OF SUPPLY

During the year, the Committee on Rainfall and Yield of Watersheds of the New England Water Works Association published valuable reports upon rainfall and yield in New England.

A noteworthy paper upon the maintenance and operation of a large watershed by Wendell La Due, vice president of the American Water Works Association, was published during the year. In this paper, La Due describes the measures taken to administer several thousand acres of drainage area tributary to the impounding reservoir of the water supply of Akron, O. Fruit orchards and vineyards were laid out on part of the area, and as high as 25,000 bushels of apples have been harvested in a year and several hundred tons of grapes. Originally a city-operated project, the orchards and vineyards are now rented to a horticulturist under a rigid contract.

In addition to the orchards, the city has put into effect an extensive program of reforestation, largely of evergreens. Since 1922, over 600,000 trees have been planted at an average cost of $35 per 1,000. Other activities involve the operation of a maple sugar "bush" which produces 300 to 650 gallons of sirup per year. Sheep and cattle are also raised upon certain portions of the area.

WATER SUPPLIES DURING THE WAR

War conditions both at the front and in the cities with war industries resulted in a multitude of special problems. The necessity for expansion of water facilities in municipalities affected by the war boom has already been referred to.

At Detroit excessively high peak daytime demands, necessitated the use of a former raw water reservoir, 40,000,000 gallons capacity, for storing water filtered during the night for delivery during the day. At Louisville, the increased demand for cold water for cooling purposes at alcohol distilleries so depleted the ground water sources used for this purpose that filtered river water from the city's supply was used directly in the colder months. Cold city water was also used to recharge the ground water sources. At Columbus and Lima, O., extreme demands and drought conditions seriously impaired the adequacy of the normal public supplies, and recourse was had to emergency supplies from ponds, abandoned stone quarries, and other sources. At Columbus, the filter wash water was conserved by pumping back through the plant.

Early in the war a threatened water shortage at Naugatuck, Conn., owing to extraordinary demands by war industries, was averted by installation of meters on practically all services. Metering is estimated to have brought about a 60 per cent reduction in domestic water consumption, thus making available an additional amount of water for the war industries.

Increased army and naval needs at certain islands off Portland, Me., also early in the war, resulted in the laying of several thousand feet of submarine water mains under difficult conditions. It is believed that portions of the mains were laid at greater depths than mains had ever before been placed in trench excavated under water.

WATER SUPPLIES IN THE WAR AREAS

In the war areas, the problems related to water supply were varied and difficult. For shore assaults water was carried in five-gallon multi-purpose cans. In areas behind the front 35-gallon Lyster bags were used with ampoules of chlor-dechlor for sterilization. For turbid waters, a hand kit was developed consisting of a wood pulp and asbestos filter capable of filtering two gallons per minute. For combat troops a supply of one gallon per capita per day was the goal and for troops at bases, 15 to 20 gallons. At rear areas, portable water purification units were used consisting of a pump, coagulation and settling tank, pressure filter, chlorinator and storage tank. In the Pacific area on small islands and atolls, distilling equipment for salt water was used.

On Guam, prior to the war, the water system consisted of half a dozen spring-fed reservoirs on the hills and cast-iron transmission mains. The reservoirs and mains were badly damaged by our forces during the fighting. The Seabees took over the task of repairing reservoirs, mains, and pumping stations, and within two months after the first assault wave the major part of the water utility of the island was functioning. Later the Seabees constructed a large tunnel to collect fresh ground water.

CROSS-CONNECTIONS

Another water works problem of long-standing but one emphasized by the war, was that relating to cross-connections between potable supplies and unsafe supplies. A number of instances occurred where cross-connections at pier heads between fire systems on ships and the potable water supply system at the dock resulted in the pollution of the potable supply and in several cases water-borne outbreaks of disease followed. A special committee under the auspices of the Office of Scientific Research and Development made a study of the problem and presented a report upon the subject. This report gave four methods for prevention of backflow of polluted water into systems of potable water, namely (1) physical separation with air gap, (2) vacuum breakers, (3) backflow preventer with positive pressure relief, (4) double check valves on six-inch or larger lines. Complete separation is the desirable goal but impossible of immediate achievement.

During the year, the American Water Works and Electric Company adopted new rules and regulations relative to cross-connections. These are given in an article by John H. Murdock, Jr., counsel for the company, published in the May, 1945 issue of the *Journal of the American Water Works Association.* The object of these rules is to bring about the elimination of all cross-connections between the water supplies controlled by this company and unapproved sources.

A particularly vigorous campaign has been waged for some years in Los Angeles to eliminate or control cross-connections. In addition to the more common type of double check valve (Factory Mutual), certain manufacturing companies have developed checks with positive preventive devices which preclude backflow.

With the nearly complete abolition of major water-borne outbreaks of disease resulting from contaminated water supplies, more and more attention is being and will be paid to the prevention of localized contamination within distribution systems. Such contamination may result from cross-connections with polluted supplies as previously discussed or through backflow from faulty plumbing fixtures.

CHLORINATION

Continued research was carried on and experience extended during 1945 in connection with chlorination of water. Further information was gained as regards the use of chlorine dioxide. Experience with this chemical was both favorable and unfavorable. From the Division of Laboratories and Research of the New York State Department of Health came an improved method for determining true, false, and chloramine residuals.

McCarthy, of the Lawrence Experiment Station of the Massachusetts State Department of Public Health, reported on further research upon the use of chlorine dioxide for the disinfection of water (*Jour. New Eng. W. W. Assoc.*, V. 59, p. 252). He concluded that chlorine dioxide treatment can result in satisfactory removal of tastes and odors and should have a beneficial effect on distribution systems by preventing pipe slimes. He pointed out that chlorine disinfection must be separated from odor control and should be completed before the application of chlorine dioxide, otherwise high residuals would be needed. Water treated with chlorine dioxide will carry high chlorine residuals without taste. Operating costs with chlorine dioxide appear to be somewhat higher than with superchlorination and somewhat less than with activated carbon.

CORROSION CONTROL

Cathodic protection of steel standpipes against corrosion of interior surfaces continued to receive attention from water works men and new installations were made.

The effectiveness of chemical treatment of water supplies to reduce their corrosive effect upon metal pipes underwent further study. An exhaustive investigation of corrosion control in potable water systems at military posts was reported upon by Major Rolf Eliassen (*Water Works and Sewerage*—vol. 92, p. 187). Eliassen concluded that the method showing the greatest promise at present was the feeding of small quantities of chemicals which form films of protective coatings on metallic surfaces. These chemicals vary in character, and some of the polyphosphates are useful as well as the earlier used chemicals such as lime, soda ash, and sodium silicate.

REHABILITATION OF MAINS

One of the effects of the corrosive action of water is the rusting and tuberculation of water mains. In recent years, more and more water utilities have undertaken the cleaning of mains and the lining of them in place with cement mortar.

For smaller mains, the Tate process has been adopted at numerous places. At Charleston, S. C., several thousand feet of mains have been cleaned and lined, with materially beneficial results. Particularly important was the restoration of the carrying capacity of old pipes.

For lining large diameter mains another method is employed. Cleaning is done in the usual way after which cement mortar is applied by a special machine developed by the Centriline Corporation. This process may be described in simple terms as "buttering" the mortar to the walls of the pipe as compared to "squeezing" in the case of the Tate method.

At Wichita, Kan., several thousand feet of 42-inch and 48-inch cement-lined cast iron pipe, whose carrying capacity had been materially reduced by growths of slime, were cleaned during 1945. As a result of these operations, the capacity of the pipeline was increased about 50 per cent. Previous to the cleaning operation, heavy applications of chlorine were tried, and, while helpful, were too slow in improving pipe capacity.

LEGAL PRONOUNCEMENTS

On May 9, 1945, the Public Service Commission of Wisconsin rendered a decision in a rate action brought by the municipal water department of Menasha. This decision is noteworthy in that it: (1) predicated a 5 per cent return on city property as part of the earnings, (2) ruled that a rate structure should be based upon capacity cost of the plant required to provide each class of service and not upon average cost of furnishing water, (3) refused the water utility permission to adjust its rate schedule by reducing the charge for public fire protection and increasing the rate to industrial consumers, (4) continued the policy of requiring an adequate charge for private fire protection service.

In June 1945, the Supreme Court of Ohio rendered a decision to the effect that the real and personal property of the City of Cleveland, Division of Municipal Transportation, was not exempt from taxation. As a consequence of this decision, Ohio County auditors have been requested to appraise and place upon the tax duplicate the property of the various municipally-owned and operated water systems.

EMERGENCIES

Early in 1945, an ice jam and flood conditions in the Susquehanna River caused the flooding of pumps and filters of the water company's plant at Columbia, Penn. This condition resulted in the nearly complete cessation of normal activities in the community until emergency pumps and purification equipment could be installed. This incident illustrates the indispensable part played by water supply in the modern world.

On July 28, 1945, a ten-ton army B-25 bomber crashed into the Empire State Building 915 feet above street level. Although falling fragments of the plane ruptured an eight-inch water main riser, the use of other risers and temporary repairs to the injured main permitted the firemen to put under control in less than 40 minutes the fierce fire caused by the crash.

MISCELLANEOUS

The application of electronic equipment to water works operation is a relatively new development. Such application relates to the measurement and control of pH of treated waters, to the transmission of flow measurements and water levels, and to analytical devices. The possible use of electronic impulses and vibrations for flocculation and for sterilization have been suggested.

The subject of application of sodium fluoride in minute quantities to public water supplies as a means of combating dental caries in children continued to receive much attention during the year. Grand Rapids, Mich., is one of the few municipalities where this measure has been put into effect.

Some water supply reservoirs have suffered infestations by such pests as midge fly larvae and crustacea. To combat midge fly larvae, DDT was added to the water in two clear-water reservoirs of the Alexandria Water Company at Alexandria, Va. in August 1945. The dose employed was 0.01 part per 1,000,000 and was applied uniformly over the surface of the reservoirs. Three days after the application, the larvae disappeared. This use of DDT raises numerous questions as to the problems which may result if this material is used in public water supply reservoirs. Research is needed to provide the answers.

While profit sharing in industrial establishments is not new, employee profit sharing in a municipally-owned and operated utility is new. At Waukesha, Wis. the Water Utility Commission has put into effect a Salary Savings Plan for employees. Such employees are not covered by Federal Social Security, and the Waukesha plan was devised to provide equivalent protection. This plan consists of a systematic purchase of retirement annuity insurance with the Utility Commission contributing two dollars for every dollar contributed by employees.

The Committee on Survival and Retirement Experience with Water Works Facilities began the publication, in the *Journal of the American Water Works Association,* of a mass of data relating to the actual life and mortality experience of water works property in many cities. These data will be of great value in all matters relating to the financial aspects of water works operation.

STREET AND HIGHWAY TRAFFIC

By Ernest P. Goodrich
Consulting Engineer, New York

GENERAL

An experienced estimator believed that passenger car registration totals on Dec. 31, 1945 would be approximately 25,100,000 and motor truck registrations 4,550,000, or a combined total of 29,650,000. Increase in intercity automotive traffic during the first year after the war will amount to 38 per cent over the 1935-39 average and 6 per cent in excess of such travel in 1941, according to estimates reported by the Bureau of Transport Economics and Statistics of the Interstate Commerce Commission.

VEHICLE CONDITION AND USE

One car in seven on the highways had poor brakes, brakes that probably could not stop a car in an emergency. This was the average shown by checks on 1,806,145 cars in the United States and Canada during the six weeks of the brake-check program sponsored by the International Association of Chiefs of Police. More than 5,000 police chiefs and sheriffs directed tens of thousand of traffic officers who applied the brake check. Of nearly 2,000,000 cars checked, 263,441, or 14.6 per cent, could not meet one simple requirement; they failed to take hold before the brake pedal came within an inch of the floorboard.

It was estimated that travel in private automobiles totaled 275,000,000,000 passenger miles, compared to 96,000,000,000 miles by steam railroads, 57,924,000,000 miles by motor buses, 36,400,000,000 miles by electric railways, 28,267,000,000 miles by Pullman cars, and 2,230,000,000 miles by domestic airlines.

Gasoline rationing and the Federal speed limit of 35 miles per hour were lifted in the late summer. Conservation as a patriotic duty largely lost its appeal.

Drivers of the nation were warned that neither they nor their cars were in shape to indulge in a post-war speed spree without piling up the biggest traffic toll in the country's history. The warning came from a joint committee on post-war speed control that represented 14 national organizations, officials, and others interested in traffic safety.

The average age of passenger cars was found to be more than eight years, as compared with an average of four and one-half years in 1940. Both drivers and pedestrians have become accustomed to top rural speeds of 35 or 40 rather than 50 or 60.

ACCIDENTS

In comparison with 1944 a disheartening increase took place in traffic accidents and deaths. The latter have been estimated at 41,250 for the full year of 1945. A sudden return to pre-war speeds produced an accident toll during the last five months of the year far greater than the pre-war peak of 40,000 deaths and 1,400,000 injuries in a single year. There were 2,520 pedestrian deaths during the first quarter of the year, which paralleled the pattern for 1944. In May traffic deaths increased two per cent but went down three per cent for the first five months of the year. In the first four months of the year travel was up six per cent.

Seventeen of 40 reporting states had cut their traffic death toll in May; 19 had increases and four had no change from May 1944. Twenty-one states reported decreases, 17 reported increases, and two reported no change for the five-month period in 1945 as compared with 1944.

Pedestrian accident locations in Wilmington, Del. were stencil marked on the streets and brought up to date weekly. A white circle with the letter "P" designated a pedestrian injury. A 24-inch yellow circle with a cross in the center indicated a fatal accident involving either a pedestrian or motorist. These methods proved valuable in helping to educate Wilmington drivers and pedestrians to safer practices.

PARKING

Four hundred and forty-nine cities throughout the country have installed parking meters, which have assisted materially in solving major parking problems.

A Circuit Court of Oregon held that Portland's parking meter ordinance was a valid police power regulation. Out of $1,121,865.16 collected from parking meters, $193,266.78 was spent on the installation and upkeep of the devices, with the balance of $928,598.38 expended for general traffic purposes.

Burlinghame, Calif. planned publicly owned and operated parking areas in the city's congested areas to remedy problems of heavy traffic flow, relatively narrow streets, and limited parking space. The project was to be financed, at least in part, by creating an assessment district within the commercial zone, property owners within the district assuming the cost of improvements.

Lewiston, Me. purchased a 250-square foot lot in the business district to use as a city-owned off-street parking lot. About $2,000 was spent to make the lot usable. Parking is limited to three hours and is free of charge.

A planning consultant was hired by

Berkeley, Calif. to assist in preparing a plan for the development of adequate off-street parking facilities adjacent to the commercial center of the city and at the same time develop a master street and highway plan, and park and recreational plans.

Underground parking has been tried in a few instances. Notable among them is the four-level garage under Union Square Park in San Francisco. Built at a cost of $1,500,000, it accommodates 1,700 automobiles. Charges are 25 cents an hour, 75 cents overnight, and $12.50 per month.

TREND OF UNDERGROUND PARKING AND GARAGING

A survey of traffic conditions in 24 of the nation's largest cities conducted by the Commerce & Industry Association of New York revealed that the trend in parking was underground. A considerable number of them provided underground off-street parking facilities. It was also revealed that opinion is equally divided on the use of parking meters and that a majority of them have established some form of municipal control to coordinate the activities of various city departments as to traffic matters.

Detroit voted by referendum to construct a 1,000 car garage beneath a city street to be municipally operated. The construction of a 2,700 car garage underneath a park was considered by Los Angeles. Cleveland permits the parking of 700 cars in an underground exhibition hall when the place is not otherwise occupied. Every city surveyed, with the exception of Memphis, admitted serious traffic problems. Twelve cities reported that they maintain some kind of municipal traffic control commission.

CENTRAL PARKING PLAZA AT HARTFORD

A super parking plaza was recommended for Hartford as a means to help stabilize central real estate values and add to the attractiveness of the city's shopping and business area. Three inclosed floors and a roof would care for 2,500 cars at one time, and could be extended for a total of 3,300. Up to 10,000 cars a day could be taken care of. Small, lightweight deluxe trains with electric battery motors were considered the most logical means of getting the public to and from central places of business. An attendant could take a patron's car at each motor entrance and deliver it at an exit. Cashiers located there would eliminate the dangers of having the patron walking about the parking area. Connections to the horizontal walk and tramway were to be provided by escalators to all floor levels above the ground floor. At street level a main waiting room was proposed with rest rooms and concessions.

TRAFFIC PLANS

A comprehensive traffic report was submitted to the city of Salem, Ore. A plan was suggested whereby main arteries linking the downtown section with residential areas would form a pattern similar to the spokes of a wheel. With Salem's wide streets, it was pointed out that parking along principal streets should be controlled or prohibited, permitting at least four moving traffic lanes. The elimination of angle parking was also recommended.

Cities from 25,000 to 50,000 population should have a full-time equivalent of at least four traffic officers for each 10,000 population, according to National Safety Council studies. A strong plea for off-street parking facilities was made. Merchants and businessmen were called upon to recognize the importance of adequate parking facilities.

SAFETY MEASURES

A serious pedestrian accident situation was solved in San Diego, Calif. by forcing employees to use concrete pedestrian overpasses at three large airplane plants. After considerable education of workers through plant loudspeaker systems, repainting of all signs and crosswalks and direction signs to the overpasses, an ordinance was adopted by the City Council making it unlawful to cross this roadway at other than a crosswalk or overpass.

Off-street bus loading and unloading lanes proved valuable at the entrance to the United States Signal Corps, Arlington Hall installation outside of Washington. Turnouts were constructed by Arlington County and fences were erected to keep crossings to the marked crosswalk. For night guidance, a controlled signal and a 100-lumen sodium vapor lamp were placed.

It was estimated that traffic snarls, particularly in mid-town Manhattan, were costing merchants and trucking concerns more than $1,000,000 a day. Fines for illegal parking were levied in an effort to remedy the situation. Parking on many streets was prohibited or strictly regulated.

A modern fully flexible traffic control system was installed on one avenue in Detroit which averages 40,000 vehicles a day, with 2,000 in one direction at peak hours. General Electric multi-dial secondary controllers were used at 18 intersections. These controllers have two dials for changing the percentage division as traffic varies at each intersection—when traffic volume increases on one street or when an exclusive pedestrian interval is needed, or when it is advisable to provide more pedestrian "go" time on that street. Intersections where frequent changes in traffic volume occur can be studied to determine the regularity and frequency of such changes. The required time cycle splits on the dial can be pre-set. The change from one dial to another is accomplished electrically and can be done with a manual switch but is usually automatically taken care of by time switches or a program controller. The remote cycle change feature allows three different system-time cycle lengths. A special G-E program device permits automatic use of any combination of these features which can be set up for different combinations each day of the week for 12 weeks in advance. Changes can be set to occur at 12-minute intervals. All controllers are connected to a centrally located master controller. Multi-dial controllers are also useful for fluctuations in pedestrian volume as at school crossings. The "walk" cycle can be lengthened or shortened according to pedestrian traffic in the same manner as for car control.

Safety experts, businessmen, employers, and thousands of passengers lauded Milwaukee's mid-block bus stop plan on the city's main business thoroughfare. It has successfully survived two years' tests. Under this plan, bus riders board and leave buses at mid-block curb stops with more convenience and safety than at congested intersections. All other vehicular traffic on the street was expedited. Travel time for users of both buses and street cars was reduced. The number of downtown accidents decreased because the new system reduced congestion at street corners. Inquiries from various parts of the country indicate that many larger cities may follow Milwaukee's example.

STREETS AND HIGHWAYS

In December 1944, Congress passed the Federal-aid Highway Act, which amended the Federal law so as to recognize the needs of urban highway development. The law makes Federal-aid funds available for projects in urban areas, and authorizes the designation of a National System of Interstate Highways which will be a network of limited mileage connected and penetrating the major centers of population. These far-reaching changes in national policy were the result of ten years of research carried on through the state highway planning surveys.

Late in 1943 the Traffic and Operations Department of the Highway Research Board appointed a project committee to study origin and destination survey techniques. Their 1945 report briefly reviews the various methods used, and describes in some detail the results obtained.

Enough study has been made to show beyond doubt that data collected in good origin and destination studies are necessary not only in locating and designing new facilities properly but also in providing more efficient use of existing street and parking facilities.

Studies by the District of Columbia Department of Vehicles and Traffic indicate that the use of Washington's major streets, especially in the downtown section, reached the saturation point just prior to the war. Careful analysis of the various factors involved lead to the estimate that within five years traffic will have again reached that peak. The Department therefore prepared and submitted to the Board of Commissioners a program for expanding and perfecting the traffic control system, to be completed within that five-year period.

One of the most important steps provided for installing additional signal faces at each controlled intersection so that there will be a signal on the far left corner as well as the present signal on the far right corner. Thus if one signal is hidden by a large truck or bus, a driver would still be able to see the other signal. Moreover, a pedestrian will always have a signal directly in front of him. In many ways this is of the greatest advantage since it now is frequently difficult for a pedestrian to determine when it is proper to cross.

Another important item intended primarily to aid the movement of traffic in the congested district recommends installation of a central control signal system to vary cycles and coordinate synchronization of lights to meet varying conditions at given points.

It was proposed to replace or renew all present regulatory, warning, or directional signs and route markers with durable attractive signs on metal posts. Neon "one-way" signs, having proven very effective in directing traffic on streets which are restricted in rush periods, it is proposed to install them on all streets where the part-time one-way restriction applies. Pedestrian barricades, used to prevent pedestrians from crossing the streets at off-set intersections or other hazardous locations, were found very effective.

TRAFFIC DEVELOPMENTS IN CHICAGO

The former Lincoln Park area in Chicago, cut up by the many winding drives into small areas of little recreational use is a thing of the past. Every available space has been made usable by the elimination of many of the drives that formerly traversed these areas. At the same time, the new roadways thus provided are so planned and constructed that two types of drives are obtained: one type for the through traffic motorist whose main interest is a convenient and ready passage through the Park, and the other type for the pleasure and recreation seeker whose main interest is in the Park's many recreational facilities and attractions.

The new express drive utilizes the greater part of the area formerly traversed by Beach Drive and runs parallel and close to the shore of Lake Michigan. The roadway is 100 feet wide, of a nearly straight alignment, no curves having a radius less than 4,000 feet, and with all access and egress points at grade separations. The drive is composed of eight wide traffic lanes that may be divided into four separate roadways of two lanes each by means of capacity-providing divisional fins. Without the use of this remarkable invention, a roadway of 170-foot width would have been necessary to accommodate the known traffic volume. With its use, a roadway of 100-foot width was constructed which amply provides for the heavy traffic volumes carried. The result in savings is tremendous, considering what the estimated costs would have been had the 170-foot-wide roadway been constructed. Such items as increased right-of-way, paving, more extensive overpasses, bridges, light maintenance, cleaning, etc., would have made the cost of construction almost prohibitive, yet the added cost of the capacity-providing fins was barely one-half of this cost by comparison.

The capacity-providing divisional devices consist of three parallel lines f fins running longitudinally in the oadway and arranged so that by the aising and lowering of each parallel ow, the roadway may be separated nto many combinations, according to raffic requirements.

Each line of fin consists of a series f movable units, each unit of which s made up of a structural steel box pproximately 20 inches wide, 16 nches deep, and 25 feet long. This is laced in a trench so that in the lowred position its top is flush with the djacent roadway surface. By means f hydraulic jacks, these fins are raised ight inches above the roadway surace, thus producing a continuous barier between the traffic lanes. Since he jacks are of the double acting ype, the fins may be raised or lowred as desired.

When traffic is directed to the Centeral Business District, the east line of ns is raised, thereby separating the oadway into six lanes for southbound raffic and two lanes for northbound raffic. In the evening rush period, when the prevailing traffic is directed way from the Central Business Distict, the west line of fins is raised hereby, separating the roadway into ix lanes for northbound traffic and wo lanes for southbound traffic. Beore and after the morning and eveing rush periods, termed the normal eriod owing to the even balance of ows, the center line of fins is raised o separate the roadway into equal arts. The raising and lowering of he fins is controlled by the operation f switches from control boxes located t the two extremities of the system.

Each parallel line of fins is broken own into divisions, each division beg provided with sump tanks, a umping station, and the hydraulic ping to the jacks for the fins in its vision. Each division is also conected to the adjacent division by a ystem of electrical controls, similar n principle to a progressively operted stop-and-go light system for connuity of control and operation. All n units in each division rise simulaneously in approximately 30 seconds.

TRUCK TERMINALS

The Port of New York Authority sold $7,500,000 worth of bonds to provide funds for the construction of the Authority's proposed Manhattan and Newark Union Motor Truck Terminals. Construction of the terminals is scheduled for completion by January 1947.

The Manhattan Motor Truck Terminal to be built at a cost of $4,850,000 will be 1,000 feet long and 175 feet wide, with a daily capacity of 2,000 tons. In Newark, the 2,500-ton truck freight station will cost $2,650,000 and will be 1,100 feet long and 200 feet wide. The difference in the cost of the two terminals, which are almost identical in size and design, results from the necessity of providing parking space on the roof of the Manhattan terminal for loaded trucks and trailers. This type of roof construction is necessarily costly.

SIGNS, SIGNALS, AND MARKINGS

The American Association of State Highway Officials prepared a set of design standards for use on the national system of interstate highways which will include heavily traveled routes in all sections of the country and, for the first time, extended into and through urban areas, permitting the expenditure of Federal funds for the relief of city street congestion. These standards are made in terms of peak-hour traffic determined as a basis for design and to accommodate the thirtieth highest hourly traffic density of the year.

The system provides for a mixed traffic of passenger automobiles, motor buses and motor trucks, and tractor-trailer and semi-trailer combinations of a volume of each of the constituent elements estimated to be that which will exist 20 years from the date of construction.

Where state laws permit, control of access is to be obtained on all new locations and on all old locations wherever economically possible. Where railway operation involves two or more mainline tracks, separation should be provided regardless of traffic volumes on the interstate highway.

Where the railway operates six or more regular train movements per day on a single track, separation of grades may be justified regardless of traffic volumes on the interstate highway.

For a design traffic density of 3,000 or more on an interstate highway, every effort shall be made to eliminate all cross traffic at grade. Where cross traffic at grade is not eliminated, traffic signal control installations, channelized intersections, or stop control on the crossroads are to be provided. Design speeds are:

Rural Sections	Miles per Hour	
	Minimum	Desirable
Flat topography	60	70
Rolling topography	50	60
Mountainous topography	40	50
Urban Sections	40	50

All curves sharper than one degree shall be super-elevated. All curves sharper than two degrees shall be designed with approach transition curves. The following maximum curvatures shall be used as consistent with design speeds:

Design Speed (m.p.h.)	Degree of Curvature	
	Maximum	Desirable
70	4	3
60	6	5
50	9	7
40	14	11

The maximum gradients preferably shall not exceed 5 per cent and in any case shall not exceed 6 per cent. On short lengths only, gradients of 7 per cent may be used.

Where the traffic density per lane is less than 200, the surfacing or pavement shall be designed for 11-foot lanes. Where the traffic density is 200 or over, the surfacing or pavement shall be designed for 12-foot lanes.

In urban areas all surfacing or pavement shall be designed for 12-foot lanes. Where the traffic density is 800 or more, a divided highway facility is to be constructed.

The width of median strip shall be as follows:

	Width in Feet	
	Minimum	Desirable
Rural	15	40
Urban	4	12

Curbs or other devices may be used where necessary to prevent traffic from crossing the median strip.

The right-of-way for rural highways of the following widths is to be either purchased or placed under public control through easement or other means:

	Width in Feet	
	Minimum	Desirable
Two-lane highways	120	220
Divided highways	150	250

Sidewalks or safety walks are to be included on structures wherever the pedestrian traffic justifies.

In peacetime, good maintenance of traffic guide signs would have offset deterioration, but during the war years material for the manufacture and repair of signs was restricted, and in some cases was unobtainable. Lack of manpower caused many agencies charged with maintaining the signs, to reduce or discontinue their operations. With the long-term trend of highway travel on the upgrade, traffic and safety experts have recognized the need for sign reforms. The Public Roads Administration estimated that in 15 years vehicle mileage will be double that of 1940.

Numerous advances in the design and illumination of route markers and of danger and caution signs, especially those using symbols, have been made, but destination, location, and directional guide signs have not kept pace with these advances. Sometimes the spacing between letters and names of places is inadequate for good legibility, or too many names crowded on the sign, or the lettering is too small. Often, poor placement of the sign reduces its effectiveness, even though its design may be good. The commonest fault and perhaps one that causes the most accidents, confusion, congestion, and annoyance is that of placing the sign too close to the point where the drivers response must be completed, as in the case of intersections where a change in direction is indicated but the sign's message is read too late to allow for proper braking and turning.

Most directional signs are not illuminated and much of their visibility and legibility is lost at night and in foggy and rainy weather. The headlights of automobiles illuminate reflecting signs, but the area of headlight candlepower high enough to produce the desired effect is restricted. Deterioration of the reflecting quality of signs and other types of material also means loss of effectiveness of traffic signals. Silhouette signs and those illuminated by floodlighting or by a fixture above the message require constant attention and maintenance to keep them effective.

A commercial device useful in laying out channelization patterns and other complicated road marking work, especially at curves, was developed. There are numerous advantages of this device. Among them are 1. it defines lines to the natural movement of drivers,—no matter how complicated; 2. saves time in laying out work, particularly at curves; 3. reduces traffic delays, owing to the savings of time in laying out the markings; 4. acts as a safety device in that smaller areas are closed to traffic, and further, that workers do not have to cross traffic as often as formerly to check measurements; and 5. the cost of the device is negligible.

A study made by a traffic engineer indicated a definite trend for the nationwide use of white center lines and yellow barrier lines. Only seven of the 48 states use yellow for center lines. The most common use of color for center lines is white on black top and brick surfaces and black on concrete surfaces. Out of 48 states, 20 use this combination. Seventeen states use white for center lines regardless of the type of road surface. Twenty-nine states use yellow barrier lines while 13 states use white. Of these, five use a broken white line which changes to a solid white line to indicate a barrier or no-passing zone. Several states since the war have changed from yellow to white center lines. A few of these states may go back to yellow when it is again available. A yellow barrier line has more attention value than other colors, and the effectiveness of yellow is greatly increased when used alongside a white or black center line.

DIVISION IX

DEFENSE AND ARMAMENT

THE UNITED STATES ARMY

By Robert S. Thomas
Military Historian, Historical Section, Army War College

THE END OF COMBAT WAR

In 1945, the world passed from a state of combat war to a condition of peace. Armed resistance of our enemies collapsed. On the Italian Front, enemy forces surrendered unconditionally at 8 a.m. Eastern War Time, Wednesday, May 2, 1945. The formal surrender document was signed Sunday, May 6, at Caserta, negotiations being handled for the Allies by British Lieut. Gen. W. D. Morgan, representing Field Marshal Sir Harold R. L. G. Alexander, supreme Allied commander in the Mediterranean area. In the European theater, General Dwight Eisenhower announced the surrender of Holland, northwestern Germany, and Denmark, including Helgoland and the Frisian Islands, on Friday, May 4, 1945. All Western Front resistance had ended by Saturday, May 5, except for the Nazi Seventh Army which faced General Patton's American Third Army in Czechoslovakia. On Sunday, May 6, Admiral Doenitz ordered all German submarines to cease hostilities. Monday, May 7, Germany formally surrendered as Col. Gen. Gustave Jodl, representing what remained of the German Reich, signed a surrender agreement with Lieut. Gen. Walter Bedell Smith, representing the United States as General Eisenhower's Chief of Staff. The meeting occurred in a red schoolhouse in Reims, France. President Truman and Prime Minister Churchill announced Tuesday, May 8, 1945, as V-E Day and decreed that all fighting should cease at 6:01 a.m., Eastern War Time, on that date.

In the Pacific theater, a Tokyo radio broadcast on Friday, Aug. 10, stated an offer to surrender. However, since neither the United States, Great Britain, nor Russia were in receipt of a peace note, orders were given for the Allies to continue fighting. On Sunday, Aug. 12, a radio flash over the facilities of the National Broadcasting Company announced that the Japanese had surrendered. Within two minutes, this report was branded as premature and unfounded. Tuesday, Aug. 14 at 7 p.m., Eastern War Time, President Truman announced to the world that Japan had surrendered. On Sept. 2, 1945, Japanese representatives, in the presence of General Douglas MacArthur, signed surrender terms on board the USS *Missouri*, in Tokyo Bay.

ARMY ORGANIZATION

At the close of the year, administrative command organization was headed by Robert P. Patterson, Secretary of War (succeeding Henry L. Stimson), with Kenneth C. Royall, Under Secretary of War; Howard C. Petersen, Assistant Secretary of War (succeeding John J. McCloy); and Robert A. Lovett, Assistant Secretary of War for Air. The military phase of command included General Dwight D. Eisenhower, Chief of Staff (succeeding General George C. Marshall); General Jacob L. Devers, in command of Army Ground Forces; General Henry H. Arnold, in command of Army Air Forces; and General Brehon B. Somervell, in command of Army Service Forces.

At the cessation of hostilities in the principal theaters of operations, Army commanders were: General Courtney Hodges, First; Lieut. Gen. Lloyd R. Fredendall, Second; General George S. Patton, Jr., Third; Major General John P. Lucas, Fourth; Lieut. Gen. Lucian K. Truscott, Jr., Fifth; General Walter Krueger, Sixth; Lieut. Gen. Alexander M. Patch, Seventh; Lieut. Gen. Robert L. Eichelberger, Eighth; Lieut. Gen. William H. Simpson, Ninth; Lieut. Gen. Simon B. Buckner, Tenth; Lieut. Gen. Leonard T. Gerow, Fifteenth; Lieut. Gen. Lewis H. Brereton, First Allied Airborne (largely U. S. troops). Army Group commanders were: General Jacob L. Devers, Sixth; General Omar Bradley, Twelfth; General Mark W. Clark, Fifteenth. General Carl Spaatz, United States Strategic Air Forces in Europe; General George C. Kenney, Far East Air Force. Theater command was: European — General Dwight D. Eisenhower; Pacific—General Douglas MacArthur; Mediterranean—General Joseph T. McNarney (Deputy Supreme Allied Commander); Burma-India—Lieut. Gen. Daniel I. Sultan; China—Lieut. Gen. Albert C. Wedemeyer.

Service commands in the United States were headed as follows: First, with headquarters in Boston, Mass., Major Gen. Sherman Miles; Second, headquarters in Governors Island, New York, Major Gen. Thomas B. Larkin; Third, headquarters in Baltimore, Md., Major Gen. Philip Hayes; Fourth, headquarters in Atlanta, Ga., Major Gen. Edward H. Brooks; Fifth, headquarters in Columbus, Ohio, Major Gen. James L. Collins; Sixth, headquarters in Chicago, Ill., Major Gen. David I. McCoach, Jr.; Seventh, headquarters in Omaha, Neb., Major Gen. Louis A. Craig; Eighth, headquarters in Dallas, Tex., Lieut. Gen. Walton H. Walker; Ninth, headquarters in Fort Douglas, Utah, Major Gen. Wm. E. Shedd.

The Chief of Staff, General Eisenhower, had as assistants: General Thomas T. Handy, Deputy Chief of Staff; G-1, Major Gen. Willard S. Paul; G-2, Major Gen. Clayton Bissell; G-3, Major Gen. I. H. Edwards; G-4, Major Gen. Russell L. Maxwell; Operations Division, Lieut. Gen. John E. Hull.

The Chiefs of the several arms and departments were: Major Gen. Edward T. Witsell, Adjutant General's Department; Lieut. Gen. Daniel I. Sultan, Inspector General; Lieut. Gen. Edmund B. Gregory, Quartermaster General; Major Gen. Norman T. Kirk, Surgeon General; Major Gen. A. H. Carter, Fiscal Director; Major Gen. W. H. Kasten, Chief of Finance; Lieut. Gen. Raymond A. Wheeler, Corp of Engineers; Lieut. Gen. Levin H. Campbell, Ordnance Department; Major Gen. Harry C. Ingles, Signal Corps; Major Gen. Alden H. Waitt, succeeding Major Gen. William N. Porter, Chemical Warfare Service.

AIR SERVICE

Republic Aviation Corporation, in cooperation with Air Technical Service Command, developed a new single-seater plane, P-47 N, nicknamed "Thunderbolt," which has a flying speed exceeding 450 m.p.h., with a radius of over 1,000 miles of flying. The pilot functions as navigator, bombardier, gunner, and radio operator.

Flying at 20,000 feet altitude, a Tinian-based B-29 completed a nonstop flight from Honolulu to Washington in 17 hours and 21 minutes with an average speed of 285 m.p.h.

A Twentieth Air Force B-29 plane carried documentary photographs of initial landings in Japan from Iwo Jima to Spokane, 5,490 miles, in 23 hours, 33 minutes. The plane then continued on to Washington, D. C., flying the remaining 2,086 miles in seven hours. On the morning of Sept. 2, an ATC C-54 plane took off from Atsugi Field near Tokyo and flew to Washington, D. C., 7,400 miles, in 31 hours 20 minutes. This plane carried passengers and pictures of the Japanese surrender ceremony on board the battleship *Missouri.*

In November, a B-29, stripped of all excess weight, set a new world's record of 8,198 miles nonstop flight from Guam to Washington, D. C., covering the distance in 35 hours, 5 minutes. At the end of the flight, enough gasoline remained in the tanks for an additional hour and a half in the air.

Reginald Denny announced perfection of a pilotless plane, capable of reaching a speed of 200 m.p.h. This radio-controlled plane will be used for the present in crop dusting, weather observation, and mail delivery.

Successful tests, begun in August, demonstrated the practicability of converting the B-29 Superfortress to transport purposes. In the initial test, a B-29, so converted, carried 57 fully equipped men plus ammunition, food for seven days, and 6,400 gallons of gasoline, a payload of 17,000 pounds.

The Army Air Force announced the first jet-propelled combat plane, the P-80, built by Lockheed. Known as the "Shooting Star," it is believed to be the fastest fighter plane in existence.

A radically new bomber was developed by Air Technical Service Command and Douglas Aircraft Company. It is the XB-42, known as the "Mixmaster." This plane is driven by two counter-rotating Curtiss propellers located at the extreme rear of the fuselage, behind the tail surfaces. Two Allison V-type, liquid-cooled engines mounted in the fuselage drive the propellers, thus eliminating the necessity of engine nacelles and propellers being installed in the wings. It is the first bomber in the 400 m.p.h. class. Because of its unusual design, the plane features distinctive bailing-out procedure. The whole propeller installation, at the flick of a detonating switch, can be blown off, thus eliminating the possibility of crew members tangling with the propellers.

The activities of the Air Transport Command aroused worldwide interest. This Command was organized originally, May 29, 1941, as the Ferrying Command. Some few achievements in 1945 are named here. In January, the A.T.C., flying over the most hazardous airway in the world, moved more than 44,000 tons of supplies over the Hump, thus keeping open the aerial lifeline from India to China. To provide close liaison between Allied commanders in southeast Asia and those in Southwest and Central Pacific areas, regular round-trip air service was set up from India to Australia. Operating a trans-Atlantic aerial express line, the A.T.C. took American diplomatic and military delegates to and from the Big Three Conference at Potsdam, Germany. Early in September, plans were announced for curtailing operations of the A.T.C. By July 1, 1946, it was planned to bring the Command's 3,000 transport planes down to 650 and to reduce its military personnel from 210,000 to 80,000 or less. On Sept. 28, at 4:30 p.m., the A.T.C. inaugurated the first round-the-world scheduled aerial service; continuing plan is to schedule departures once a week. The first ship to fly this service was named the "Globester." In all operations, including transport, ferrying, training, rescue, and special missions, A.T.C. planes flew a total of 11,744,000 hours and a total of 1,549,938,000 plane miles. Approximately 3,252,000 passengers were carried, 305,600 of whom were sick and wounded patients.

The combat value of the Air arm was perhaps best summarized by Major Alexander de Seversky, after his observation trip to European and Mediterranean theaters of operations. He stated: "Allied victory in Europe came through Air Power. Control, or at least superiority, in the skies over the entire theater was indispensable to any successful operation on land or sea. Such superiority was achieved by the Allied Air Forces . . . by the time of the invasion of the Continent, the German Luftwaffe was reduced to impotence . . . the decision had been won in the skies; the invasion exploited the decisive victory." There was a repetition of this pattern in the Asiatic theater where the XX and XXI Bomber Commands drove Japanese planes from the skies and battered Japanese industrial and military targets with no letup. Railroad yards, airplane factories, oil depots, military camps, all were hammered on Honshu, Shikoku, and Kyushu Islands, as well as in mainland cities of Saigon, Indo-China, Burma, and Siam. On July 9, the 2,000,000th ton of American bombs, dropped since Dec. 7, 1941, fell on Japan during an air raid over Gifu, Sendai, Sakai, Wakayama, and Yokkaichi. A month later, our B-29 Superfortresses executed the most devastating air mission in history when, releasing a single atomic bomb in each instance, Hiroshima, and a few days later, Nagasaki, were blasted. Japanese resistance became a thing of impotence, and General MacArthur's forces later invaded Japanese soil without firing a shot or suffering a casualty.

EQUIPMENT

To deal comprehensively with the story of equipment during the year is out of the question in an article as space-limited as this. However, some of the notable items are focused briefly.

In order to service planes from the smallest wing nut to large wing and tail assemblies, huge barges were built by the Judson Pacific Shipbuilding Company of Oakland, Calif. and the Ingalls Shipbuilding Company of Decatur, Ill. These barges were stocked with 5,000 separate items to facilitate, by speedy repair and replacement, the progress of our forces heading for Tokyo.

Equipping and maintaining a soldier in continental United States cost the Quartermaster Corps' purchasing agents more in 1945 than in 1944. The figures were:

	1944	1945
Food	$215.35	$226.30
Clothing	173.70	212.00
Individual Equipment	44.70	63.93
Barracks Equipment	31.31	31.65
Totals	$465.06	$533.88

In 43 months' time from Dec. 7, 1941, the Quartermaster Corps spent:

Clothing	$ 5,182,402,000
Equipage	2,724,670,000
General Supplies	1,655,605,000
Materials' handling equip.	341,202,000
Subsistence	10,660,707,000
Total	$20,564,586,000

The following comparative figures on the First and Second World Wars soldier equipment are of interest:

	First World War	Second World War
Shoes	8-E and 8-D most popular	9-E and 8½ D
Socks	Size 10 worn by 31.4% of men	Size 11 by 31.8%
Trousers	Waist 32″—leg 32″	Waist 32″—Leg 33″
Shirts	15 to 15½ by 50% of men	14½ to 15 predominant
Hat	Size 7	Size 7⅛ to 7¼

The British needed locomotives desperately during the year. In 92 days the Baldwin Locomotive Works produced 18 locomotives, and, in the first air flight of its kind, these rail monsters were flown directly to Burma.

The Chemical Warfare Service developed three gas mask sizes, suitable to fitting all soldiers. In addition, this Service designed a special mask to protect men forming bazooka teams from particles blown back after rocket has left the bazooka muzzle.

Communication problems gave birth to two new radio sets used successfully in both theaters of war—the AN/VRC-1 and the AN/TRC-7. The first-named, designed for operation from a jeep, is a combination of high-frequency and very-high-frequency radio with a variable distance range of 20 miles for voice, 40 miles for tone, and 60 miles for continuous wave when high-frequency transmitter is used. The AN/TRC-7 is a portable set, carried by dismounted troops to maintain contact with aircraft. The set weighs 100 pounds and can be dropped by parachute to ground troops. It is a very-high-frequency transmitter and receiver and can be operated from a hand-operated generator or from dry cells.

A new record for round-the-world radio transmission was established by U. S. Army Signal Corps on April 28, 1945 when a nine-word radio-teletypewriter message completely encircled the earth in 9½ seconds.

A high-powered radio station was designed and built into 24 C-47 transport planes in a space of 42 hours to guide air fleets carrying occupation forces to Japan. These flying radio stations landed behind the American "jeep control towers" which were the first of our units to land on Japanese soil. Within 45 minutes after the C-47's landed on Atsugi airstrip outside of Tokyo, communications were established with Okinawa and Manila.

The Signal Corps revealed the functions and achievements of a radar set which detects enemy planes far beyond the range of human vision, following the enemy's course so accurately that it can automatically aim an aircraft gun so that the shells will explode within a few yards of the target. This radar set made the sound locator obsolete. It searches the sky in all directions and elevations and, by means of electronic lobe switching, catches and holds the suspected plane between a horizontal and a vertical beam, thus doing away with the necessity of observing anything except the recording echoes on the radar board. To destroy the efficacy of the enemy's radar work, the Radar Countermeasures Program of the Signal Corps cluttered German operation by releasing packages of foil from planes. This foil, known as "chaff," was released to the extent of 10,000,000 pounds during Allied bombardment of the Reich. Production of chaff in such quantities was made possible by our people willingly giving up the familiar wrappings formerly found around chewing gum, cigarettes, and candy bars. High-powered radio transmitters known as "Jammers," were very effective in blacking out German radar sets. In all countermeasures in this field, our scientists kept far ahead of Japanese efforts.

In January, 1945, communications troops in the European theater were stringing wire at the rate of 2,200 miles daily, to service a network extending to 140 principal headquarters. This work was speeded up by new procedures, born of war conditions. Wire in coil form was laid by airplanes, by bazookas, and by rifle grenades without the use of reels. In one case amphibious "Ducks" were used successfully; in another a liaison plane strung a line while flying at 110 miles an hour.

As a substitute for cotton duck formerly used in tarpaulins, the Quartermaster Corps developed a new material made out of laminated paper-burlap.

A solar still was developed by the Air Corps. Using the sun's heat against the still's transparent plastic bag, a pint of fresh water can be produced from salt water in a day.

A new wrapping to protect K rations shipped to the South Pacific was fabricated in the form of a triplex asphalt-impregnated bag, fitted between the outer case and the ration.

ATOMIC AND OTHER BOMBS

Progress in the munitions field was dominated by the development and use of the atomic bomb. In the desertlands of New Mexico a $2,000,000,000 experiment was brought to fruition when the first man-made atomic explosion was touched off at 5:30 a.m., July 16, 1945. Successful performance of this revolutionary weapon exceeded every estimate. The Atomic Bomb Project, headed by Major General Leslie R. Groves, was under the scientific direction of Dr. J. R. Oppenheimer, theoretical physicist of the University of California. When the test bomb, mounted on a high steel tower was fired, a blinding flash, as of lightning, lit up the whole area brighter than daylight. A mountain range three miles away stood out in sharp relief. The flash was followed by a tremendous roar and a heavy pressure wave, then a huge, multicolored cloud surged upwards to a height of over 40,000 feet—ordinary clouds disappeared in the path of this man-made phenomenon. The steel tower was entirely vaporized, and the earth was gouged in the form of a huge, sloping crater. The work of thousands of people over several years time had brought forth the most destructive agent ever conceived by man. This agent, dropped from the air over Hiroshima (Aug. 6, 1945) and Nagasaki (Aug. 9, 1945) broke Japanese resistance and practically dictated the terms of surrender. Hiroshima disappeared as a city with a terrific toll of life* and property; Nagasaki, not quite as badly damaged, still served to emphasize what was in prospect for the Japanese nation should it elect to continue fighting.

In connection with bomb development in the Army and Navy, a proximity fuse was built through the efforts of British and American scientists. The fuse assembly ranked with radar and the atomic bomb as one of the most decisive weapons of the war. The fuse consists of a small, wonderfully rugged radio transmitter and receiver, about the size of a man's fist. Placed in a bomb or projectile, it sends out high-frequency radio waves which cause the detonation of an explosive charge when they bounce back from enemy aircraft, vehicles, or the earth itself. Originally, electric power was provided for the minute radio by development of a tiny dry-cell battery, no larger than the cap of a fountain pen. The limitations of this kind of power were fully realized, and it was subsequently replaced by a generator, motivated by a small windmill propeller, recessed in the nose of the projectile. This tiny, wind-driven generator, evolved in perfection of the VT proximity fuse, was no larger than a watch and was so designed as to fit into the nose of an aerial bomb or rocket projectile. Whirling at 100,000 revolutions per minute, this windmill supplies power enough to create continuous emanation of radio waves from the bomb or projectile. To prevent the proximity fuse from detonating the explosive upon receipt of wave echoes from the aircraft which launched it or from other nearby friendly planes, connection between fuse and detonator is left open until after the projectile has been launched, after which it closes automatically.

A new skymarker bomb (M-87) invented by the Technical Command of the Chemical Warfare Service, makes a colored smoke trail through the sky. It was designed for use with precision instruments in bombing enemy targets through clouds, smoke screens, and other conditions preventing visual sighting.

A new incendiary bomb (M-74) was perfected. It is a 10-pound tubular contrivance which regurgitates its complex entrails almost immediately after landing on an enemy target. The stuff emitted (known as "goop,") looks like lava. It is a compound of magnesium powder, coated with asphalt.

The Army added an aerosol bomb to its equipment. Loaded with DDT (dichloro-diphenyl-trichlorethane), it wages war on mosquitoes and other disease-bearing insects.

OTHER EQUIPMENT

Motorized rocket units were in training during the year at Fort Sill, Oklahoma. Their use is in putting down a heavy barrage in a concentrated area ("mattress fire"). Each rocket weighs 38.4 pounds and has an explosive charge of 4.3 pounds of TNT.

Multiple-tube rocket launchers, fired electrically, were designed in several combinations. An 8-tube, 4.5″ rocket launcher, nicknamed "Xylophone," fires a rocket 30″ long, weighing 38 pounds, and having the power of a 105-mm. shell. This was used as a ground weapon or was fired from trucks and jeeps. A 60-tube launcher, "Callipoe," was built to be mounted on a tank turret so as to be rotated for 'round the circle firing. A 20-tube launcher, firing a 7.2″ rocket was called "Whiz Bang," and throws a rocket equivalent in firepower to the 155-mm. "Long Tom" gun.

In house-to-house fighting along the Rhine, the M-2 carbine, modified so as to make it an automatic firing weapon, proved especially effective.

Specifications were released to the public on the giant 914MM (36¼") mobile mortar, largest and most destructive weapon of its kind. It is capable of hurling a 3,650 pound projectile a distance of six miles. Known as "Little David," this weapon has a rifled, 22-foot, muzzle-loading tube which, with its firing mechanism and other parts of assembly make up a total weight of 80,000 pounds. Base assembly, a huge metal box, weighs 93,000 pounds. Tube and base assembly travel separately and the complete unit also includes a bulldozer and crane with bucket-shovel to dig the necessary emplacement. Even though it is larger than the 820MM German weapon, it can be emplaced in 12 hours, whereas the German gun, traveling on 24 railway cars, required three weeks to put into firing position.

The Ammunition Division, Army Ordnance Department, devised a new shell-loading machine. Part of it looks like a milking machine for a 24-teat cow; the other part looks like an assembly of 24 round bayonets slung under a steel bar. The "mechanized cow" cools the correct amount of TNT to exact temperatures, then pours it through the nozzles into 24 shells, mounted on a carriage. The shells are then moved to where they can be probed by the steam-heated "bayonets" in order to prevent formation of air cavities, a frequent cause of premature explosions.

FOOD

Early in the year, tests were made to ship eggs as non-refrigerated cargo. A fast-flying schedule to both European and Pacific theaters of operations established the feasibility of this procedure.

Army purchases of food in 1944, in dollar volume, were 80 per cent greater than those for 1943; those for 1945 jumped 20 per cent over the 1944 schedule.

The Transportation Corps' "Penguin Fleet" delivered fresh meat and dairy products to American troops in Germany, from Antwerp. Within eight hours after supplies were transferred from ship to truck they were available to the mess cooks. In work of this kind, the Quartermaster Corps had the volunteer services of 15 consultants from commercial refrigerated warehouses, to improve and improvise methods of handling perishable goods.

In the first five months of 1945, beef accounted for 1/3 of perishable tonnage shipped overseas.

The end of hostilities witnessed the turnback to civilian channels of much Army food. In October, 80,000,000 pounds of butter were made available to civilians, and in the same month approximately 124,210,000 special combat rations and 552,134,000 pounds of ration components were marked to be sold to United Nations Relief and Rehabilitation Administration for $100,000,000.

A new type refrigerator barge, BRL, operated by Army Transportation Corps and costing $1,120,000 to build, was designed to bring plenty of ice cream, fresh meat, fruits, and vegetables to soldiers stationed on Pacific islands. On this barge, 10 gallons of ice cream can be made every seven minutes, and five tons of ice every day. The equivalent of 64 carloads of frozen meat can be stored at 12° above zero, along with deck storage space for 500 tons of fresh vegetables, cheese, eggs, and other perishables. Eighty-four motors produce 440 volts of power to operate the cooling and freezing machinery.

Air crew lunches were modified so as to increase the carbohydrates. Fudge, assorted candy, and gum were added to relieve the impression of hunger experienced by air crews returning from their missions. A container was devised for the lunch which admitted of opening with one hand, even if gloved.

In March, calories in C rations were increased from 2,775 to 3,700 per man.

The American 27th Infantry Regiment, 25th Division, paid special honor to "Wolf," U. S. Army Dog T-121 who died from wounds received in action. His work in alerting the enemy at 150 yards on one occasion permitted a successful surprise attack by our troops and, although badly wounded, he continued to work until our success was assured. In a unique ceremony, the first Army Ground Force troops to be trained to handle war dogs in combat were graduated at Fort Robinson, Nebraska, in August.

The following breeds of dogs were listed as acceptable for training in Pacific areas: German shepherd; Belgian sheep; Doberman pinscher; collie (farm type with medium length coat); schnauzer (giant). Positive crosses of these breeds were also accepted.

DECORATIONS

The printed record of decorations bestowed upon officers and enlisted men for heroism in service is a matter for future government publication and will include thousands of names. A few decoration highlights, aside from such items as would appear in the general list of those cited for heroism in battle, are here presented.

WAC Colonel Oveta Culp Hobby, was the first militarized woman to receive the Distinguished Service Medal in the Second World War. The same award went to Jacqueline Cochran, formerly director of women pilots, Army Air Forces, the first civilian woman to receive the Medal. Mrs. Anna Rosenberg of New York City was the first recipient of a new civilian decoration, "Medal of Freedom."

There was created a new Medical Badge to recognize service rendered by Medical Corps men while on duty with combat infantry units.

On Sept. 7, 1945, the Army-Navy "E," awarded for industrial achievement in furthering the war effort was terminated.

MAIL

Because of tense military conditions in March, the War Department temporarily curtailed shipment of mail overseas in order to provide all possible cargo space for air transport of munitions. In August, facilities were provided to fly mail to Manila for prisoners of war and civilian internees held by Japan. From June, 1942, to August, 1945, Signal Corps V-Mail Section in the United Kingdom handled a total of 517,000,000 pieces of V-mail. Of this total, 259,000,000 were letters to our personnel stationed in the United Kingdom, while 258,000,000 were addressed to soldiers, friends, and relatives in the United States. Microfilming of V-mail was discontinued on Nov. 1, 1945. This service had been initiated in June, 1942, between the United States and the United Kingdom and was subsequently expanded to all theaters of operation.

To October, 1945, approximately 750,000,000 V-mail letters had been sent from America and about 700,000,000 had been received in America.

METEOROLOGY

The Army Air Forces Weather Division solved deficiency current weather observations over territories held by the enemy by developing a new technique of investigation known as "synoptic climatology," based on the frequency with which certain patterns of weather or distribution of weather elements occur. Army Air Forces Weather Service, Headquarters in Asheville, N. C., has been converted to a peacetime basis. This Service represented an initial installation outlay of close to $40,000,000 and employed a corps of highly trained officers and enlisted men. The Service grew from 43 stations with less than 300 personnel in 1937 to a globe-girdling network of 857 forecasting and observation units with 17,800 officers and men.

MILITARY GOVERNMENT

In May, it was announced that Germany was to be governed through a Control Council on which each of the four major Powers would be represented. Each power was to administer an allotted zone of Germany with a military commander as governor. Lieut. Gen. Lucius Clay was selected to represent General Eisenhower on this Council.

On Sept. 20, General Eisenhower submitted his second report on the operation of military government in the American Zone in Germany. A few of the items he stressed follow:

Control.—Control Council of the four Commanders in Chief was first established, followed by a Coordinating Committee of the Deputies, and the Directorates of the Control Staff.

German Governmental Organizations.—Continued progress was made in locating and earmarking suitable German administrative personnel for key positions in central departments and agencies to be established.

Civil Service.—Reestablishment of the former highly efficient German Civil Service System was sought. Nazis were removed from office and steps were taken to attract exceptionally qualified German personnel for general and technical training for the jobs to be filled.

Denazification. — During August, 18,300 active Nazis were arrested, bringing the total of this class arrested in the United States Zone to 66,500. As the Nazis were cleaned out of public service positions, more attention was paid to their elimination from private business and professional circles, where they were attempting to dig in and control community life. American officials took over control of the I. G. Farbenindustrie, and Nazi banks in the U. S. Zone were stripped of their former officials. If there was the slightest chance of a German industrial set-up being used for production that might eventually be turned against us, it was razed.

Political Activity.—Negatively this phase of control in the American Zone emphasized the removal from office and arrest of known Nazi office holders. A program for encouraging the growth of real democracy was instituted. The German people were told that they were to have the opportunity to prepare for the eventual reconstruction of their lives on a democratic and peaceful basis, particularly at the county level of governmental control.

Information Control. — Definite progress was made in this field towards the goal of purged, reoriented, and German-directed information media. American radio station programs were softened by the addition of more music and the lessening of insistence on retribution and placing of atrocity guilt; the first licensed German semi-weekly newspaper in Germany was published in August. It was the *Frankfurter Rundschau,* with a circulation of 415,000; after careful screening to eliminate Nazis, six applicants were licensed and registered as publishers; motion picture theaters were being slowly reopened, principally with American films.

German Reactions.—Some criticism was voiced to occupation procedure. Either there was too much or too little denazification. However, the average German had but little time to formulate active and organized opposition to the occupation. His immediate and pressing job was to get food, fuel, and shelter for the winter.

General Economic Conditions.—Most immediately, American officials had to work with the Germans toward providing food, mining coal, and putting transportation agencies into operation. To further this, unnecessary restrictions were removed so as to stimulate German economy to the end that a minimum of outside assistance would eventually be required. To balance the economic situation was a difficult task—shortage of goods and heavy excess of buying power in the hands of the people set up a definite inflationary trend.

Production Problems. — Shortage of skilled underground workers hampered production of coal. However, in September there was a definite upward trend in mine operations. Progress toward traffic restoration on the Rhine was forecast in mid-September by the arrival at Mannheim of 470 tons of coal shipped by barge from Cologne. By August, 82 per cent of main-line railroad trackage had been put back into operation. Industrial activity was hampered through lack of raw materials so that no more than 5 per cent capacity of industrial plants was in operation in the American Zone. However, in the production of building materials and timber products there was a marked upward surge.

NATIONALS

In April, a Brazilian Expeditionary Force numbering 25,000 operated with the American Fifth Army against the disorganized Germans in the Po River Valley. On the Stilwell Road, Chinese youths, many of whom had never seen a plane or power vehicle, were trained as truck drivers. On March 25, Italian Service Units in the United States completed their first year of organization, having contributed 1,000,000 man-days per month of essential skilled and unskilled labor at military installations. In a pre-war neglected industry, lignite coal mining, Italian miners produced 50,000 tons per month. Flying personnel of the Mexican Expeditionary Air Force were trained in Air Force installations in the United States. Their first unit to enter combat was the 201st Mexican Fighter Squadron which, on June 3, bombed and strafed Japanese tanks and positions in the Cagayan Valley of Luzon in the Philippines. Eleven members of the Canadian Army assigned to the First Special Service Force, Canadian and American troops, were decorated for bravery during operations in France and Italy. This American-Canadian First Special Service Force, together with the noted 99th "Norwegian" Separate Infantry Battalion made up "Task Force A," otherwise known as the 474th Infantry Regiment, a unit which was mountain-trained in Helena, Mont. This unit particularly distinguished itself in Italy at La Difensa, Mt. Sammuere, Mt. Majo, Rome, and in the capture of the islands of Port Cros and Levant.

MEDICAL

Army Medical personnel developed artificial eyes made of water-clear plastic and capable of being tinted to duplicate every appearance of the natural eye. In the Pacific, skin diphtheria was quickly brought under control to prevent epidemic conditions. In January, five more troop ships were stripped of armament and converted into U. S. Army hospital ships, raising the total to 29 and affording transportation to 18,000 sick and wounded. Penicillin lozenges, compounded of penicillin and gelatin, were used to clear up trench mouth in a day; tonsilitis in two days. In March, the War Department announced perfection of an improved artificial leg made of light metals, plastic, or fiber, with provision for interchangeability of parts.

Under a new system of refrigeration, whole blood was held at temperatures ranging from 39° to 50°, making possible its use after 21 days rather than 16, the previous period of possible holding. DDT was tested for large-scale use in battling malaria; especially effective against mosquitoes. Up to May 1, 1945, Army Hospitals in the United States treated 11,000 amputees. From the fall of 1942 to May, 1945, more than 1,000,000 sick and wounded soldiers of American and Allied forces were evacuated by the Army Air Forces. A new method of quick-freezing whole milk made it possible to serve wounded soldiers returning from overseas on Army hospital ships with milk. In some instances, milk was held in a frozen state for three months before it was used. Eight centers were established in the United States for treating soldiers suffering from tropical skin diseases. The Army made use of the new wonder drug, streptomycin, in the treatment of urinary tract infections. In September, the total output of this drug was only 14 ounces, although four companies were engaged in its manufacture.

Since Pearl Harbor, the Army Dental Corps made 71,700,000 fillings; did 16,500,000 extractions; and fashioned 2,600,000 dentures for Army personnel. Army dentists were also active in perfecting techniques associated with formation of plastic ears, noses, and chins.

The Signal Corps, working with the Medical Corps, adapted electronic principles akin to those used for radar to develop "sensory aid," whereby the blind can probe their surroundings by means of a beam of light and "feel" obstacles within a radius of 20 feet. The device, about the size of a loaf of bread, is referred to as an "optical cane."

Another achievement for the Signal Corps, at the request of the Surgeon General, was the development of a new camera using an ultra high-speed, high intensity, self-contained light source. The camera operates easily, taking pictures in black and white or in color, indoors or out, at distances from six inches to 12 feet. Except for focusing and clicking the shutter, its action is entirely automatic. Light source for the new camera is a coiled, circular quartz vapor discharge tube, designed by GE, and giving a flash of approximately 1/25,000 second duration. This camera, valuable to surgeons for recording steps in the course of difficult operations, is fast enough to "freeze" the whirring of a moving fan blade.

Nine Korean physicians, at the expense of the International Health Institute, Rockefeller Foundation, began training in American schools in order to lay the foundation for an efficient, self-sufficient medical service for the Korean nation. No Korean citizen had had opportunity to develop in this field for the past 30 years under Japanese domination.

In July, the War Department announced that all transportable sick and wounded would be brought home from Europe within 90 days after VE-Day. Actually most of the job was done within 60 days.

Every effort was made early in the year to recruit the Army Nurse Corps to full strength. Evelyn Blewett of the War Advertising Council was appointed as civilian consultant to the Surgeon General to assist the Army's publicity drive for the enlistment of nurses. Because of slowness in recruiting, any registered nurse who conformed to Army standards was eligible for consideration as a commissioned member of the Army Nurse Corps. By February, 1945, it was possible to show a net gain of 800 by reason of having commissioned 1,050 nurses in January. Continued pressure was maintained until cessation of hostilities. On Feb. 2, the Army Nurse Corps was 44 years old. Major Gen. Paul Hawley, Chief Surgeon in the European theater of operations, said of the nurses: "Magnificent is the one word that describes the job they are doing. . . . A part of every soldier's heart is reserved for them. . . . The Army Nurse is a good soldier." In the Seagrave Unit in Burma, 19 nurses were decorated with the Bronze Star Medal.

PRISONERS OF WAR

The horrors of enemy camps where American officers and enlisted men were held in confinement as prisoners of war have been exploited in the press and have fully emphasized, by contrast, the humanitarian side of American principles and standards. It is almost needless to point out that, as regards Japanese and German prisoners of war held by us, there were no Dachaus, no Buchenwalds, no punishment crematories, racial or otherwise, and no death marches of Bataan. Early in 1945, Feb. 10, the following enemy prisoners were held in continental United States: German 305,742, Italian 50,578, Japanese 2,820, Total 359,140.

The small number of Japanese recorded in the above total is mute evidence of their fanatical desire to die for their Emperor rather than be taken prisoner. In March, plans were made to bring an additional 100,000 German prisoners to the United States to, (1) ease the burden laid on American forces in Europe for their care and, (2) to help meet the acute labor shortage in this country. In the first three months of 1945, prisoners of war in the United States did more than $44,000,000 worth of work.

From D-Day in Europe, through April 25, 1945, the Allied armies captured 2,628,529 prisoners. In November, the War Department announced that prisoners of war would be withdrawn from all labor in the United States by the end of April, 1946 and that they would be shipped out of this country. Prisoners of war rate of work mounted to 10,000,000 man-days of work per month. The schedule for returning these prisoners to their native lands was given as follows:

	Italian	German
December, 1945	9,000	60,000
January, 1946	11,500	70,000
February	4,800	70,000
March		83,000
April		43,000

For those of our men held prisoner in enemy hands, every effort was made, principally through the International Red Cross, to provide necessary food, medicine, clothing, and blankets. During February, March, and April, a group of repatriated prisoners of war from Germany and escapees from Japanese prisons toured American cities to tell the civilian population of conditions in enemy prison camps.

The Surgeon General of the United States Army reported that reconquest of the Philippines came at a time when American civilian prisoners of war at Santo Tomas, Los Banos, and Bilibid internment camps were slipping over into conditions of extreme starvation.

RAILROADS

In July, the United States relinquished operation of the Iranian State Railway. In 30 months of operation, it carried 3,000,000 long tons of lend-lease war material to Soviet Russia. The 685-mile line had to be completely rehabilitated when Americans took over its operation, since most of the equipment at that time was ready for the scrap heap.

From November 1942 to June 30, 1945, American railroads had a record of over 1,000,000 trips, involving multimillion miles, in the transportation of over 510,000 sick or wounded soldiers. To help the Army's redeployment plan in the summer, Army planes aided the rail effort. In June, several thousand soldiers with previous railroad experience were furloughed to help solve the heavy transportation problem. To provide maximum sleeping facilities for the long ride from Camp Kilmer, N. J., to the West Coast, "rotation sleeping" was initiated.

On Aug. 3, the largest single rail movement of troops in the United States was initiated—31 trains, including 331 Pullmans, 100 coaches, and 41 kitchen cars hauled 22,000 returnees from Camp Kilmer to 22 scattered reception stations, where the men were to be processed for separation from military service.

RECRUITING

On Oct. 12, the first class of "Recruiters," 153 officers and 153 enlisted men, was graduated from The Adjutant General's School at Ft. Oglethorpe, Georgia. By Oct. 19, voluntary enlistments in the new peacetime Regular Army reached 44,799. Of these, 48.92 per cent were from former Regular Army soldiers; 43.15 per cent, men who were presently serving or who had served under Selective Service call; 7.93 per cent were original enlistments of men with no previous service. Under the Armed Forces Voluntary Recruitment Act of 1945, enlistments were provided at three years, two years, and 18 months. Liberal retirement and furlough privileges were held out to prospective soldiers. The whole program was put in the hands of a recruiting expert, Brig. Gen. Harold N. Gilbert. This same officer was awarded the Distinguished Service Medal in 1941 for building up the Army, prior to Pearl Harbor, in the largest peacetime recruiting program the Army had ever attempted up to that time.

SALVAGE AND SURPLUS

In March, our 230th Quartermaster Salvage Collecting Company in Italy delivered 38,143 pounds of soap to ration dumps. The 299th Quartermaster Salvage Repair Company, with our Fifth Army in Italy, devised a means of reclaiming thousands of dollars worth of equipment from piles of rusted, coal-blackened kitchen and mess gear. A power-line of wire brushes was devised to clean and burnish discarded utensils, while a sand blast machine was made to clean formerly discarded knives, forks, and spoons. The only expense to the Government was for gasoline to operate the improvised machinery.

In August, 700 German prisoners of war were sent to Alaska to salvage lumber needed in the Pacific Theater.

From July, 1942, more than 12,160,000 pairs of military type shoes were rebuilt at an approximate saving of $1.15 per pair, or a total money saving of $13,978,000, plus the important saving of a critical item, 30,401,000 square feet of military quality upper leather.

Machine tools and production equipment, 33,158 pieces, costing originally about $150,000,000, were released as surplus in May, June, and July. Other surplus released in May, June and July to the disposal agencies included:

3,159	wool and leather jackets, cost $39,302
11,742	pairs of high-top leather boots, cost $139,729
5,200	rubberized and oil treated raincoats, cost $88,811
8,000	parka type women's raincoats, cost $62,800
2,209	sleeping bags, cost $42,280
3,885	tons animal food (chiefly hay and grain), cost $224,632
14,794	pairs of snowshoes, cost $64,649
66,490	watch compasses, cost $199,470
68	marine tractors, cost $535,855
53	marine engines, cost $1,791,126
538	pieces of road building equipment (tractors, graders, bulldozers, cost $1,743,637
	Drugs and medicines, including tannic acid, mercurochrome, peptone, phenol, digitalis, cost $495,813
438	telescopes, cost $30,660
22,966	steel tool cabinets, cost $344,000
565,800	dust respirators, cost $459,552
619,700	radio tubes, cost $3,752,692
1,492	rectifiers, cost $3,973,646
756,000	pounds raw rubber, cost $249,480
1,419,628	ampules of 20 c.c., chemical disinfectant (methyl bromide), cost $1,432,607
5,030,000	steel tubing, cost $140,799
766	radio transmitters, cost $1,194,600
6,300	fire extinguishers, cost $230,084

Salvaged and surplus material was sold to the Dutch East Indies Government to the amount of 65,000 tons for $20,000,000. In the last half of August, the Corps of Engineers released to disposal agencies $145,000,000 worth of surplus materials.

In September, theater commanders declared 112,042 motor-powered vehicles and 11,000 trailers as surplus. In the same month, nearly $21,000,000 worth of Army snow and winter clothing and equipment was scheduled for sale as surplus. From sales of wool and cotton clippings and of scrap leather and metal, three Quartermaster Depots recovered $3,866,537 for the Government in one year. In the first six months of 1945, oil and gasoline drums to the number of 1,822,000 were reclaimed at a cash saving of $4,555,000 and a material saving of 65,000 tons of heavy gauge steel. In August, construction equipment (tractors, cranes, graders, hoists, drills, snow plows, derricks, etc.) to the value of $30,000,000 was released as surplus. By mid-August, the value of Army property reported to disposal agencies since the war began was $4,000,000,000.

STRIKES

Periods of industrial unrest punctuated our production efforts, both before and after the cessation of hostilities. In January, the President directed the Secretary of War to take over and operate the Cleveland Electric Illuminating Company because a strike in that plant threatened to cripple war production vital to manufacture of parts for tanks, guns, trucks, and planes. In June, Secretary Patterson appealed to 17,000 striking workers at the Goodyear Tire and Rubber Company plant at Akron to return to work since their absence from work was a direct aid to our enemies.

RESERVE OFFICERS TRAINING CORPS

The War Department reopened advanced courses in R.O.T.C., and those who can qualify are to be paid a monthly allowance of approximately $370 per month. In addition, during attendance at a six-week R.O.T.C. camp, members would receive between $70 and $75 pay. These inducements are in addition to those which veterans may receive while attending college under the GI Bill of Rights. The basic R.O.T.C. course had been kept operative during the war. The first R.O.T.C. classes were graduated in 1920; since then, more than 160,000 men have been commissioned 2d Lieutenants, O.R.C.

EDUCATIONAL PROGRAM

In the program of education for troops in the European theater of operations, provision was made for setting up schools in battalions and similar military units; in civilian educational institutions; in special Army University Centers; in centralized vocational schools; and in study-by-correspondence systems. First of the university centers was opened in July at Shrivenham, England. The University of Florence, Italy, under this plan, also opened in July with 1,320 students.

TRANSPORTATION CORPS

This Corps operated speedily and efficiently to get returning soldiers home swiftly. Men were debarked from ships at the rate of 1,000 per hour. American Red Cross workers met them with food, milk, and coffee; then, by bus, plane, and train, they were taken to barracks to be processed for the final journey home.

From June, 1944, through May 8, 1945, the Corps had handled the following amounts of supplies destined for invasion forces in Europe:

To Marseilles	3,259,336 tons
Cherbourg	2,697,341 "
Antwerp	2,665,347 "
LeHavre	1,169,162 "
Rouen	1,164,891 "
Ghent	614,861 "
Port de Bouc	467,451 "
Nice	14,478 "

In the movement of troops and supplies into the Pacific, nearly 2,500,000 troops and more than 44,000,000 ship tons of cargo were sent from West Coast points from December, 1941, through August, 1945.

For the entire effort, the volume of supplies exported was so tremendous that it totaled more than 14 times that shipped abroad in the First World War. In actual figures it amounted to 126,859,000 ship tons, while the comparable total for the First World War (20 months) was 8,883,297 ship tons.

For port records of 45-month period of the war, see table, page 377.

The Army's great ports of embarkation handle two-way traffic. The bulk of their work was devoted to processing returning troops. From VE-Day through the end of August, more than 1,225,000 incoming troops were received. The great majority, or 1,110,000, came from Europe or other inactive Atlantic theaters through East Coast ports, principally New York, Boston, and Hampton Roads.

UNIFICATION

On Oct. 17, Secretary of War Patterson spoke before the Senate Military Committee on the subject of unification of administrative control of our armed forces. Prefacing his opinion on the question, he said: "After every great war, we see a popular revulsion. The inclination of the American now is to blot out and forget the horror and brutality and privation of World War II. But we who have directly laid upon us the responsibility for the future security of our country cannot run away from that responsibility. We must constantly give our best thought and our unremitting effort to safeguarding the peace which has again been restored to the world." Secretary Patterson then made clear his position on the main issue: "In my opinion, the unification of our armed forces is an essential step in the development of a sound program for the future security of the American people."

The following day, General Marshall, appearing before the same Com-

TROOPS AND ARMY CARGO SHIPPED TO OVERSEAS THEATERS

(December, 1941, through August, 1945)

	Troops[1]	Cargo Ship Tons
Total for All Ports	7,306,000	126,859,000
Boston	741,000	9,399,000
New York	3,184,000	37,800,000
Philadelphia#	500	5,893,000
Baltimore#	1,350	6,504,000
Hampton Roads	725,000	12,522,000
Charleston	36,000	3,216,000
Total East Coast Ports	4,687,850	75,334,000
Total Gulf Coast Ports (New Orleans & Others)	167,000	7,239,000
Los Angeles	188,000	8,645,000
San Francisco	1,655,000	22,751,000
Portland*	53,000	1,731,000
Seattle	524,000	10,219,000
Prince Rupert*	31,000	940,000
Total West Coast Ports	2,451,000	44,286,000

[1] Includes small portion of Allied troops and civilians traveling on official Government business.
# Cargo Ports of Embarkation.
* Sub-Ports of Embarkation.

mittee stated his accord with Secretary Patterson's views. General Marshall in pleading for unification said: "The national security is measured by the sum, or rather the combination of the three great arms—the land, air, and naval forces. The urgent need is for an over-all, not a piecemeal, appraisal of what is required to solve the single problem of national security with the greatest economy compatible with requirements. I am strongly convinced that, unless there is a single department for the armed forces . . . there can be little hope that we will be able to maintain through the years a military posture that will secure for us a lasting peace."

Another witness, General Jacob L. Devers, Commanding General of the Army Ground Forces, on Nov. 14, affirmed his agreement with Secretary Patterson's views. In his closing statement, General Devers said: "To fight the war of the future will require the elimination of our service consciousness which, in my opinion, can be obtained only by combining the Offices of the Secretary of War and Secretary of the Navy into a single department with its resultant evolutionary unification of the Army, Navy, and Air Forces."

General Omar N. Bradley followed on Nov. 15 with this statement, "On my experience as a combat commander in the field only, I am convinced that we must have unified command in time of war . . . unless there is unity of control at the top in peacetime, there can be no immediately effective unity of field command in wartime."

General Eisenhower, Nov. 16, lent the weight of his opinion to unification, closing in these words: ". . . there is no such thing as a separate land, sea, or air war; therefore, we must now recognize this fact by establishing a single department of the armed forces."

WOMEN'S ARMY CORPS

In January, formation of a Negro WAC unit was announced to serve as a postal battalion abroad. In Bermuda, an officer and 58 enlisted of the WAC reported for the first time in that country for duty with the Air Transport Command. Again for the first time, 28 of the Corps attended Army Air Force Chaplain Transition

Course. Fifty-eight Hawaiian women were brought to Continental United States and given basic training in the WAC for assignment to Army installations.

On Feb. 1, 1945 recruiting was begun to build up WAC medical units in General Hospitals. Seven women of the WAC replaced men as radio operators on U. S. Army hospital ships in March. Purdue University opened a school for WAC officers assigned to administrative duties. In May, age limit for enlistment in WAC was lowered from 50 to 38. For return to the United States, the first WAC contingent left Italy on June 5 by air. Twenty-seven WAC members of the 341st Signal Service Battalion operated the Big Three Conference switchboard at Potsdam, Germany.

Aug. 2, plans were announced to recruit 10,000 additional women for the WAC; August 29, enlistment in the WAC was discontinued and plans were made to demobilize on a proportionate basis with men in the Army.

REDEPLOYMENT

The end of the war in Europe focused attention on problems involved in defeating Japan with especial reference to the size of the Army required to do the job. The Joint Chiefs of Staff, after consultation with General MacArthur and Admiral Nimitz, made a preliminary estimate of troops and equipment necessary to crush Japan in the shortest possible time and with the smallest cost in American lives.

In May, our Army strength was 8,300,000. For the spring of 1946, a strength of 6,968,000 was planned since that figure represented all the strength it was believed could be effectively deployed against Japan, plus the maintenance of occupation forces in Europe, and training and supply forces in the United States. The Japanese had an organized military force of more than 4,000,000 men, in addition to many more who could be utilized for service forces or, if need be, combat. Some were in the Japanese home islands; some in China; some in Manchuria and Korea; some in far scattered parts of the Pacific and in the East Indies. The first necessity then of our forces was to keep these enemy forces apart and, when our bases were established and our armies deployed, strike with overwhelming power for a quick decision.

The necessary Pacific force had to be built from three elements: (1) troops already in the Pacific area; (2) physically fit soldiers in the United States who had not yet served overseas; and (3) troops who could be moved from the European to the Asiatic theater of operations. This latter group involved the greatest transportation problem ever undertaken in war. Distances were tremendous—from Europe to Manila, by way of the Panama Canal, 14,000 miles; from San Francisco to Manila, 6,771 miles—and over all other considerations was the need for speed so that the enemy could not rest or have time to reorganize his defenses.

Initial plans called for shipment straight from Europe to the Orient as well as for taking as many troops as possible through the United States. These latter soldiers had furloughs arranged en route as well as training periods in the United States, since conditions of fighting the Japanese were known to be radically different from those encountered in fighting the Germans. The bulk of those who went directly to the Pacific from Europe were service troops necessary to construction of communications, harbors, bases, and required airfields.

Comparative figures give some idea of the size of the job. After the First World War, it took a year to bring back the 2,000,000 men of the A. E. F. In 1945 we had to move double that number out of Europe, and a large number of them had to be transported over 14,000 miles of ocean to the far reaches of the Pacific. Equipment and supplies, both from Continental United States and from Europe, had to be provided for our soldiers scheduled to fight Japan. Therefore, every ship that could be pressed into service was used, including converted cargo and grain ships, regular passenger ships, troop transports, and the mighty passenger liners, *Queen Elizabeth, Queen Mary, Europa,* and *Aquitania.* To aid in this work, by carrying 50,000 men per month, 800 transport planes were assigned, scheduled to bring out combat troops from the heart of Germany, men with long periods of combat service. Demobilization, although secondary in urgency to redeployment, was not set aside for there were many men eligible for discharge and not scheduled to fight against Japan. These were entitled to speedy return from Europe. Every facility of the globe-girdling Air Transport Command, with its hub at Casablanca, was pressed into service to aid in this tremendous, two-pronged job.

The Army's plans for redeployment and readjustment of its manpower, after victory in Europe, were told in a technicolor film, "Two Down and One to Go," released to the public for propaganda purposes.

Those coming from Europe and going to Japan *via* the United States were scheduled for training in this country in carefully selected Army camps and stations. This training had one objective—to improve the preparation of veterans of the German war to meet their new enemy by acquainting them with Japanese tactics, and with the climatic, terrain, and health conditions encountered in the Pacific areas. The training was especially severe.

Arrangements were made in the redeployment so that men coming through the Port of New York would be processed through Camps Shanks, Kilmer, and Fort Hamilton; those through Hampton Roads would be handled at Camp Patrick Henry; those at Boston, through Camp Myles Standish; those at New Orleans, through Jackson Barracks.

On July 5, the Secretary of War's Office reported that the movement of troops from Europe was right on schedule. In the six weeks following May 20, when the first ship bearing troops for redeployment docked in this country, a total of 340,000 soldiers arrived in the United States from Europe and Atlantic bases.

July 8, the War Department announced that the complete Infantry Divisions already back in the country, with personnel on furlough prior to assembling again for training, were the 86th, 97th, and 95th. Elements of the 104th and advance detachments of the 2d, 4th, 5th, 8th, 44th, and 87th Infantry Divisions as well as part of the 13th Armored Division had come back to the United States, along with Headquarters, First Army. In practically all cases, men returning from Europe with point scores under the minimum for discharge were the ones scheduled for redeployment to the Pacific.

Original planning schedules of the War Department set up the following listings of divisions to embark from the European and Mediterranean Theaters:

July:—13th Armored; 87th, 4th, 8th, 2d, 5th, 44th Infantry.
August:—20th Armored; 85th, 28th, 30th Infantry.
September:—14th, 5th, 6th, 7th Armored; 17th Airborne; 88th, 91st, 35th, 45th, 103d Infantry.
October:—9th Armored; 92d, 26th, 79th, 99th Infantry.
November:—10th Armored; 10th Mountain; 13th Airborne; 83d, 63d, 106th Infantry.
December:—2d, 11th Armored; 34th, 98th, 80th, 76th Infantry.

At the same time that the above listing was published, the following divisions were announced to be held in Europe as part of the occupational forces: 1st, 4th Armored; 82d Airborne; 1st, 3d, 9th, 36th, 29th Infantry. At least for the remaining months of 1945, the following divisions were scheduled to remain in Europe: 3d, 8th, 12th, 16th Armored; 101st Airborne; 42d, 65th, 66th, 69th, 70th, 71st, 75th, 78th, 84th, 89th, 94th, 100th, 102d Infantry. This was the original schedule; later events modified the whole program.

In addition to the tremendous complexity of handling a redeployment and demobilization problem concurrently, the Secretary of War's Office was plagued by insistent demands of industrial and professional groups for the release of men from the Army for civilian needs. Such requests ranged from 110,000 men for the coal mines to three men for breeding mice. Loggers, longshoremen, policemen, firemen, teachers, ministers, college students, farmers, dairymen, doctors, dentists, engineers, draftsmen, railroad and textile workers, shipyard mechanics, hard-rock metal miners, tire builders—all were urgently needed at home. The Secretary of War pointed out that he could not accede to these requests since it would have meant the release from the Army of at least 1,000,000 men, with an immediate breakdown of the merit-system of discharge. That system gave first consideration to those who had served the longest, who had fought the hardest, and who had children. Civilian skills had no part in the points-for-discharge system thus set up. Incidentally, the system had been established on the bases of the expressed beliefs of the enlisted men themselves.

With the collapse of Japan on Aug. 14 came the need for readjustment and curtailing of the whole redeployment program. On Aug. 22, Major Gen. Charles P. Gross announced that, as a result of the Japanese surrender, more than 225,000 measurement tons of war cargoes on Pacific-bound ships in United States ports and more than 110,000 tons of War Department railway freight had been turned back; 27 Army-allocated freighters were ordered to discharge their cargoes at ports of embarkation; 11 freighters were called back after sailing from American ports; 39 cargo vessels were ordered back to European ports from which they had sailed for Pacific destinations. More than 5,400 railroad cars carrying Army freight destined for use against Japan were also diverted.

The curtailment of redeployment made necessary the immediate drastic adjustment of demobilization programs. On Sept. 5, General MacArthur recommended that ". . . . only three of the six divisions allocated for redeployment be sent to the Pacific." The War Department thereupon named these three as the 86th and 97th Infantry and the 13th Airborne. From these, the 13th Airborne was subsequently deleted.

Training work at the camps set up to handle troops scheduled for redeployment came to an end. In June, the following installations had been specifically named to serve the Divisions indicated: Camp Swift, Tex., 2d; Camp Butner, N. C., 4th; Camp Campbell, Ky., 5th; Fort Leonard Wood, Mo., 8th; Camp Cooke, Calif., 13th Armored; Camp Gruber, Okla., 86th; Fort Benning, Ga., 87th; Camp Shelby, Miss., 95th; Fort Bragg, N. C., 97th; Camp San Luis Obispo, Calif., 104th.

DEMOBILIZATION

On May 10, Secretary of War Stimson had this to say about demobilization: "It is the earnest desire and the firm intention of the War Department to restore the men who have come into the Army in this emergency to their homes and families as rapidly as the military situation permits. The defeat of Germany gives us our first large-scale opportunity to do this, and we have developed a program based on the principle of justice and equity for each individual to select those soldiers who are entitled to leave the Army first."

The Secretary visualized the release of 1,300,000 officers and men and members of the WAC by May, 1946.

The plan was keyed to an Adjusted Service Rating Card, with May 12, 1945 as a stop date, when point totals towards separation from service were entered. These points were based on four types of credit, viz:

Service Credit—1 point for each month of service since September 16, 1940.

Overseas Credit—1 point for each month served overseas since September 16, 1940.

Combat Credits—5 points for the first and each additional award or decoration for service performed since September 16, 1940. In the Army these awards were: Distinguished Service Cross; Legion of Merit; Silver Star; Distinguished Flying Cross; Soldier's Medal; Bronze Star Medal; Air Medal; Purple Heart; and Bronze Service Stars (battle participation stars).

Parenthood Credit—12 points for each child under 18 up to a limit of three children.

Between May 12 and July 31, 1945, using a score of 85 points as necessary for separation, 235,000 long-service soldiers were discharged from the Army. By Aug. 15, Secretary Stimson had radically revised his estimate as to numbers that could be discharged. He said: ". . . . we shall try desperately to discharge five million high point men in the next twelve months. The greatest number we ever sent overseas in a year was about 2,500,000. We now expect to get enough men back fast enough to discharge 5,000,000 men in twelve months."

On Sept. 3, the first reduction in points was announced when 85 points as a requirement were dropped to 80 and points for WAC members were reduced from 44 to 41. Addressing members of Congress in the auditorium of the Library of Congress on Sept. 20, General Marshall said: ". . . . we are going down to a critical score for enlisted men of 70 points on October 1 and to 60 points on November 1." On October 26, the War Department announced that, through October 21, more than 2,000,000 soldiers had been discharged from the Army since VE-Day, with an additional 250,000 expected to be returned to civilian life by Nov. 1. The demobilization program was running far ahead of schedule.

On Nov. 16, a further reduction in necessary discharge points was announced. Under the new demobilization schedule, which went into effect Dec. 1, the following eligibility standards were established: Male enlisted personnel were eligible for discharge if they had—55 points as computed on Sept. 2, 1945, or four years of honorable military service, or three or more children under 18 years of age dependent upon them for support. In addition, certain previously established factors effecting discharge were kept in effect, to wit, if the enlisted man was 35, 36, or 37 years of age and had completed two years of honorable military service, or if he was 38 years of age, regardless of the period of his military service.

Enlisted members of the WAC were eligible for discharge under this revised table if they had 32 points as computed on Sept. 2, 1945, or, if married, regardless of when, and enlisted prior to May 12, 1945. A WAC member could also get out if she were 35, 36, or 37 years of age, with two years of honorable military service, or 38 years of age regardless of the period of her military service. The Dec. 1 schedule for separation of male officers was (excluding Medical Department)—73 points as computed on Sept. 2, 1945, or four years three months of honorable military service. Any who were 50 years or over were also eligible for discharge. WAC officers needed 37 points as computed on Sept. 2, 1945, or they could be released if married and enlisted prior to May 12, 1945 or if they were 40 years of age or over.

Comparison of First World War and Second World War demobilizations brings out some striking facts. On Nov. 11, 1918, the strength of the American Army was 3,673,888 and, of these, 1,929,760 were serving overseas, most of them in France. It was decided to demobilize by military units and also to discharge men as near their homes as possible. Thirty-three demobilization centers were set up. Men in this country, without overseas service were discharged wholesale before any arrived from Europe. After the Second World War, putting into effect the long-planned point system, 3,114,000 men had been discharged, in an orderly and equitable manner by Nov. 16, 1945—more men than were in the whole AEF of the First World War. Whereas 33 demobilization centers were in use in 1918-19; Second World War men were handled by 27 such centers. The progress of demobilization, for 7 months after hostilities in each of the wars can be seen in the following table:

First World War		Second World War	
1918		1945	
November (11-30)	44,002	May (12-31)	56,000
December	621,203	June	156,000
1919			
January	332,666	July	164,000
February	307,398	August	205,000
March	306,250	September	597,000
April	285,328	October	1,270,000
May	437,389	November	1,200,000
	2,334,236		3,648,000

After the First World War, troops from France began getting back to this country in the spring of 1919—the overseas service men were the last to be discharged. In 1919 it took an average of from three to four weeks after arrival in the United States to be discharged. After the Second World War, by releasing the men not in military units but as individuals, on the basis of their service, the overseas man was not discriminated against, and when he arrived at a separation center in the United States, he was separated from the Army, on an average, within 48 hours.

Medical Corps personnel, handled separately, were released rapidly to civilian life. The Army's quota of 13,000 doctors to be released to civilian life by Dec. 31, 1945 was exceeded by Nov. 21. From a peak strength of over 45,000 doctors, Surgeon General Norman Kirk announced that all but 11,000 would be out of military service by June 1, 1946. For the week ended Nov. 16, 1945, the total of nurses released was 20,222 and for dentists, 2,460.

WAR CONTRACT TERMINATIONS

Demobilization of manpower brought with it cutbacks in the items of food and equipment which had been contracted for by the War Department for a war job. Secretary Patterson, April 3, announced a sharp cut in facilities projected for Autumn. On April 25, because of reduced consumption of some items in the European theater of operations, further cuts in war production were put into effect. Foreseeing the necessity of handling commercial details smoothly, the War Department set up a new type pre-termination-of-contract plan to facilitate inventories of goods under contract and production when war should end. A few instances of contract terminations, by no means complete, are given to show a cross-section of this phase of demobilization.

Contracts for more than 10,000,000 pairs of combat boots, service shoes, and shoe pacs, scheduled for December delivery, and amounting to $59,000,000, were cancelled in August. A total of 220 government-owned plants producing for the Army Service Forces, and 32 for the Army Air Forces were marked for disposal through the Reconstruction Finance Corporation. In this same month the following items were cancelled:

13,000,000	packages of cigarettes	$ 300,000
	soluble coffee	790,000
600,000	pounds of processed cheese	
4,883,000	pounds of dehydrated onions	
1,604,000	pounds of carrots	
	gasoline and lubricants	19,011,468
	petroleum containers	24,000,000
	canned vegetables cut 44% over July estimates	
	canned fruits cut 46%	
173,742,914	sq. yds. of cotton, rayon, and nylon	83,646,270
10,000,000	pounds of jelly	
27,000,000	pounds of marmalade	
22,500,000	pounds of jam	
18,500,000	pounds of peanut butter	
12,500,000	pounds of pilchards	
74,645,000	pounds of dehydrated potatoes	
	salmon requirements cut to 40,000,000 pounds or less than half the amount previously thought necessary.	

On August 24, the War Department announced release of 254,987 tires, costing $5,243,609, for disposal as war surplus.

The Army announced in September it had arranged to terminate its butter procurement program and that it was also going to buy chickens in the open market. Some of the contract terminations were:

cigarettes	163,135,000 packs	$8,156,750
salted peanuts	10,000,000 pounds	3,500,000
chewing gum	20,000,000 packages	600,000
cornstarch	742,500 pounds	63,855
chili con carne	6,617,702 pounds	1,200,000
candy bars	257,000,000	
frozen whole eggs		812,400
spices	1,500,000 pounds	
salt	6,000,000 pounds	
salad oil	803,000 pounds	
canned pork	60,000,000 pounds	
dehydrated vegetables	30,000,000 pounds	

Showing the value of the pre-termination-of-contract plan, the Colorado Fuel and Iron Corporation stated in September that "the consolidated pre-termination settlement agreement between the Colorado Fuel and Iron Corporation and the United States has permitted the immediate determination of all termination problems and permitted this company to clear the plant of termination inventories." Some further contract terminations were: evaporated milk 100,000,000 pounds; burlap, 5,000,000 yards; evaporated and dried fruit, 25,000,000 pounds; and miscellaneous food items, 77,000,000 pounds.

Three months after the end of hostilities, the Boston Ordnance District had completed the settlement of all war contracts, the first of the Army procurement districts to report completion of all phases of its termination job with respect to its own prime contracts, including settlement of the cancelled war contracts and clearance of plants for civilian production. Government and business, as the year ended, were working hand-in-hand to bring about speedy, economically sound return to normal, peacetime pursuits.

NAVAL CONSTRUCTION AND EQUIPMENT

By John C. Niedermair
Bureau of Ships, Navy Department

GENERAL

The situation with regard to Naval Construction and Equipment has changed materially since Aug. 14, 1945, when the Japanese gave up their attempt to rule the Pacific. Since that time there have been many cancellations of contracts, which was to be expected in view of the stoppage of war on all fronts. The state of the Navy, as reported on Aug. 15, 1945, by the Navy Department press release amply covered the situation with the statement that "World War II saw the United States Navy become the greatest seapower in the history of the world—a force so powerful it roamed wherever and whenever it desired."

The story of this giant growth was not merely one of building thousands of ships and procuring hundreds of thousands of men. It was also a story of how civilians were quickly converted into Naval officers and men for a war which accepted as commonplace such new terms as "amphibious warfare," "rocket propulsion," "radar," and "suicide" planes.

The Navy once more outfought the German submarine menace in the Atlantic. In the Pacific war, long distances were met by such new means as great floating drydocks and supply forces which refueled and replenished fleets with hardly an interruption of operations against the enemy.

The "two-ocean" Navy authorized by Congress on July 1, 1940, took form rapidly, expanding from approximately 4,500 vessels of pre-Pearl Harbor days to 91,209 vessels of all types by July 1, 1945. The Navy completed 1,265 combatant ships, including 10 battleships, 27 larger aircraft carriers, 110 escort carriers, and 45 cruisers in this same period.

To man this Navy, the July 1, 1940 personnel of 160,997 was enlarged to 3,389,000 on June 30, 1945. The Marine Corps was expanded from 28,364 to 476,709, and the Coast Guard personnel climbed from 13,766 to 171,192.

Expenditures under the Navy War Program during the five years aggregated $90,500,000,000, almost two-thirds of the $138,600,000,000 which the Navy was authorized to obligate.

The peak of commitments was reached in the first half of 1942—following Pearl Harbor—when the total was $17,100,000,000.

Naval carrier based planes stepped forth in the war as a powerful arm of the Navy, its 1944 record accounting for at least 3,291 Japanese planes, more than half of the 6,077 engaged, which were destroyed in aerial combat.

The rate of fire power of Naval guns installed on ships was increased from 411 tons of projectiles to 4,500 tons per 15-second period during the five years.

On July 1, 1945, when the war was going full blast, the Navy contemplated completing during the succeeding two and a half years an additional 2,800,000 tons of ships, including 213 combatant vessels of 1,600,000 tons.

Construction and maintenance of Navy shore facilities, civil works and advanced bases for the fleets, cost $8,100,000,000 during the five years.

FINANCE

The scope and expansion of the Navy's war program were vast, as shown by financial data embracing the Navy, Marine Corps, and Coast Guard in the five years since July 1, 1940. Appropriations and allocations to the Navy for lend-lease purposes were considered part of the Navy program and were included in the figures announced.

From July 1, 1940, through June 30, 1945, the Navy received authorizations (authority to obligate) totaling $138,600,000,000. Through June 30, 1945, commitments totaling $110,300,000,000 had been made from appropriations of $110,800,000,000, in the form of contracts, orders, project orders, signed letters of intent, and all other legal obligations, plus requisitions, unsigned letters of intent and bureau allotments. A balance of $28,300,000,000, therefore, had not been committed as of July 1, 1945.

The distribution of the program by major bureaus was as follows:

Bureau	Dollars (In Billions)	Percentage
Ships	$40.1	29%
Supplies and Accounts	29.6	21
Aeronautics	26.1	19
Ordnance	23.9	17
Yards and Docks	9.5	7
All Others	9.4	7
Totals	$138.6	100%

The difference of $27,800,000,000 between authorizations and appropriations represented $21,100,000,000 in appropriations in the Naval Appropriation Act, 1946, approved May 29, 1945, but not available for expenditure until July 1, 1945, and $6,700,000,000 in unfinanced contract authority. Funds to liquidate any obligations incurred under this contract authority would have been provided in subsequent appropriation acts.

Expenditures from July 1, 1940, through June 30, 1945, amounted to about $90,500,000,000, or almost two-thirds of the total program.

The progress of the Navy War Program may be measured by commitments (a measure of work undertaken) and expenditure (a measure of work accomplished).

The peak half-year period for commitments was reached in the first half of 1942, following Pearl Harbor, when the total was $17,100,000,000. During each of the five half-year periods following, commitments declined steadily to a low of $9,500,000,000 in the last half of 1944, despite the fact that commitments for maintenance were rising in that period.

The declining trend of total commitments was reversed during the first six months of 1945, when commitments rose to $14,200,000,000, a half-year total exceeded only by the $17,100,000,000 after Pearl Harbor. This marked reversal of trend was owing chiefly to increased commitments by the Bureau of Aeronautics and the Bureau of Ships.

Commitments under the appropriation "Aviation, Navy" of $3,600,000,000 in the first half of 1945 were five times as great as commitments of $700,000,000 in the last half of 1944. That increase reflected upward revisions in the naval aircraft production program (increased fighter plane requirements for carriers and lengthened "lead time" between placing of aircraft contracts and scheduled deliveries).

Commitments made by the Bureau of Ships in the first half of 1945 totaled $2,700,000,000, or double the $1,300,000,000 for the last half of 1944. That increase reflected the rising commitments for maintenance of an expanding fleet, together with growing procurement requirements for battle damage repairs.

The acceleration of the Navy War Program was strikingly emphasized by the increasing rate of expenditure since July 1, 1940. Starting with $900,000,000 in the second half of 1940, expenditure rose during each succeeding half-year interval, with one exception, to about $15,900,000,000 in the first half of 1945. Unusually large advances to the Army for aircraft and ordnance totaling $13,700,000,000 in the first half of 1943 exceeded the total of $12,200,000,000 for the second half of 1943.

For two and a half years expenditures had been running at a rate in excess of or equal to new commitments. During the first half of 1943, partly because of the advances to the Army mentioned above, expenditures exceeded commitments, while during the second half of 1943 the two figures were equal. During the first half of 1944 expenditures were 21 per cent in excess of commitments, while during the last half of 1944 expenditures of $14,900,000,000 were 57 per cent greater than commitments of $9,500,000,000. However, in the first half of 1945, expenditures of about $15,900,000,000 were only 12 per cent greater than commitments of $14,200,000,000, commitments having increased sharply over the total for the previous half-year.

Authorizations, appropriations, commitments and expenditures by bureaus were as follows:

Bureau	Authorizations (In Billions)	Appropriations (In Billions)	Commitments (In Billions)	Expenditures (In Billions)
Ships	$ 40.1	$ 35.2	$ 35.7	$ 29.7
Ordnance	23.9	19.0	17.1	13.3
Aeronautics	26.1	21.4	20.8	15.0
Yards and Docks	9.5	6.8	7.8	6.7
Supplies and Accounts	29.6	21.2	22.0	19.8
All Others	9.4	7.2	6.9	6.0
Totals	$138.6	$110.8	$110.3	$ 90.5

SHIPS

The "two-ocean" Navy authorized by Congress on July 19, 1940 was expanded by the demands of a global war into a fleet of five-ocean proportions by pre-war standards. On July 19, 1945, the United States had 91,209 vessels of all types, compared with the pre-Pearl Harbor fleet of about 4,500 vessels.

Expanded capacity of industry and of Navy and private yards assured the production of these vessels. At the same time, research and engineering genius built more speed and firepower into the traditional types of combat ships and developed new types to meet new problems of aerial and amphibious warfare. The hostile shores invaded and the enemy ships and planes sunk attested to the effectiveness of these new developments.

During the rapid expansion, 109,999 vessels of all types were built, acquired, or converted, including 1,265 major combatant ships displacing 4,300,000 tons. This compared with 383 major combatant ships in the fleet five years ago.

These combatant vessels included 10 battleships, four of which were of the 45,000-ton *Iowa* class; 18 aircraft carriers, all but one of which were of the 27,100-ton *Essex* class; nine small aircraft carriers of the *Independence* class; 110 escort carriers; two large cruisers; 10 heavy cruisers; 33 light cruisers; 358 destroyers; 504 destroyer escorts, and 211 submarines.

Over the five-year period, July 1940 to July 1945, the value of the Navy's new construction of all types of vessels, including Maritime Commission escort carriers, was approximately $19,100,000,000 for construction and machinery and $4,800,000,000 for armor, armament and ammunition. Combatant ships accounted for about 55 per cent of the construction and machinery cost, or $10,500,000,000, and about 67 per cent of the armor, armament, and ammunition cost, or $3,200,000,000.

Up to July 1, 1945, the Navy lost 2,003 vessels, displacing 792,000 tons and comprising 147 combatant ships, 45 minecraft, 99 patrol craft, 55 auxiliaries, 151 district craft and 1,506 landing craft, the latter composed of LSM's, LST's, LCS(L)3's, LCI(L)'s, LCI(G)'s, LCT(5) and (6)'s, LCC(1) and (2)'s, LCM(2), (3) and (6)'s, LCP(L)'s, LCP(R)'s, LCS(s) (1) and (2)'s, LCV's and LCVP's. The losses embraced one battleship (not including the *Oklahoma),* five carriers, six escort carriers, six heavy cruisers, three light cruisers, 70 destroyers, nine destroyer escorts and 47 submarines, totaling 464,000 tons.

Additional 5,346 vessels totaling 1,037,000 tons were leased to our allies. They included one light cruiser, 38 escort carriers, 92 destroyer escorts, and nine submarines, with a combined displacement of 510,000 tons. In addition, the Navy transferred more than 15,800 vessels totaling 378,000 tons, mostly small landing craft for the Army; and another 433 vessels of 132,000 tons were stricken from the Navy list.

During the next two and a half years the Navy contemplated, on July 1, 1945, completing the construction of additional 2,800,000 tons of ships, including 213 combatant vessels of 1,600,000 tons. This combatant total would consist of two battleships, nine *Essex* class carriers, three large (45,000-ton) carriers, two small carriers, 26 escort carriers, one large cruiser, 22 heavy cruisers, 19 light cruisers, 86 destroyers, five destroyer escorts, and 38 submarines. Some of these have been launched and others are practically completed. Following the surrender of Japan, a complete review was made of the status of construction and conversion program of auxiliaries, landing craft, district craft and small boats, in consequence of which the total number of cancellations was raised as follows:

Combatant ships	56
Auxiliaries	94
Landing ships	2
Patrol craft	44
District craft	121
Small landing craft	Over 8,000

ELECTRONIC DEVELOPMENTS

The most startling growth in technical developments for ships of the modern fleet was in the field of electronics, including radar and radio. Since July 1940, the Bureau of Ships awarded $4,400,000,000 in contracts for radar, radio and other electronics equipment, including equipment for the Bureau of Aeronautics, other services and lend-lease. The fact that $800,000,000 of this total had been eliminated through cancellations and adjustments, attested to the rapidity of development, with many of the cutbacks being offset by later awards for equipment of improved design.

MAJOR COMBATANT SHIPS

The total number of major combatant ships of the Navy on July 1, 1945, were: battleships, 23; aircraft carriers, 20; small aircraft carriers, 8; escort aircraft carriers, 70; large cruisers, 2; heavy cruisers, 22; light cruisers, 48; destroyers, 373; destroyer escorts, 365; submarines, 240. Vessels completed during the five-year period included: Battleships—*North Carolina, Washington, South Dakota, Indiana, Massachusetts, Alabama, Iowa, New Jersey, Wisconsin, and Missouri.* Aircraft Carriers—*Hornet, Essex, Lexington, Yorktown, Bunker Hill, Intrepid, Hornet, Wasp, Franklin, Hancock, Ticonderoga, Bennington, Randolph, Shangri-La, Bon Homme Richard, Antietam, Boxer,* and *Lake Champlain.* Large Cruisers—*Alaska* and *Guam.* Heavy Cruisers—*Baltimore, Boston, Canberra, Quincy, Pittsburgh, St. Paul, Chicago, Bremerton, Columbus* and *Fall River.* Light Cruisers—*Atlanta, San Diego, Juneau, San Juan, Cleveland, Columbia, Montpelier, Denver, Santa Fé, Birmingham, Mobile, Oakland, Biloxi, Houston, Miami, Reno, Vincennes, Astoria, Pasadena, Vicksburg, Wilkes-Barre, Flint, Springfield, Duluth, Topeka, Oklahoma City, Atlanta, Amsterdam, Dayton, Tucson, Providence, Little Rock,* and *Portsmouth.*

AVIATION

Naval Aviation's war record vouched for the quality and number of planes produced and pilots trained during the past five years. Naval aircraft sank more than half of the enemy submarines sent to the bottom by the Navy. Navy and Marine aircraft destroyed more than 17,000 Japanese planes. Against this total, fleet plane losses in combat in the Pacific were about 2,700, a combat ratio of less than one to six.

Outstanding in the destruction of Japanese planes were carrier-based aircraft. Their 1944 record accounted for at least 3,291 Japanese planes, more than half of the 6,077 engaged, which were destroyed in aerial combat. On June 19, 1944, the day of the "Marianas Turkey Shoot," American carrier planes shot down 402 enemy aircraft during the Battle of the Philippine Sea.

The extent of Naval air power was demonstrated by the fact that, on July 1, 1945, approximately 11,000 planes, including planes in pools and in transit, were deployed in the Pacific.

The average age of Navy fighter planes in the Pacific theater was cut in half during the last year. New combat planes were arriving off Okinawa within three months of leaving the factory.

Supporting the fleet, as well as Naval Aviation, the Naval Transportation Service flew nearly 77,000,000 miles in 1945.

The Aeronautical Naval Shore Establishment grew from 38 naval air stations in July 1940 to 177, with the shore construction program virtually completed. Its value increased from $250,000,000 at the outbreak of the war to $1,333,000,000 in July 1945.

Naval aviation personnel, including Marines, on July 1, 1945, totaled 750,000, of whom more than one-half were on carriers or with air groups, squadrons and fleet service units. Combat losses were consistently smaller than expected. Moreover, approximately 65 per cent of all pilots forced down were rescued or found their way to safety.

Rocket propulsion and radar improvements appeared in Naval aviation during the five years. After 12 years of experimentation in which the Bureau of Aeronautics took part, the first successful anti-blackout suit was produced for combat in 1944.

Since July 1, 1940, the strength of the Naval Air Force grew from 1,741 service planes to more than 40,000. The average weight of planes delivered increased from 2,740 pounds in 1940 to 7,140 pounds in the first half of 1945.

The Navy accepted for all users 29,800 aircraft in 1944, compared with fewer than 10,000 during the year following Pearl Harbor. About 13,500 planes were accepted by the Navy in the first half of 1945, and a similar number was scheduled for the second half. Of the 80,300 planes accepted by the Navy in the five years, lend-lease received 7,500 and the AAF more than 600. The number of Naval planes lost in the Okinawa campaign would have required eight months to produce in 1941. Those losses amounted to only 12 days' production at the July 1, 1945, rate.

During the five years, the Navy accepted 62,391 tactical combat planes valued at $6,652,116,000 and with an airframe weight of 434,994,000 pounds. Of these, 29,877 were fighters, 11,983 were scout bombers (dive), 9,207 were torpedo bombers, 174 were four-engine bombers (patrol-sea), 3,751 were two-engine patrol bombers (sea), 1,569 were four-engine patrol bombers (land), 2,776 were two-engine patrol bombers (land), and 3,054 were observation scout planes.

There were 2,002 utility and 1,063 transport planes. Training planes numbered 13,632. Miscellaneous planes, including 29 helicopters, totaled 1,194. The tactical and training planes were valued at $7,347,371,000.

ORDNANCE

The fire power of naval guns was increased from 411 tons to 4,500 tons per 15-second period during the last five years as a result of new armament on older vessels. In addition, the Navy supplied guns and ammunition for 6,050 merchant vessels and exchanged various ordnance with the Army.

Although heavy emphasis was placed upon naval bombardment, procurement by the Bureau of Ordnance reflected the constantly changing character of naval warfare. The Navy's part in amphibious operations also called for large quantities of underwater demolition equipment for use on enemy inshore defenses, and barrage rockets for reducing shore installations.

The dependence upon naval bombardment was illustrated by the firing of 36,000 tons at Guam, Saipan, and Tinian; 7,000 tons at Peleliu; 16,000 tons at Iwo Jima; and almost 50,000 tons at Okinawa.

Meanwhile, a reduction in the number of large Japanese naval vessels was reflected in lessened procurement of armor-piercing ammunition. As the fleet approached closer to the islands of Japan additional 40 millimeter guns, special fuzes for 3-inch to 6-inch projectiles, latest type mines to block enemy harbors, and new radar-controlled blind-firing directors to meet the threat of Kamikaze suicide planes were procured.

The Army was supplied with fuses, explosives, rockets, and various aviation fire control equipment, including the Nordem bombsight. In turn, the Navy procured from the Army small arms and ammunition, certain bomb fuses, other explosives, and chemical warfare and ground equipment.

Overall procurement of major ordnance items reached a peak of more than $1,600,000,000 in the second half of 1944, having risen from about $40,000,000 in the second half of 1940. Procurement of non-expendables, such as guns and gun sights, began to decline in the last half of 1944, and a leveling-off of the procurement of expendables occurred in the last 12 months to July 1945, with increased demands for rockets offsetting reductions in ammunition items and torpedoes. The growing magnitude of the rocket program was expected soon to increase total procurement of expendables to higher levels than have so far been attained.

Among new ordnance items developed by the Navy in conjunction with other government agencies and private educational and commercial research institutions were a new three-gun turret assembly for heavy cruisers, a dual purpose turret assembly for light cruisers, a dual purpose single mount for new large carriers, blind-firing gun director systems for all anti-aircraft guns of 40 millimeter caliber and larger, various new types of rockets and launchers, new types of torpedoes and mines and improved special fuses.

Under the impetus of war, the Bureau of Ordnance was expanded during the five-year period from 47 officers, and 297 civilians in July 1940 to 1,373 officers, 601 enlisted personnel, and 1,477 civilians on June 30, 1945.

Until 1940, the Naval Gun Factory at Washington, D.C. produced practically all non-expendable ordnance equipment except certain fire control items, and all ammunition was assembled at Naval Ammunition Depots. Expansion of the Navy Ordnance program required new ordnance plants, depots, and other facilities, the cost of which totaled more than $850,000,000.

The Navy's ordnance program also was supplied by approximately 1,400 prime contractors and 20,000 sub-contractors. The necessary expansion of commercial production facilities involved technical and financial assistance for many private plants. From July 1, 1940, to July 1, 1945, the value of government-financed facilities and equipment added to these plants was about $390,000,000.

YARDS AND DOCKS

Construction and maintenance of Naval shore facilities, civil works, and advanced bases for ships of the fleet, cost $8,100,000,000 during the five-year period from July 1940 to July 1945.

The protracted bombardment of industrial and military installations on the Japanese home islands by Allied fleets and carrier planes attested to the logistic significance of advance bases in keeping the Navy's ships and planes on the front lines. These bases were built and maintained by the Construction Battalions, or Seabees.

From the peak of construction activity in the second half of 1942, when disbursements reached $1,800,000,000, there was a gradual downward trend until the end of the war. Continental construction expenditures declined steadily from the first half of 1943, but were offset by a steady rise in advance base expenditures as activity near the Japanese islands increased.

Construction in the continental United States showed a nominal reduction in activity during the first half of 1945, with the value of work done declining from $320,000,000 in the previous half year to $278,000,000. The backlog of uncompleted work under contract on July 1, 1945, totaled $203,000,000, while contracts in preparation aggregated $123,000,000.

On a cumulative expenditure basis, aeronautical facilities ranked first. Shipbuilding and repair facilities were next, followed by ordnance facilities and structures for naval personnel. During the first half of 1945, ordnance facilities accounted for $125,000,000 of work done, or 43 per cent of the total expended on continental and extra-continental construction exclusive of advance base procurement.

In addition, total expenditures for "civil works" amounted to $457,000,000 as of June 30, 1944. "Civil works" comprised construction at privately operated establishments which would constitute public works or public utilities if constructed at a Navy shore establishment.

To aid prosecution of the Pacific war, the Navy constructed a total of 150 floating drydocks with aggregate lifting capacity of 1,065,000 tons. These enabled the Navy to keep its ships in fighting shape within a minimum loss of time in view of the enormous distances involved in carrying forward the Pacific offensive. Two additional 14,000-ton yard floating docks are under construction and eight other drydocks and five new sections for Advance Base Sectional Docks have been authorized.

The Bureau of Yards and Docks also originated, early in the war, standard steel cells, or pontoons. These could be assembled in a few hours for use as barges, causeways, piers, floating drydocks, floating cranes and "rhino ferries." A novel use for one of the pontoons was in moving a large floating drydock on its side through the Panama Canal. Including 148,000 delivered in the first half of 1945, a total of 520,000 pontoons was constructed. As many as 45,000 pontoons were used on one landing operation.

NAVAL PERSONNEL

To boost the Navy's personnel to the 3,388,556 officers and men in service June 30, 1945, the Bureau of Personnel had to procure 3,700,000 officers and men to maintain its strength and expand despite attrition, an average of 14,200 a week during the five years. The wartime peak represented an increase of 3,200,000 after the Naval Expansion Act of 1940 became law.

The high point in procurement was reached during the fiscal year 1943-44 when the rate of 25,000 a week was adequate to man a Navy of 1940 strength every seven weeks.

The war brought new problems to the Bureau. New plans such as advance base and amphibious warfare programs required approximately 500,000 specially-trained officers and men. Changes in strategy caused unforeseen and often immediate revisions in scheduled requirements, but the personnel to man the ships and planes was available when required. To meet this task, Great Lakes, Sampson, Bainbridge, Farragut and Memphis were added to the major training centers at Norfolk, Newport, and San Diego.

When manpower had become critical and it became evident that many billets could be filled by women, legislation was enacted July 30, 1942, to admit women to officer and enlisted ranks. Three years later, more than 82,000 of these women were serving in the continental United States and at certain overseas bases.

Including the Navy, Coast Guard, and Marine Corps, personnel strength increased from 203,127 on July 1, 1940 to 4,036,457 on June 30, 1945. On June 30, 1943, the total was 2,207,720 and a year later the figure was 3,623,205, an increase of almost 1,500,000.

Officers and men in the regular Navy on June 30, 1945, totaled 378,263, and the reserves amounted to 3,010,293. Of the officers on that date, 48,226 were of the regular Navy and 269,090 were reserves.

The Navy's civilian employee rolls climbed from 124,498 on July 1, 1940, to 752,886 on June 30, 1945. The largest single group was composed of the 332,430 employed in navy yards. In this category there was a slight decline, as 346,943 were employed in navy yards on June 30, 1944.

UNITED STATES COAST GUARD

The United States Coast Guard, 155 years old and under the operational control of the Navy since Nov. 1, 1941 (until January, 1946), greatly expanded its normal peacetime functions and enlarged its operations to include naval duties especially suited to its personnel and facilities.

Personnel increased from 13,800 to 171,200, including 9,700 SPARS. Of the total, 97,900 were assigned to Coast Guard units, 66,600 to Navy units, and 6,700 to Army and Marine Corps units. Nearly 51 per cent of the male personnel was afloat.

To the 1,400 vessels on hand before the war were added 4,052 vessels. After decommissioning of more than 2,000, the service had 3,174 vessels, excluding pulling boats, as of July 1, 1945.

The Coast Guard played an important role in convoy and patrol work, manning of Army and Navy vessels, ice operations, port security, Merchant Marine inspection and discipline, aircraft patrol, and amphibious operations. Its men participated in every important landing operation and trained others in the handling of landing craft.

By executive order the Coast Guard, early in 1942, was assigned the protection of ports against fire, sabotage, or other wartime contingency. A related responsibility was the supervision of the handling of explosives and dangerous cargoes.

After Germany's defeat, a material relaxation took place in Port Security activity, which had entailed a maximum of 31,000 personnel ashore, 10,400 afloat, and 1,872 small craft. A unique use of some 50,000 volunteers serving as Temporary Reserves without pay featured this activity at its peak.

Coastal Picket activity, organized in 1942 to help cope with the submarine menace, involved 315 small craft manned by the Coast Guard. The Beach Patrol and Coastal Lookout to protect the coasts and prevent landing of saboteurs expanded the normal Coast Guard beach forces to approximately 23,500 men, 2,300 horses, and 2,000 dogs.

An Air-Sea Rescue Agency headed by the Commandant of the Coast Guard was established in 1944 at the request of the Joint Chiefs of Staff and by direction of the Secretary of the Navy. Plans called for the Coast Guard to man 139 vessels.

Operation of weather ships, loran, and radar beacons to guide planes and ships in war operations and the maintenance of 51 direction finder stations were among other duties.

The Coast Guard's 24 coastal radio communications stations were augmented by five leased commercial stations handling Allied merchant vessel messages, broadcasting weather and hydrographic reports, assisting in rescue operations, and handling authorized commercial business where other facilities were lacking.

Through these and other functions, the wartime Coast Guard augmented its peacetime capacity to save lives and—in its tradition as lineal descendant of the first naval organization under the American flag—assumed the duties of combat.

THE POST-WAR NAVY

The size of the post-war Navy was indicated by the House action on Oct. 30, 1945, when, by unanimous vote, it approved a Navy which would be larger than the fleets of all other nations combined. The concurrent resolution, which provides for 4,698,000 tons of warships in support of President Truman's declaration on Navy Day that the United States Navy will remain the greatest Navy on earth, was transferred to the Senate for final action.

The resolution stated that it is the "sense" of Congress that the Navy shall consist of 6,084 combatant and auxiliary vessels and 12,000 planes. The document specifies that the 1082 combat vessels will be divided as follows:

Types of Ships	Total Tonnage
3 Large aircraft carriers	135,000
24 Aircraft carriers	650,000
10 Light aircraft carriers	117,000
79 Escort aircraft carriers	725,000
18 Battleships	665,000
3 Large cruisers	82,500
31 Heavy cruisers	403,000
48 Light cruisers	450,000
367 Destroyers	760,000
300 Escort destroyers	387,000
199 Submarines	314,000

The bill is specific only as to the combatant ships, but provides that the auxiliary ships be available in approximate numbers. In the committee's report it is prescribed that there will be 5,002 auxiliaries of all types.

The plan reduces the fleet from the wartime total of 1,308 combatant ships. One-third of the post-war fleet would be fully manned and ready for any emergency, one-third would be held in reserve and ready for action on short notice, and one-third would be in a decommissioned status but available for recommission if needed. All the ships are either already in service or are being built under Congressional authorization.

The pre-war strength built and authorized, up to and including the Naval Expansion Act approved on May 17, 1938, was only 272 ships.

WAR PRODUCTION

By J. A. Krug

Former Chairman of the War Production Board

SCOPE OF PRODUCTION

In the five years of war production from July 1, 1940, through July 31, 1945, the industries of the United States turned out a total of $186,000,000,000 worth of planes, ships, guns, and other materiel against the Axis. This is the adjusted total, expressed in dollars of constant purchasing power. At no time during the struggle did war production absorb more than two-fifths of the national output; the remaining three-fifths represented production for civilians as great as the total in peacetime 1939. The war production figures for the five years are apportioned as follows: aircraft—some $44,442,000,000; ships, Naval and Maritime—$40,694,000,000; guns and fire control—$10,801,000,000; ammunition—$19,734,000,000; combat and motor vehicles—$21,529,000,000; communication and electronic equipment—$10,659,000,000; and other equipment and supplies—$38,148,000,000.

None of these figures includes expenditures on the production of atomic bombs and other secret weapons, which rose well above $2,000,000,000.

AVIATION PRODUCTION

Aviation production during the period represents a fleet of 297,000 military airplanes and special purpose aircraft, of which 97,000 were bombers, including super-fortresses, heavy four-engine, medium-range bombers, and those of the patrol, medium, and light bomber types; 99,000 fighters of all types; 3,700 reconnaissance planes; 24,000 military transport planes; 58,000 trainer planes; 14,000 communication planes; and 2,000 special purpose aircraft.

These aircraft totals represent a total airframe weight of nearly 2,500,000,000 pounds for all military airplanes and special-purpose aircraft produced. This excludes a considerable weight of spare parts, also produced in the period.

NAVAL SHIP PRODUCTION

New naval ships built during the period totaled 71,060 vessels, aggregating 8,250,000 displacement tons. This made the United States Naval fleet more powerful than the combined fleets of the rest of the world. Subsequent to July 1940, the fleet was increased by about 15 times on a tonnage basis. (See "Naval Construction and Equipment," p. 384 *seqq.*).

MARITIME COMMISSION PRODUCTION

Construction of Maritime Commission vessels during the five-year period quadrupled the United States merchant fleet—from 11,400,000 deadweight tons to about 45,000,000 tons. This increased the Maritime fleet from about one-sixth to one-half of the world's merchant tonnage, by the addition of 5,425 vessels totaling 53,200,000 deadweight tons. Of these, more than 600 vessels totalling 2,800,000 deadweight tons were military types constructed for the United States Navy; they included 50 baby aircraft carriers, 96 frigates, and scores of combat loaders, or attack cargo and attack transport vessels. (See "The Merchant Marine," p. 596 *seqq.*).

ARMY GUNS AND AMMUNITION

The Army procured 17,400,000 rifles, carbines, and sidearms; 2,700,000 machine guns; and more than 315,000 pieces of field artillery and mortars. Artillery ammunition exceeded 4,200,000 tons; mortar shells, 377,000 tons, while aircraft bombs, Army and Navy, weighed 5,900,000 tons. More than 41,000,000,000 rounds of ammunition were produced for small arms alone. Rockets for "bazookas" exceeded 15,200,000; land mines more than 24,000,000; grenades more than 110,000,000, and flame throwers well over 38,000. Defensive equipment for American soldiers included 23,000,000 helmets and 25,000,000 gas masks.

NAVAL ORDNANCE

In mid-1940, the guns installed on ships of the U. S. "one-ocean Navy" could fire a total of 411 tons of projectiles in 15 seconds. Five years later Navy firepower had increased more than tenfold to 4,500 tons per 15-second period. The naval ship construction program was provided with modern armament without delaying new ship completions; the armament of the naval fleet existing in 1940 was also modernized, and more than 6,050 merchant vessels were supplied with guns and ammunition. Naval gun ammunition and rockets amounting to 1,347,000 tons were produced.

COMBAT AND MOTOR VEHICLES

Combat and motor vehicles produced during the five-year period include tanks, 86,388; armored cars, 16,438; scout cars and carriers, 88,077; tank chassis for self-propelled guns, 16,018; trucks, 2,434,553, of which some 244,071 were "heavy-heavy," or over 2½ tons; 757,222 light-heavy, or of 2½ tons; 442,031 medium, or 1½ tons; and 991,229 light, or under 1½ tons (mostly jeeps); and tractors, 123,707.

COMMUNICATION AND ELECTRONIC EQUIPMENT

Communication and electronic equipment produced totaled some $10,659,000,000, of which $4,455,000,000 went for radio, $3,719,000,000 for radar, and $2,507,000,000 for other communication equipment, including some 5,262,000 miles of field and assault wire.

Electronics in military production amounted to only $155,000,000 in 1941. In 1944, almost 20 times that value was produced—$2,823,000,000. Radar was hardly out of the laboratory in 1941, but $3,700,000,000 of this equipment was produced over the five-year span from July 1940 to August 1945—about two-thirds of that being achieved in the last months of the period.

OTHER MILITARY EQUIPMENT

Other military equipment and supplies produced include the following: Clothing for the Army—service combat boots, 26,344,000 pairs; field jackets, 34,308,000; wool serge trousers (olive drab), 15,273,000; woolen socks, light or heavy, 251,043,000 pairs. The Army and Navy together procured 266,000,000 pairs of cotton shorts, equivalent to nine pairs for each adult male in the United States.

Equipage (Army); wool sleeping bags, 8,405,000; wool blankets, 43,270,000; squad tents, 754,000; half shelter tents, 24,609,000.

Medical supplies (Army); atabrine tablets, 4,715,620,000; sulfadiazine tablets, 1,412,506,000, and sodium penicillin (100,000 Oxford units) 11,835,000 ampules.

CONSTRUCTION AND FACILITIES

Excluding the $15,000,000,000 spent to equip the new plant, actual industrial construction in the five years from mid-1940 to mid-1945 accounted for less than $10,000,000,000 out of more than $40,000,000,000 of new construction. Direct military construction —camps, depots, barracks, air bases, and so on, ran above $10,000,000,000 or more than industrial facilities.

Despite high total construction in the early war years, this period revealed a substantial accumulation of construction demand. In many construction fields—highways, other public works, commercial buildings, and public utilities—for example, large numbers of projects had to be deferred because they could not demonstrate wartime essentiality. Much of the war housing, plant construction, military construction, and other building served only a temporary need and had to be abandoned when the fighting was over. Thus the beginnings of a new expansion in construction had become evident by the fourth quarter of 1945.

After VE-Day, a number of minor upward revisions of the dollar limitations in the construction order L-41 were made. The permitted value of work on residences and farmhouses was increased from $100 to $500; on commercial buildings to $5,000; and on industrial buildings to $25,000. Shortly thereafter all limitations on highway construction were removed. After VJ-Day, all dollar limits on industrial construction were eliminated, and the remaining restrictions in L-41 were revoked effective Oct. 15. At that time, tentative estimates projected a construction activity of $4,500,000,000 in 1945, rising to $6,500,000,000 in 1946. This last figure was revised upwards to $7,500,000,000 later in the year.

LEND-LEASE AND FOREIGN TRADE

In a little over four years, from March, 1941 to July, 1945, the United States had transferred under lend-lease goods valued at more than $37,000,000,000, besides rendering some $4,500,000,000 of service to the Allies. Shipments included almost $21,000,000,000 of industrial materials and products, and $6,000,000,000 of foods and other agricultural products.

The War Production Board was responsible for production for both domestic and export use, and the final determinations as to what could be produced for each were made in the WPB Requirements Committees. These determinations, however, were of necessity governed by the international policy of the country, and control was maintained with the assistance of the Foreign Economic Administration and predecessors, through preference ratings assigned within quotas to lend-lease requisitions and export licenses.

Beginning early in 1942, the Combined Raw Materials Board, the U. S. member of which was also a WPB representative, began to allocate between the United States and the United Kingdom, and among other allied nations, the world supply of critical raw materials available to those countries. To implement these allocations, the War Production Board issued its import control order M-63, which served also to regulate imports in respect of the available shipping space.

Under an early wartime authority, stocks were accumulated of such raw materials as manila fiber, block mica, quinine, tin, and rubber which prevented what might have been a disastrous shortage during the war. Stockpiling and public purchase programs under WPB directives covered more than 260 commodities, imported and domestic. With the end of the fighting, the total was reduced to about a dozen, chiefly involving subsidy payments and such scarce raw materials as cordage fibers, lead, natural rubber, tin, hides and skins. During the transition period, the War Production Board and its successor, the Civilian Production Administration, continued to assist urgent foreign procurement programs through expediting action. In special cases it provided priorities assistance in advance of procurement.

THE ATOMIC BOMB

The job of the War Production Board in the development of the atomic bomb was primarily to assist other programs, essential to maintaining the immediate flow of munitions to the battlefronts, whenever the overriding priorities of the Manhattan District Project (camouflage name of the atomic energy project) got in their way. Only occasionally was it called on to give the atomic bomb itself any assistance other than the blanket priority it had been granted. These conflicts with programs of immediate urgency were felt at one time or another in virtually all of WPB's industry divisions, when producers' order boards were disrupted and carefully timed program deadlines set back by the Manhattan District demands for materials and equipment in exceedingly tight supply.

It was the job of the WPB Special Rating Division to resolve these conflicts, a task made infinitely harder by the secrecy surrounding the atomic bomb operations. Only a handful of men in the WPB knew what the project sought to accomplish; no one could talk about its operations while they defended its extreme urgency.

Many other WPB divisions aided the completion of the project. In virtually all scheduling, programming, and allocation of materials components and end products, Manhattan was given 100 per cent of its stated requirements. Uranium supplies and uses were carefully controlled by the Miscellaneous Minerals Division through M-285 and through allocation of all imported uranium. The Urgency Rating Committee gave it top priority from the start, and it appeared at the head of every issue of the National Production Urgency List, which determined priority in local labor referrals. In total, these measures speeded by months the brilliant success of the first atomic bombing of Japan and thus helped bring the war to an earlier conclusion.

ELECTRIC POWER

Paced by such insatiable new consumers of electric energy as the atomic bomb plants, aluminum, magnesium, synthetic rubber, and the cross-country pipe lines, demands for electric power jumped from 161,300,000,000 kilowatt hours in 1939 to 279,500,000,000 kwh in 1944, an increase of 73 per cent. In the same period, generating capacity of the nation's power plants was allowed to increase by only 26 per cent—from 49,400,000 to 62,000,000 kilowatts.

At no time during the war was it necessary to curtail power consumption because of insufficient supply. The United States ended the war with lights burning, with every machine fully powered, and with electric energy to spare, yet the power companies, relieved of their tremendous war burden, were then planning to spend $1,500,000,000 in the following 18 months for construction and equipment needed to carry the reduced peacetime load.

The wartime feat was made possible by a pooling arrangement. Under WPB direction, the power industry virtually realigned its historical pattern of production and distribution. All the nation's power systems—private, municipal, county, state, and Federal—were, in effect, assembled in great operating pools. Normal competitive development was halted. When it best served the effort, some operators had to turn the job of supplying power to customers in their service areas over to competing firms, while their own plants shoved across state lines to distant war plants. This integration was accomplished under Limitation Order L-94, adopted in September 1943. For example, all the power systems in Tennessee, Alabama, Georgia, Florida, North Carolina, South Carolina, and Kentucky were tied together and operated as a single network. This network, through an inter-tie at Memphis, was linked with the great power pool in the Southwest, embracing the utilities of Oklahoma, Kansas, Arkansas, Texas, and Louisiana. Similar integrated pools were established in the Pacific Southwest, Pacific Northwest, Middle West, New England, and the Middle Atlantic States.

Four days after VE-Day, the Office of War Utilities of WPB paved the way for a start on the large dammed-up program for rehabilitation and expansion of power plants and transmission systems. The power companies made it clear at that time that when construction was entirely open-ended, they planned to continue expanding at the rate of $1,200,000,000 a year. Order L-94 was revoked in August, but OWU urged power companies in areas of short supply to continue their pool interchanges at least until new equipment could be completed and placed in operation. The surrender of Japan brought a sharp decline in power demands. By the end of September the weekly rate of power output had dropped by 300,000,000 kilowatt hours. However, the downward trend was expected to reverse itself during 1946, and the utility companies anticipated that power demands in 1947 would be even heavier than those made during the war years.

STEEL

The military cutbacks announced just before and just after VE-Day opened a prospect of an easier position in supply and requirements of steel. A start was made toward lifting end-use restrictions. Controlled Materials Plan authorizations were provided for essential programs only. Limitations and conservation orders had been relaxed, and new non-military consumption could be supplied by whatever "open-end" steel might be available after taking care of CMP orders.

Meanwhile the carry-over of past-due orders of sheet and strip had risen dangerously. The mills were plagued by manpower shortages. Such reduced requirements as developed in some military programs were offset by mounting Pacific war requirements in others. The bulk of increases authorized for essential civilian programs centered in farm machinery, trucks, freight cars, refrigerators, washing machines, which required much sheet steel.

Intensive efforts were at once directed toward clearing space on sheet and strip mill schedules, but with the advent of VJ-Day, military programs were so drastically cut back that the crisis was quickly ended. CMP was terminated at the end of the third quarter. Inventory restrictions were retained in order to forestall hoarding, and a few limitation orders were kept for special purposes. Finally, a simplified priorities system with two ratings was instituted, the first to protect military orders of high urgency and the second to break reconversion bottlenecks; otherwise, steel was completely free of wartime control. For 1946, finished steel demand was estimated to be in the neighborhood of 58,600,000 tons, or some 2,600,000 tons below estimated first-line production capacity, excluding high-cost capacity.

COPPER AND COPPER ALLOY PRODUCTS

As the copper supply became easier, controls were gradually relaxed during 1945 until May, when the order prohibiting its use in non-essential civilian items was revoked. After July 1, CMP was "open-ended," and copper became available for unrated orders. With the termination of the Controlled Materials Plan, all restrictions on the use of copper and its alloys were removed.

Expansion of the wire mill industry had been necessitated by the Navy and Maritime shipbuilding programs. As late as January, 1944, requirements for communication wire were running at less than 90,000 miles a month, but with the approach of the Normandy invasion, requirements jumped sharply and reached a peak of 270,000 miles by May, 1945. This program required erection of a $5,000,000 plant at St. Louis and the installation of several hundred seven-wire stranding machines which were of little value in post-war civilian production. Special facilities also had to be acquired for production of Navy shipboard cable, which has virtually no commercial use. However, a number of other expansions, chiefly those required for the use of synthetic rubber and plastics to replace natural rubber in cable coverings, were of permanent use.

During the war years, foundry capacity as a whole was sufficient to meet the demands placed upon it, although production had to be increased from a pre-war average of 250,000 tons to 786,000 tons in 1944. New facilities costing nearly $10,000,000 were built, largely to cope with specialized orders and to meet transportation and manpower problems. The 1945 capacity of the industry exceeded probable post-war requirements for foundry products.

ALUMINUM

The war history of aluminum is the record of a successful race to expand facilities fast enough to meet the multiple increases in military requirements, chiefly for aircraft. At the end of the war, with all controls lifted, the industry was faced with surplus capacity, surplus stocks, and surplus scrap. In 1938, the annual capacity of the single United States producer of primary aluminum was 300,000,000 pounds. The total fabricating facilities in the country were barely able to process the available metal. When the wartime expansion program was completed, installed ingot capacity was 2,300,000,000 pounds per year; secondary recovery had increased sixfold; and the fabricating system had an annual machine capacity of 2,600,000,000 pounds. As a result of this huge expansion, both private and government financed, approximately 42 per cent of the world's total installed primary capacity is now concentrated in the United States, and the domestic fabricating system is by far the largest in the world. By even the most optimistic estimates of postwar demand, 50 per cent of United States capacity is surplus for commercial operations, and the potential effects on the world industry resulting from ultimate disposition of government-owned facilities are far-reaching.

RECONVERSION

Reports for the four months through July, 1945, from a large number of capital goods producers, showed that shipments to civilian users were above 1939 rates in such lines as mechanical power transmission equipment, machine tools, metal working machinery, food products machinery, pumping equipment and air compressors, and mining machinery and equipment, by margins ranging from 10 per cent and more. Industries in this position had only sales volume and prices, not production problems, to worry them in the reconversion period.

For the capital equipment group as a whole, it was estimated that production of civilian-type products dropped about 10 per cent in August as military orders were cancelled. Civilian orders, however, had already begun to take up the slack, and the industry's own expectation based on a sample survey, was that it would be operating at 234 per cent by mid-1946.

A survey of a large representative group of manufacturers in 14 of the principal metal consumer goods manufacturing industries—passenger autos, stoves, refrigerators, watches, vacuum cleaners, washing and ironing machines, sewing machines, bicycles, and so on—was made in September 1945, to determine the manufacturers' own expectations of their rate of reconversion. With one exception, these industries indicated that by June, 1946, every one of the 14 expected to be producing more goods than before the war, beginning to satisfy the accumulated demand of the war years. In a few industries—domestic water heaters, watches, washing and ironing machines, electric ranges, oil burners, and electric fans—the companies surveyed foresaw markets more than double those of pre-war years.

The survey revealed two other striking facts. First, in a number of these industries, the smaller firms were counting on increasing their share of the market; they predicted substantially larger percentage increases than the big companies. Many of these smaller companies had greatly expanded and modernized their productive capacity as a result of large war contracts; they expected to make aggressive use of these new facilities in a period when old brand preferences might be latent or forgotten. Second, each of these industries expected a higher output per employee than before the war.

CIVILIAN PRODUCTION ADMINISTRATION

With disbandment of the War Production Board on Nov. 3, 1945, the newly appointed Civilian Production Administration took over the remaining functions, powers, duties, and personnel of the WPB, with John D. Small as Administrator. The new organization retained a hard central core of the older body, with the understanding that the other men of WPB would stand ready to return at short notice to meet any emergency which might arise during the difficult task of reconversion.

Five operating bureaus, namely, of Reconversion Operations, Priorities, International Supply, Field Operations and Demobilization, assumed the following functions for the period of orderly transition from wartime industrial production to maximum peacetime production free from war controls, and with due regard for the stabilization of prices and costs: 1. Use of authorized powers to expand production of materials which were in short supply; 2. Limiting the use of materials which were still scarce; 3. Restricting the accumulation of inventories so as to avoid speculation, hoarding, and unbalanced distribution which would curtail total production; 4. Granting priorities assistance to break "bottlenecks" which threatened to impede the reconversion process; 5. Facilitating the fulfillment of relief and other essential export programs; 6. Allocation of scarce materials or facilities necessary for the production of low-priced items, such as the low-cost clothing program, essential to the continued success of the stabilization program; and 7. Implementation of the President's moderate-cost housing program, with veterans' preference in occupancy.

ADMINISTRATION OF VETERANS AFFAIRS

BY OMAR N. BRADLEY

GENERAL, U. S. A.; ADMINISTRATOR, VETERANS ADMINISTRATION

ORGANIZATION

As of June 30, 1945, the organization of the Veterans Administration consisted of the following officers: Frank T. Hines, Administrator of Veterans Affairs; Adelbert D. Hiller, Executive Assistant to the Administrator; Harold W. Breining, Assistant Administrator in charge of finance and insurance; Omer W. Clark, Assistant Administrator in charge of compensation, pension, vocational rehabilitation and education; George E. Ijams, Assistant Administrator in charge of medical and domiciliary care, construction and supplies; Edward E. Odom, Solicitor in charge of legal activities; and Robert L. Jarnigan, Chairman of the Board of Veterans' Appeals. On June 7, 1945, President Truman appointed Gen. Omar N. Bradley to succeed Gen. Hines as Administrator of Veterans Affairs, and Gen. Bradley assumed that post on Aug. 15, 1945.

INSURANCE

The United States Government life insurance fund is a trust fund administered by the Government as trustee for the sole benefit of the policyholders. The Government derives no profit whatever from the administration of this fund as it may be used only for the payment of claims under United States Government life insurance contracts and as dividends to the policyholders themselves. All premiums paid by the policyholders, all interest received from policy loans, investments, etc., are covered into this fund in the United States Treasury.

At the close of the fiscal year 1945 there were in force 567,934 United States Government life (converted) insurance policies amounting to $2,454,855,781 insurance. During this fiscal year 439 policies amounting to $1,600,792 insurance were reinstated. Monthly payments, averaging $35.10 were being paid to 10,841 permanently and totally disabled veterans. During the fiscal year ended June 30, 1945, there were approved 2,743 applications aggregating $16,857,362. The actual disbursements made from this fund during the fiscal year 1945 totaled $32,273,258.28.

Yearly renewable term insurance was granted to all veterans of the First World War who made application for this form of benefit within 120 days after induction into service. The amount of term insurance was limited to $10,000 for each veteran. Monthly payments on term insurance policies are based on $5.75 per $1,000 of insurance in force at such time as award for disability or death is made. As of June 30, 1945, monthly payments were being made to 9,301 permanently and totally disabled veterans and to the beneficiaries of 2,042 deceased veterans.

Automatic insurance was granted to those veterans of the First World War who were disabled or to the beneficiaries of those who died within 120 days after being inducted into service and before application for term insurance was made. The amount of automatic insurance was limited to $5,000. As of June 30, 1945, monthly payments were being made to 215 permanently and totally disabled veterans and to the beneficiaries of 11 deceased veterans. These payments are fixed by law at $25 per month.

The disbursements for term and automatic insurance during the fiscal year 1945 totaled $19,756,071.97, including $12,941,477.28 transferred to the United States Government life insurance trust fund for cases traceable to extra hazards of military or naval service, making a net disbursement of $6,814,594.69.

The National Service Life Insurance Act, approved Oct. 8, 1940, authorized the issue of a new type of insurance to certain persons then in the active service of land and naval forces (including Coast Guard) and those thereafter entering on active duty, including persons inducted under the Selective Training and Service Act of 1940. The insurance was available to those persons then on active duty, and if in good health, upon application made within 120 days from the date of the approval of the act. As to those who entered service after that date, application must be made within 120 days from date of entry into service. This insurance is limited to $10,000 for each veteran and is payable only in the event of death of the insured while the policy is in force. During the fiscal year 1945 there were approved 2,206,813 applications aggregating $20,398,204,000 of insurance. The total number of applications, approved to June 30, 1945, was 17,492,388 amounting to $135,021,405,000 of insurance. Benefits had been awarded on June 30, 1945 in 223,626 cases on insurance valued at $2,039,255,100. The average contract insurance in force at the time of the veteran's death was $9,191.42. Widows were the sole beneficiary in 22 per cent and parents in 68 per cent of the awarded cases.

Commercial Insurance Guarantee.—An act to promote and strengthen the national defense by suspending enforcement of certain civil liabilities of certain persons serving in the military and naval establishments, including the Coast Guard, was approved Oct. 17, 1940. Article V of the act provides that the Government will, on application of the insured, guarantee to commercial insurance companies premiums on insurance carried with such companies by persons in active service. Through June 30, 1945, 103,227 applications for insurance benefits under this act had been received, of which 87,037, representing $216,993,141.30 insurance, had been approved, and 14,793, representing $34,090,135.15, had been disapproved.

GUARDIANSHIP

The Veterans Administration maintains supervision of all guardianship activities for incompetent veterans and minor beneficiaries. An effort has been made to utilize so far as possible the services of relatives as guardians of the person and the services of banks and trust companies as guardians of the estate of wards. As of June 30, 1945, the total guardianship load was 87,346 wards of whom 45,097 were incompetents and 42,249 minors. The value of estates of all wards approximated $163,158,552.78 on June 30, 1945.

PENSIONS AND COMPENSATION

Yellow Fever Experiments.—An act approved Feb. 28, 1929, recognized the high public service rendered by Major Walter Reed and those associated with him in the discovery of the cause and means of transmission of yellow fever. This act, in addition to establishing a roll of honor, granting medals, etc., authorized a monthly payment of $125 to each of 17 designated persons during the remainder of their lives. As of June 30, 1945, six persons were receiving this benefit. The disbursements for this type of benefit during the fiscal year totaled $9,375.

Revolutionary War.—The last pensioner was Daniel F. Bakeman who died at Freedom, New York, April 5, 1869, at the age of 109 years. The last widow of a veteran to receive pension was Esther S. Damon of Plymouth County, Vermont, who died Nov. 11, 1906, at the age of 92 years.

War of 1812.—Hiram Cronk the last veteran pensioner died May 13, 1905, at Ava, New York, at the age of 105 years. The last widow of a veteran to receive pension was Caroline King of Cheektowaga, New York, who died June 28, 1938, at the age of 89 years. As of June 30, 1945, the sole remaining pensioner was Esther Ann Hill Morgan, of Independence, Oregon, a dependent daughter of John Hill, deceased, private, Clark's and McCumber's Companies, New York Militia. Mrs. Morgan was born March 9, 1857, and receives $20 a month by special act of Congress.

Mexican War.—This war ended May 30, 1848. The last veteran pensioner was Owen Thomas Edgar, an apprentice on board the *U.S.S. Potomac, Experiment, Pennsylvania,* and *Alleghany,* U. S. Navy, who died Sept. 3, 1929, at Washington, D. C., age 98 years. On June 30, 1945, pensions were being paid to 54 widows and one child of veterans of this war. Disbursements made during the fiscal year 1945 totaled $31,129.24.

Indian Wars.—On June 30, 1945, pensions were being paid to 1,115 veterans. The average age of these veterans was 82 years. Disbursements during this fiscal year totaled $955,573.20. As of June 30, 1945, pensions were being paid to the dependents of 2,673 deceased veterans. The number of dependents totaled 2,709, classified as follows: widows, 2,647; children, 52; and others, 10. Disbursements during the fiscal year 1945 totaled $1,305,867.10.

Civil War.—Out of a total of 2,213,365 who served in the Union forces in the Civil War which terminated 80 years ago, pensions were being paid to 229 veterans on June 30, 1945. The average age for this group was 98 years. Disbursements during this fiscal year totaled $328,846.77. On June 30, 1945, pensions were being paid to dependents of 24,521 deceased veterans. The dependents totaled 24,681 and were classified as follows: 22,900 widows and remarried widows, and 1,781 children. Of the 24,521 cases, there were 3,236 cases in which the monthly payment was $30; 18,184 cases in which the beneficiary received $40 per month as provided by law for widows of the attained age of 70 years, and 217 in which $50 per month was being paid to widows who were the wives of veterans during their service in this war. There were 2,151 cases in which dependents were in receipt of pensions under Special Acts of Congress, and 733 in which the dependents were being paid pensions under general laws because of the death of the veteran from causes owing to military service, Disbursements during the fiscal year 1945 totaled $11,544,251.06.

Spanish American War.—On June 30, 1945, pensions were being paid to 128,104 veterans. Of this number 127,203 were receiving pensions for disabilities of nonservice origin or for age, 840 for service-connected disabilities, and 61 were special act cases. A study of the age of these pensioners shows that 89 per cent are between the ages of 60 and 75 years as of the above date. Disbursements during the fiscal period amounted to $111,313,837.15. As of June 30, 1945, pensions were being paid to the dependents of 71,955 deceased veterans. The number of dependents totaled 76,213 classified as follows: 70,526 widows, 5,520 children, 162 parents, and five others. During the fiscal year 1945 the amount paid to these dependents totaled $31,483,634.89.

Regular Establishment. — As of June 30, 1945, the number of veterans receiving pensions as a result of disabilities incurred in service in time of peace totaled 42,925. The disbursements for this group during this period totaled $18,737,740.79. On June 30, 1945, pensions were being paid to the dependents of 13,666 deceased veterans whose death was determined to be the result of disease or injury originating in line of duty in the military or naval service in time of peace. The number of dependents receiving pensions as of June 30, 1945, totaled 20,046, consisting of 6,479 widows, 5,470 children, 8,087 parents, and 10 others. Disbursements during the fiscal year 1945 totaled $6,162,021.55.

First World War.—*Veterans, service-connected.*—During the fiscal year 1945, the number of veterans receiving compensation for disabilities directly or presumptively connected with service totaled 332,628. An analysis of the major disabilities for which this compensation is being paid discloses that neuropsychiatric diseases are the disabling cause in 19.6 per cent of the awards, tuberculosis in 15.3 per cent, and general medical and surgical conditions in 65.1 per cent. During the fiscal year 1945, the amount of $180,349,901.86 was paid to veterans with service-connected disabilities.

Veterans, Nonservice-connected.—As of June 30, 1945, pensions were being paid to 90,477 totally disabled veterans whose disabilities were not of service origin. Of the veterans on the roll 37 per cent were over 55 years of age. Disbursements during the fiscal year 1945 totaled $53,061,553.55.

Emergency, Provisional, Probationary, or Temporary Officers.—As of June 30, 1945, there were 2,550 officers entitled to retirement pay, of whom 2,453 were receiving full pay and 31 partial pay. In the remaining 66 cases, there was a complete forfeiture of retirement pay owing largely to the fact that the officer was employed by the government at a salary in excess of $3,000 per annum. Disbursements during the fiscal year 1945 totaled $4,084,049.12. Of the 2,550 officers entitled to retirement pay 2,466 served in the Army, 68 in the Navy, and 16 in the Marine Corps.

Deceased veterans, service-connected.—On June 30, 1945, compensation was being paid to the dependents of 84,416 veterans who died in service or as a result of diseases or injuries incurred in service. These dependents totaled 108,184 and were classified as follows: 30,560 widows, 16,012 children, and 61,612 parents. Disbursements during the fiscal year 1945 totaled $50,019,402.78.

Deceased veterans, nonservice-connected.—An act approved June 28, 1934, as amended July 19, 1939, authorized the payment of compensation to the widows and children of deceased veterans who at the time of death were suffering from a disability of service origin but who died as a result of a disability not incurred in service. On Dec. 14, 1944, this act was further amended to authorize the payment of pension if the veteran was discharged or released from service under conditions other than dishonorable after having served 90 days or more or for disability incurred in line of duty, or if the veteran was at the time of death, receiving or entitled to receive compensation, pension, or retirement pay for a service-connected disability. On June 30, 1945, payments were being made on 77,584 deceased veterans' cases, involving 73,263 widows and 75,094 children. Disbursements during the fiscal year 1945 totaled $24,729,415.

Second World War.—*Living veterans, service-connected.*—On June 30, 1945, compensation was being paid to 536,541 veterans for disabilities incurred in line of duty. The average age of these veterans was 29 with the greatest incidence of disability at age 24. Disbursements to this group during the fiscal year totaled $167,975,339.72. In addition, $7,046,348.66 was received by this group during this year for increased pension payments because of vocational training.

Living veterans, nonservice-connected.—On June 30, 1945, pensions were being paid to 543 totally disabled veterans, whose disabilities have been determined to be not caused by their military service. The average age of these veterans was 34 with the greatest incidence of disability at age 24. Disbursements to this group during the fiscal year totaled $152,846.87.

Deceased veterans, service-connected.—On June 30, 1945, pensions were being paid to the dependents of 94,463 veterans who died as the result of disease or injury originating in line of duty. These dependents received a total of $60,058,586.30 during the fiscal year 1945.

Deceased veterans, nonservice-connected.—The acts of May 27, 1944, and Dec. 14, 1944, extended to widows and children of deceased Second World War veterans the benefits provided by the act of June 28, 1934, as amended, based on First World War service, except that in Second World War cases, pension is payable only if

the veteran had a service-connected disability at the time of his death for which pension would be payable if 10 per cent or more in degree. On June 30, 1945, payments were being made on 164 cases involving 153 widows and 166 children. Disbursements to these dependents during this fiscal year amounted to $66,418.66.

Retired Officers of the Army of the United States (except regulars).—On June 30, 1945, there were 9,097 reserve officers entitled to retirement pay for service-connected disabilities as provided under Public 18, 76th Congress, approved April 3, 1939, and Public 262, 77th Congress, approved Sept. 26, 1941. In 55 cases retirement pay had been forfeited. Disbursements during the fiscal period totaled $10,174,646.32. The average age of the 9,097 officers was 36 years and 9,061 of the total had service in the Second World War.

Grand Total—Pensions and Compensation. — The preceding table shows the number on the rolls as of June 30, 1945, and the net disbursements during the fiscal year 1945 from the appropriation "Army and Navy Pensions."

VOCATIONAL REHABILITATION AND EDUCATION

During the year ended June 30, 1945, an expanding program was carried on under the provisions of Public Law 16, 78th Congress, approved March 24, 1943, for eligible disabled veterans with handicaps removable by training; also the first year of a program of education and training under the provisions of Part II, Public Law 346, 78th Congress, approved June 22, 1944, for eligible nondisabled veterans in need of educational or occupational readjustment. As of June 30, 1945, 22,232 veterans had entered into training under Public 16. Of these, 14,986 were still in training, 5,013 had interrupted training, 1,469 had discontinued training, and 764 had been rehabilitated. Under Title II, Public Law 346, 22,335 veterans were in training on June 30, 1945, and 990 veterans had completed courses of education or training.

HOSPITALIZATION

On June 30, 1945, the Veterans Administration was operating hospital facilities at 97 locations in 45 states and the District of Columbia. The total number of beds in these facilities was 95,211, of which 81,133 were for hospital treatment and 14,078 for domiciliary care. In addition, 5,438 hospital beds in other government hospitals were being utilized.

On June 30, 1945, the hospital load was 71,439 patients. Of this number, 71,229 were United States veterans, classified by service as follows: First World War, 44,788; Second World War, 20,774; Spanish American War, 2,793; Civil War, 8; all other wars, expeditions, and occupations, 41; Regular Establishment, 2,825. Other hospital patients included 47 allied veterans of the First World War and 163 miscellaneous beneficiaries. Of the 71,229 United States veterans, 47,892 or 67.24 per cent were receiving treatment for disabilities not of service origin. There were 66,818 United States veterans in facilities controlled by the Veterans Administration, 2,958 in other government hospitals, and 1,453 in state or civil institutions. Of the patients in hospitals June 30, 1945, 62.54 per cent were receiving treatment for neuropsychiatric diseases, 27.95 per cent for general medical and surgical conditions and 9.51 per cent for tuberculosis. Admissions during the fiscal year 1945 included 241,013 United States veterans, 2,981 admissions of other patients, 130 allied veterans, 1,939 persons in active military or naval service, and 912 miscellaneous beneficiaries. Of the 241,013 United States veterans, admissions were authorized for 13,979 for observation and treatment of pulmonary tuberculosis, 25,492 for psychotic or mental diseases, 19,973 for other neurological disorders, and 181,569 for general medical and surgical conditions.

During the fiscal year 1945, there were 306,251 United States veterans under hospitalization. Of this number, 235,022 were discharged after an average of 73 in-patient days. Patients who remained until the completion of treatment numbered 190,217 or 80.94 per cent of the total discharges.

Deaths in hospitals during the fiscal year totaled 15,488 of which 71.99 per cent occurred among patients under treatment for general conditions; 14.98 per cent for tuberculosis; and 13.03 per cent for neuropsychiatric diseases.

DOMICILIARY CARE

At the close of the fiscal year 1945 the veteran population present in domiciliary status in facilities under the control of the Veterans Administration totaled 8,779. The percentage distribution of the above veteran patients by wars were: First World War, 86.43; Spanish American War, 6.71; Second World War, 4.10; peacetime service in the Regular Establishment, 2.56; other wars, expeditions, and occupations, 0.20. An analysis of the causes of disability of these veterans shows 5,520 to be general medical and surgical conditions, 3,133 neuropsychiatric diseases, and 126 tubercular ailments.

During the fiscal year 1945,, there were 10,719 veterans admitted for domiciliary care. Of this number 8,240 or approximately 77 per cent, had served in the First World War; 1,473 or 14 per cent, Second World War; and 739, or approximately 7 per cent, Spanish American War. Approximately 90 per cent of the admissions were for nonservice-connected disabilities. Of the veterans admitted to domiciliary care during this period 68 per cent were disabled by general medical and surgical conditions, 31 per cent by neuropsychiatric diseases, and 1 per cent by tuberculosis.

During the fiscal year 1945, 15,586 veterans were discharged after an average of 6½ months' domiciliary care. Deaths among domiciled veterans during this period totaled 83, the principal causes of which were diseases of coronary arteries and angina pectoris, diseases of the myocardium and syphilis, which collectively were responsible for 63 per cent of the deaths.

The Federal Government is required to reimburse state or territorial homes for disabled soldiers in an amount not to exceed $300 per year for each person domiciled therein who is eligible for similar care in facilities controlled by the Veterans Administration. During the fiscal year 1945, an average of 4,159 such persons were cared for in these homes, thereby creating an obligation of over $1,194,353 on the part of the Federal Government.

DENTAL CARE

During the fiscal year 1945, dental care was provided for 35,111 hospital patients, 4,725 domiciliary members, and 6,371 out-patients in clinics maintained by the Veterans Administration, at an actual cost of $1,323,796. During this fiscal period, 30,402 new dentures were made and 5,429 repaired in dental clinics of the Veterans Administration. Dental treatment was authorized to private practitioners for 2,354 veterans, at a cost of $112,245, during the same period.

OUT-PATIENT EXAMINATIONS AND TREATMENTS

During the fiscal year 1945, there were 1,771,760 physical examinations for out-patient purposes made in field facilities. Of these examinations, 98.5 per cent were medical and 1.5 per cent were dental. Treatments furnished during the year for out-patient purposes totaled 828,620 of which 91 per cent were medical and 9 per cent dental.

FINANCE

The actual net disbursements from appropriations and trust funds of the Veterans Administration (including adjustments on lapsed appropriations) during the fiscal year 1945 were as follows:

ADMINISTRATION OF VETERANS AFFAIRS

Appropriations	Disbursements
Salaries and expenses	$ 158,824,748.47
Printing and binding	553,756.46
Hospital and domiciliary facilities and services, Veterans Administration	15,800,635.66
Army and Navy pensions and military and naval compensation	771,796,516.61
Military and naval insurance	19,756,071.97
National service life insurance appropriated fund	1,117,548,383.54[1]
Adjusted service and dependent pay	63,909.11
Vocational rehabilitation (First World War)	363.94[2]
Military and naval family allowance	2,346.96[2]
Vocational rehabilitation revolving fund (Second World War)	99,978.51
Soldiers' and sailors' civil relief, Veterans Administration (Second World War)	27,877.90
Penalty mail costs, Veterans Administration	180,516.30
Miscellaneous	18,066.40
Trust funds:	
U. S. Government life insurance	32,273,258.28
National service life insurance	136,846,767.35
Adjusted service certificate fund	11,223,396.84
General Post fund	96,462.50
General post fund auxiliary account, Veterans Administration	270,931.49
Funds due incompetent beneficiaries	185,223.06
Personal funds of patients, Veterans Administration	5,754,543.87
Total	$2,271,318,333.42

[1] Represents net amount transferred by voucher to National Service life insurance for payment of claims traceable to the extra hazards of military or naval service.

[2] Credit—the amount shown for the appropriation "Salaries and Expenses" includes net disbursements of $27,036.39 from allotments made to other Government agencies.

LOAN GUARANTEE ACTIVITIES

Title III of the Servicemen's Readjustment Act provided for the guarantee of loans for the purchase or construction of homes, farms, business property for any person who shall have served in the active military or naval service of the United States at any time on or after Sept. 16, 1940, and prior to the termination of the Second World War and who shall have been discharged or released therefrom under conditions other than dishonorable after active service of 90 days or more, or by reason of an injury of disability incurred in service in line of duty. As of June 30, 1945, the total applications received for guarantee of loans was 15,455. Of this number, 12,228 were guaranteed for a total of $19,644,824.90, distributed by types as follows: home loans, 11,220; farm loans, 270; and business loans, 738.

READJUSTMENT ALLOWANCES

Operations under Title V of the Servicemen's Readjustment Act, providing assistance to both unemployed veterans and those in self-employment, were begun on a nationwide basis on Sept. 4, 1944. As authorized by the act, the Veterans Administration entered into agreements with the various state unemployment compensation agencies to assume the functions of taking, processing, adjustment, and determination of readjustment allowances, and payment of allowances relating to unemployment. An unemployed veteran who has met the basic entitlement requirements is eligible for allowances providing he files a claim, registers for work, and is able to work and available for suitable work. A veteran in self-employment for profit in an independent establishment, business, trade, profession, or other vocation who has met the basic entitlement requirement is eligible for allowance providing he has been fully engaged in such employment and his net earnings have been less than $100 in the previous calendar month. A total of 180,798 veterans filed applications for determination of entitlement for allowances; 159,886 veterans submitted claims for unemployment allowances; and 15,221 filed claims for self-employment allowances. Disbursements for the fiscal year 1945 totaled $23,512,150, of which $20,123,525 represented payments to unemployed veterans and $3,388,625 payments to self-employed veterans.

IX. DEFENSE AND ARMAMENT

WATERWAYS AND HARBORS

By R. A. Wheeler
Lieutenant General, U. S. A.; Chief of Engineers, War Department

RIVER AND HARBOR IMPROVEMENTS

Federal improvement and maintenance of rivers and harbors and other waterway channels of the United States and its territories and island possessions have been prosecuted for some 120 years under the direction of the Secretary of War and supervision of the Chief of Engineers, U. S. Army, in accordance with the authorizations of Congress. In conformity with the national policy limiting wartime construction in order to conserve manpower, equipment, and materials, the new work program for rivers and harbors was restricted to improvements having direct importance to the war effort. During the fiscal year ended June 30, 1945, improvement and maintenance work was performed on 16 regular navigation projects and maintenance work was carried out on 280 projects, including the numerous coastal ports, the harbors and connecting channels on the Great Lakes, and the extensive Intracoastal Waterway and Mississippi River network, together with the operation and care of the canalized Ohio River system, Illinois Waterway, and upper Mississippi River. The Federal expenditures for new work and maintenance operations on navigation projects during the fiscal year ended June 30, 1945, were $57,145,900.96.

The principal items of new work performed during the fiscal year, other than on canals and inland waterways, included the completion of dredging the Liberty Island and Red Hook Flats anchorages, New York Harbor, to project depths of 20 feet over an area of about 160 acres, and 40 and 30 feet over an area of approximately 440 acres. Enlargement of channel facilities of New York and New Jersey channels in Arthur Kill at the bend opposite Sewaren, New Jersey, was accomplished. Ledge rock was removed to a depth of 41 feet in the west half of the channel on the Marcus Hook, Chester, Eddystone, and Tinicum ranges in the Delaware River, and dredging and rock excavation was accomplished in the Withlacoochee River, Florida, to provide a navigation channel 10 feet deep from the mouth to Port Inglis, Florida. Dredging was undertaken to provide a settling basin at the mouth of the Los Angeles River diversion channel at Los Angeles and Long Beach harbors, California.

In addition to the new work outlined in the preceding paragraph, maintenance operations were performed at important river and harbor and other waterway projects previously completed along the Atlantic, Gulf, and Pacific coasts, in the interior, and on the Great Lakes. Work was also performed on 14 projects of a river and harbor nature required in connection with the war effort by the Navy Department and other government agencies.

The 35,000 kw generating unit at the Fort Peck Dam in Montana was in operation during the major portion of the year, the amount of power generated during the year being 84,334,630 kwh. Water stored in the reservoir created by the Fort Peck Dam was released to augment the natural stream flow during low water periods to provide for navigation. The ten generating units at the Bonneville Navigation Dam on the Columbia River, Washington and Oregon, produced during the year 3,405,231,000 kwh.

INTRACOASTAL WATERWAYS

The Atlantic and the Gulf Intracoastal Waterways provide a protected channel for barge and other light-draft navigation following coastal sounds, bays, rivers, and artificial channels. This canal system, extending for more than 2,300 miles along the Atlantic and Gulf coasts, affords a channel 12 feet or more in depth throughout the Atlantic coast section from Trenton, N. J., to Jacksonville, Fla., and in the Gulf coast section from Carrabelle, Fla., to Corpus Christi, Tex.

During the past year the two floodgates at the Colorado River, Texas, crossing of the Gulf Intracoastal Waterway were completed. Dredging was undertaken in the section of the waterway between Galveston and Corpus Christi, to provide the authorized depth of 12 feet, involving the removal of some 7,000,000 cubic yards of material. Preliminary work was accomplished toward providing the authorized extension of the waterway below Corpus Christi to the vicinity of the Mexican border.

Other important coastal canals include the Cape Cod Canal, Massachusetts, and the Chesapeake and Delaware Canal which were maintained and operated in the interest of ocean-going vessel traffic.

INLAND WATERWAYS

The principal inland navigable waterways of the United States include the Mississippi River system, the Illinois Waterway, the New York State Barge Canal system, the San Joaquin-Sacramento River system in California, and the Columbia River system in the Northwest. The Mississippi River Waterway system embraces the river proper, the Red, Arkansas, Missouri, Illinois, Ohio, Tennessee, Monongahela, Allegheny, and Kanawha rivers and other streams. The Mississippi River has a channel suitable for ocean-going vessels upstream to Baton Rouge, La., and thence a channel for modern barge navigation to Minneapolis, Minn., and in its principal tributaries. The Illinois River and waterway to Lake Michigan has a barge channel which connects the Great Lakes with the Mississippi River system. Work was resumed on the construction of additional open river regulating works to improve the navigation channel in the middle Mississippi River between the mouth of the Ohio River and the mouth of the Missouri River, and also in the Missouri River below Sioux City, Ia.

The San Joaquin-Sacramento River system, which has an outlet to the sea through San Francisco Bay, provides a deep-draft channel to Stockton, Calif., on the San Joaquin River, and a moderate-draft channel to Sacramento, California, on the Sacramento River, and in addition other channel improvements. The Columbia River has a deep-draft channel to Portland, Ore., and Vancouver, Wash., and depths suitable for commercial vessel traffic to the head of the pool formed by the Bonneville Dam, and thence depths for barge navigation upstream to and including the Snake River.

These systems of inland waterways were maintained and operated during the fiscal year to provide for commerce and traffic of importance to the war, including the movement of newly-built war vessels from inland yards to the sea.

GREAT LAKES

The Great Lakes, which consist of Lakes Superior, Michigan, Huron, Erie and Ontario, have natural deep water except in the connecting channels which have been artificially deepened where necessary to accommodate deep-draft vessels. They have an outlet to the Atlantic Ocean *via* the St. Lawrence Waterway and *via* the Oswego and Erie branches of the New York State Barge Canal system and Hudson River.

During the year work was initiated on the extension to the Southwest Pier and reconstruction of Brady Pier in the St. Marys Falls Canal, Michigan. The Great Lakes harbors and connecting channels were maintained as required for the needs of commerce.

RIVER AND HARBOR AUTHORIZATIONS

The River and Harbor Act approved March 2, 1945 (Public Law 14, 79th Congress), authorized 292 new navigation projects or modifications of existing projects at an estimated total cost of $382,000,000. These additional improvements include a 12-foot channel in the Intracoastal Waterway from Jacksonville to Miami, Fla.; the improvement of the Apalachicola, Chattahoochee and Flint Rivers, Georgia and Florida; the development of the Alabama and Coosa Rivers and tributaries, Alabama and Georgia, for navigation, flood control, power development and other purposes.

Among other new projects are the Neches and Angelina Rivers, Texas, the Guadalupe River, Texas, and the improvement of the Trinity River and tributaries, Texas, for navigation, flood control and allied purposes. Also the above-mentioned act authorized the improvement of the Mississippi River between the Ohio and Missouri Rivers; the Illinois Waterway, Illinois, and Indiana Harbor Canal and Harbor, Indiana; the Missouri River between Sioux City, Ia., and the mouth; the construction of dams and open channel improvement for the purpose of providing slack water navigation on the Snake River, Oregon, Washington, and Idaho; and the construction of the McNary (Umatilla) Dam for purposes of navigation power development, and irrigation in the Columbia River, Oregon and Washington. Advance planning of the recently authorized projects is actively in progress so that construction may commence when funds therefor are appropriated by Congress.

COMMERCE

The water-borne commerce of the United States, Puerto Rico, Alaska, and the Hawaiian Islands, for the calendar year 1944 aggregated 605,928,000 tons. A total of 135,172,179 tons was carried on the Mississippi River and its tributaries, and 116,985,667 tons moved through the St. Marys Falls Canal connecting Lake Superior and Lake Huron.

During the calendar year 1944, the tonnages handled at the following ports of the United States were: Boston, 10,743,017; New York, 156,166,393; Philadelphia, 32,747,446; Baltimore, 17,651,441; New Orleans, 23,948,506; Houston, 16,956,838; Los Angeles, 19,992,843; San Francisco, 32,145,969; Seattle, 11,131,143; Duluth-Superior, 67,188,858; Chicago, 24,373,232; Detroit, 16,680,735; Toledo, 32,317,224; Cleveland, 20,526,477; and Buffalo, 23,360,759.

MISSISSIPPI RIVER SYSTEM

Works for the improvement of the channel of the river proper were continued during the fiscal year ended June 30, 1945 at various places below Cairo, Ill., and the levees built for flood control from Rock Island, Ill., to near Head of Passes, La., now extend from 484 miles above to 966 miles below Cairo which is at the confluence of the Mississippi and Ohio rivers. Below Cairo revetment was in place over 130 miles of river bank and 35 miles of permeable dikes are still in place for bank stabilization and channel regulation. The 2,500 mile levee system was substantially completed and now contains nearly 1,200,000,000 cubic yards of earth. The Bonnet Carre spillway structure was operated during the period of extreme high water in the spring of 1945. The flood control dam on the St. Francis River and two of the four planned in the Yazoo River Basin, were in operation during the spring flood. It was unnecessary, however, to operate the completed Birds Point-New Madrid floodway.

A navigable channel is available throughout the main river from Minneapolis to the Gulf of Mexico. Below Alton, Ill., the channel is maintained by open river works. In the 650 miles of river above Alton to Minneapolis, a system of low-head dams with locks provides a 9-foot channel depth adequate for modern barge navigation. The Ohio River and certain of its improved tributaries are also canalized to provide a 9-foot channel for barge navigation serving this highly industrialized region. The system of six locks and dams on the Ouachita and Black rivers provides depths of 6½ feet at low water, a distance of 351 miles, from the Red River to Camden, Ark. The Red River proper and the Arkansas River have been improved for light-draft navigation throughout a total length of more than 1,000 miles.

NATIONAL FLOOD CONTROL

Construction work on the Federal program for general flood control was begun in 1937 after the first funds for that purpose were appropriated by Congress. By the end of June 1945, 49 reservoirs and 114 local protection projects were in operation throughout the United States, exclusive of the large project authorized separately for the alluvial valley of the Mississippi River. In addition to previous authorizations, Congress, in the Flood Control Act approved Dec. 22, 1944, authorized expenditures amounting to $750,000,000 for approximately 150 additional flood control and multiple-purpose projects and for the continuation of previously approved river basin plans. With the passage of the 1944 Act, Congress has approved authorizations totaling $1,680,400,000 for the construction of about 650 reservoir and local protection projects. In the period from 1937 through June 30, 1945, funds totaling $605,742,000 have been appropriated for the prosecution of the general flood control program.

All of the authorized projects are parts of comprehensive coordinated plans for development of the river basins of the nation to provide economical flood protection and allied benefits for centers of industry and population, thousands of acres of rich agricultural lands, and vital lines of communication. In addition to their use for flood control, many of the reservoirs provide favorable possibilities for hydroelectric power generation, stream flow regulation, water conservation, recreation, and other water uses.

During the year, the Barker Dam on Buffalo Bayou, Texas, was essentially completed to provide partial flood protection for the City of Houston. The local protection projects for Tulsa, Okla., and the East Peoria Drainage and Levee District, Illinois, were essentially completed to protect those highly industrialized areas from flood damage. The improvement of the Vermilion River, Louisiana, to provide flood protection for a large agricultural area and the local protection project on the Ohio River at Jeffersonville and Clarksville, Ind., were continued during the year.

Subsequent to the cessation of hostilities in Europe, certain projects considered to be essential to the public health and safety were placed underway. By the close of the fiscal year 1945, construction had been initiated on a project for Lytle and Cajon creeks to protect the cities of San Bernardino and Colton, Calif., and vital Pacific coast railroad facilities from flood damage. Construction work on four local protection projects in the Ohio River Basin, which were suspended during the war, was resumed to provide flood protection for Evansville, Ind.; Paducah, Ky.; Portsmouth-New Boston and Cincinnati, O. The raising of existing levees along the Mississippi River between Alton and Gale, Ill., was also resumed.

The separately authorized project for the Sacramento River and its tributaries, California, will provide flood protection for cities and towns, rich agricultural lands, and railway and highway facilities of great importance to the civilian economy of the western part of the United States. During the year, construction was continued on incompleted levees along the Sacramento, American, and Feather rivers, and the clearing of obstructions was accomplished in the Butte Slough and Sutter By-passes.

Pursuant to authority provided by Congress in the Flood Control Act of Aug. 18, 1941 and in the Act of May 29, 1944 (Public Law No. 318, 78th Congress), an extensive program of emergency flood control work was undertaken to repair levees and other flood control structures damaged or destroyed by the floods of 1944 in order to restore protection to flood threatened areas. As the result of major flooding which occurred during the year on the Ohio, Missouri, Arkansas, Red, and Mississippi rivers, as well as on numerous other streams throughout the United States, Congress again enacted emergency legislation (Public Law No. 75, 79th Congress, approved June 5, 1945), to authorize the appropriation of $12,000,000 for emergency flood control work to repair levees and other flood control structures damaged by those floods. The great majority of the flood-damaged structures was constructed by local people or organizations and was of insufficient grade and section to withstand the crest stages resulting from such large floods. During the flood periods, Corps of Engineer personnel directed and carried out an effective program of flood fighting and rescue work in the threatened areas.

PART FOUR

ECONOMICS AND BUSINESS

DIVISION X

BUSINESS AND FINANCE

ECONOMIC AND BUSINESS CONDITIONS

By S. S. Huebner
Professor, University of Pennsylvania

WAR-PEACE TRANSITION

During 1945, business experienced a transition from war to peace conditions. The first half of the year was influenced by extraordinary demands for war materials, while during the latter half of the year business concerned itself primarily with a rapid reconversion to the needs of domestic consumption. The reaction from abnormal war demands, it seemed, would in all likelihood be counterbalanced by the filling of the huge backlog of much needed goods, repairs, and new construction. Serious labor disturbances, however, retarded the reconversion procedure during the last quarter of the year, with the result that 1945 production ended somewhat lower than the record-breaking years of 1944 and 1943.

MODERATE DECLINES IN BUSINESS ACTIVITIES

Taking economic barometers as a whole, moderate declines occurred along nearly all important lines of business activity. The only noteworthy exceptions, where substantial increases or improvements occurred, were the financial barometers (security market, new capital flotations, and corporate dividend disbursements), building construction, and business failures. By November, 1945, as compared with November, 1944, the iron and steel industry reported a decline of 12 per cent in iron production, of 14 per cent in steel production, and of 15.7 per cent in the rate of operating capacity for steel output. Railroad freight traffic was also smaller, total revenue freight car loadings by November being 6.7 per cent under the showing for November of 1944. Agricultural food and feed production was slightly under the record for 1944 and 1943, with the price level somewhat higher than during the previous year. The automotive industry operated during the year at an $8,500,000,000 yearly mark, as compared with a $10,000,000,000 yearly record during 1944 and 1943. Bituminous coal and lignite production showed a decline of 8.6 per cent during the first 11 months of the year, while coke output during the same period declined 26 per cent. Electric output declined about 10.6 per cent by the end of November, compared with the same month of the preceding year. Bank clearings, comparing December with December, were down by 1.6 per cent for the nation as a whole, and 7.1 per cent for the nation exclusive of New York

City. Exports for the first nine months (latest available) declined by 27 per cent, compared with the same period of 1944. Moderate declines also occurred in the production of textiles, meat packing, and the manufacture of food products, leather products, and lubricating oils, while very substantial decreases occurred in the manufacture of machinery, transportation equipment, and plate glass.

IMPROVEMENT IN FIVE BUSINESS BAROMETERS

While nearly all economic indices showed reactionary tendencies during 1945, note should be taken of five business barometers where a marked improvement occurred during the year. Building construction, as will be explained later, showed a decided upswing over the preceding dismal war years, but still remained 20 per cent under the pre-war levels of 1939 and 1940. The commercial failure situation remained excellent throughout the year. The number of business failures (first nine months as reported by Dun and Bradstreet) amounted to only 646 as compared with 980 for the same period of 1944, while failure liabilities for the first nine months totaled only $24,000,000, or about the same total as that reported for the corresponding period of 1944. Corporate dividends on listed shares on the New York Exchange (first nine months) increased 4.2 per cent over the excellent record of 1944, and the increase was distributed over nearly all of the 28 categories of stocks reported by the New York Stock Exchange. New capital flotations, as explained later, showed an approximate doubling during the year as compared with 1944, and that year in turn represented a doubling over 1943. In this connection the redemption of bonds, a very favorable factor in the financial setup of corporations, also took place at a much larger rate, the redemptions for the first nine months of the year totaling $3,483,000,000, compared with $1,362,000,000 for the same period of 1944.

BULL MARKET IN SECURITIES

Of all leading economic barometers, the security market probably presents the brightest picture. Throughout the year, in strong contrast to 1944 and 1943, this market may be described as a persistently active bull market. All leading groups of stocks participated in the rise. Combining all the leading groups of stocks, the average monthly price level experienced an appreciation of 22.3 per cent during the first ten months of the year, as contrasted with an increase of only 8.2 per cent for the corresponding period of 1944. Transactions on the New York Stock Exchange also showed an increase of 44 per cent over 1944. Gilt edge bonds continued to rise slightly beyond the exceedingly high level of 1944, the appreciation amounting to 1.9 per cent. Many factors contributed to bring about the bull market in securities during 1945, (explained under the section "The Security and Money Markets"), but uppermost seemed to be prevailing inflation thinking, the pressure of idle capital seeking investment, and the general belief in an immediate postwar boom. These factors seemed to brush aside all unfavorable influences, such as the appalling list of labor disturbances throughout the nation and the difficulties surrounding business reconversion from war to peace conditions.

AGRICULTURE

Compared with the record-breaking crop production of 1944, the 1945 crop report indicates a slightly smaller total food and feed production. The decline, however, was not enough to cause any serious shift in civilian consumption. To quote the summary of the *Guaranty Survey* (Nov. 27, 1945):

"A slight decline in general crop prospects in October brought the total indicated production to a level fractionally below the record wartime crops of 1942 and 1944, according to the Department of Agriculture. Record totals are estimated for wheat, oats, rice, sugar cane, some fruits, and truck crops; and forecasts for hay, potatoes, flaxseed, soy beans, grapes, peanuts, pecans and walnuts indicate crops not far below record totals. The corn crop is estimated at a figure slightly above three billion bushels, which is below last year's record output but far above the average for recent years.

"A conspicuous exception to the generally favorable crop situation is the cotton estimate, which is the smallest since 1921 and the second smallest since 1899. The indicated production of 9,368,000 bales is 411,000 bales below the estimate at the beginning of October and is nearly three million bales below the 1944 output. The small crop is due partly to a reduction in acreage and partly to a decline in the average yield per acre. The acre yield this year is estimated at 249.7 pounds, which is 15 per cent below the record figure for 1944 but is 8 per cent above the average for the ten years preceding."

Prices of leading farm products during 1945 showed very substantial increases along nearly all lines, except where governmental maximum price levels were established. Thus, using closing prices for agricultural commodities, quotations on Nov. 1, 1945 (*Guaranty Survey,* Nov. 27, 1945), compared as follows with prices on the corresponding date in 1944: wheat, No. 2 red winter, Chicago, per bushel, \$1.80 as compared with \$1.71⅞; corn, No. 2, yellow, Chicago, \$1.18½ as compared with \$1.07; rye, No. 2, New York, per bushel, \$1.959 as compared with \$1.271; oates, No. 2, white, Chicago, per bushel, \$.688 as compared with \$.69; and cotton, middling, New Orleans, per pound, 22.35¢ as compared with 20.10¢. The following prices may be mentioned (Babson Monthly Price Table, Nov. 1, 1945) by way of comparison with the same date for 1944: beans, domestic pea, cwt., \$6.82 as compared with \$6.85; butter, creamery, ex. (92 score), pound, \$.423 with \$.423; cheese, fancy flats, held, New York State, pound, \$.310 with \$.310; eggs, mixed colors, standards, doz., \$.461 with \$.402; flour, Spring std. patent, Minn., cwt., \$3.340 with \$3.340; lard, choice Western, pound, \$.138 with \$.138; flaxseed, cash closing, Duluth, bushel, \$3.10 with \$3.10; barley, Milwaukee, bushel, \$1.303 with \$1.23; cattle, live, weekly aver., Chicago, cwt., \$17.10 with \$16.25; hogs, live, weekly aver., Chicago, cwt., \$14.80 with \$14.65; and sheep, live, weekly aver., Chicago, cwt., \$5.10 with \$5.25.

It is interesting to note that, because of much more effective control over prices of non-agricultural commodities during the war, as pointed out by the *Guaranty Survey,* "the price level for farm products has risen nearly 115 per cent since the war began" as compared with "prices of all commodities other than farm products and foods showing a rise of only 24 per cent thus far during the present war." The further comment is made that, "while prices of farm products have risen slightly more than they did during the last war, prices of commodities other than farm products and foods have increased only one-fourth as much."

MANUFACTURING AND MINING INDUSTRIES

In these industries; price changes during 1945, as compared with 1944, were relatively small, chiefly because of governmental price levels. Comparing November, 1945, with the corresponding quotations for 1944, the following price comparisons may be selected from those listed in the *Guaranty Survey* (Nov. 27, 1945). (An asterisk sign is used wherever a maximum price was established under government regulations.) Coffee, 13⅜¢* per pound as compared with 13⅜¢*; copper, 11.87½¢* per pound as compared with 11.87½¢*; hides, 15½¢* per pound as compared with 15½¢*; pig iron, \$25.25* per gross ton as compared with \$23.50*; steel billets, Pittsburgh, \$36 per gross ton as compared with \$34; lead, 6.50¢* per pound as compared with 6.50¢*; petroleum, Pennsylvania, \$3* per barrel as compared with \$3*; rosin, \$6.76* per 100 lbs. as compared with \$5.81*; rubber, .22½* per pound as compared with .22½¢*; sugar, 3.75¢* per pound as compared with 3.75¢*; tin, 52¢* per pound as compared with 52¢*;

wool, Ohio fine delaine, $1.21* per pound as compared with $1.21*; and zinc, 8.25¢* per pound as compared with 8.25¢*.

NEW CAPITAL FLOTATIONS

Although new capital financing (as distinguished from refunding issues) doubled during 1944 as compared with 1943, the year 1945 indicates approximately another doubling as compared with 1944. The total new capital financing for the first nine months of 1945 (latest available) aggregated $812,262,000, as compared with $459,407,000, $199,680,000, and $614,069,000 for the corresponding months of 1944, 1943, and 1942, and, for the corresponding periods, with $770,000,000 for 1941, $458,000,000 for 1940, $311,000,000 for 1939, $316,000,000 for 1938, and $1,154,000,000 for 1937. It should also be noted that a considerable monthly fluctuation in new capital flotations took place during 1945. Thus, for January, February and June, the monthly totals reached only $42,741,000, $26,925,000 and $1,352,000, respectively, whereas for May and July the monthly totals reached $156,960,000 and $211,614,000.

CORPORATE FINANCING

	1944		1945	
	Capital	Refunding	Capital	Refunding
January	$ 37,773,000	$122,683,000	$ 42,741,000	$272,280,000
February	62,616,000	96,146,000	26,925,000	136,332,000
March	45,456,000	77,535,000	62,044,000	295,766,000

* Nine months.
Source: *Commercial and Financial Chronicle.* 1941–1945 figures from *Survey of Current Business.*

The total of refunding issues for the first nine months of the year also showed a huge increase, the total standing at $3,483,966,000, in contrast to the corresponding figure for the same period of 1944 of $1,362,087,000, $445,000,000 for 1943, and $296,000,000 for 1942. The 1945 figure may also be compared with the corresponding figures of $1,354,000,000 for 1941, and $1,252,000,000 for 1940. Since September, judging from press accounts, the 1945 increase in bond redemptions has continued at a rapid rate. It should be noted that the new capital and refunding totals for the first nine months of 1945, $812,000,000 and $3,484,000,000, respectively, greatly exceed the totals for all of 1944, namely, $632,000,000 and $2,423,000,000.

BANK CLEARINGS

For 1945, bank clearings fell slightly below those of 1944, although they greatly exceeded those of 1943 and 1942. The grand total for the week ended Dec. 1 (*Commercial and Financial Chronicle*), for 111 cities, was $13,395,133,009, as compared with $13,618,999,444 for the corresponding week of 1944, a decrease of 1.6 per cent. For the corresponding week of 1943 and 1942, the totals were $9,855,867,228 and $9,091,533,862, respectively. Exclusive of New York City, the nation's Federal Reserve Districts show total bank clearings for the week ending Dec. 1 of $5,304,408,391, a decrease of 7.1 per cent as compared with the 1944 corresponding week's total of $5,712,038,159. The large showing for 1945 (exclusive of New York City) also compares with $4,688,968,852 and $4,566,163,890 for the corresponding week of 1943 and 1942, respectively. The respective gains and losses for each of the 12 Federal Reserve Districts, for the week of Dec. 1, 1945, in comparison with 1944, are shown by the following table:

Federal Reserve District	1945 Millions	1944 Millions	Increase or Decrease %
First—Boston (12 cities)	512	639	−19.9
Second—New York (12 cities)	8,283	8,136	+1.8
Third—Philadelphia (10 cities)	749	828	−9.6
Fourth—Cleveland (7 cities)	612	724	−15.6
Fifth—Richmond (6 cities)	343	387	−11.4
Sixth—Atlanta (10 cities)	448	422	+6.2
Seventh—Chicago (17 cities)	741	791	−6.4
Eighth—St. Louis (4 cities)	350	362	−3.2
Ninth—Minneapolis (7 cities)	248	241	+2.9
Tenth—Kansas City (10 cities)	330	313	+5.4
Eleventh—Dallas (6 cities)	189	160	+18.4
Twelfth—San Francisco (10 cities)	590	616	−4.1
Grand Total (111 cities)	13,395	13,619	−1.6
Outside New York City	5,304	5,712	−7.1

SECURITY MARKETS

Unlike 1944 and 1943, the 1945 security market may be characterized as a distinctly active bull market. Combining all the leading groups of stocks, the average monthly price level experienced an appreciation of 22.3 per cent during the first ten months of the year, as contrasted with an increase of only 8.2 per cent for the corresponding period of 1944. Gilt edge bonds continued to rise slightly throughout the year despite their very high level at the close of 1944, showing an appreciation of 1.9 per cent as compared with a rise of 2.5 per cent during 1944.

Combining all leading groups of stocks, three distinct price trends occurred during 1945, namely, (1) a rise from January to June with monthly averages increasing from 107.1 to 119.8, or 11.8 per cent, (2) a minor decline during July from 119.8 to 117.4, or 2 per cent, and (3) a rise from August to October from 117.4 to 131.0, or 12.4 per cent (Standard and Poor's Index). By December press accounts were stressing the attainment of the stock market level to a 15-year peak. For the first ten months of the year, the following monthly average price increases occurred in the four leading groups of stocks: railroad stocks 19.7 per cent, industrials 21.1 per cent, public utilities 33.9 per cent, and coppers 21.1 per cent. The annual volume of transactions on the New York Stock Exchange also reached the large total of 377,563,575 shares, or nearly 44 per cent in excess of the 1944 total. Million and 1,500,000-share days were the general rule. Transactions on the New York Curb Market were also double the total of 1944.

Although many unfavorable factors prevailed industrially, the security market seemed, throughout the latter half of the year, to be in the grip of inflation thinking and the pressure of idle funds seeking employment. (See "The Security and Money Markets," p. 424.)

RAILROAD INDUSTRY

The year 1945 showed a somewhat smaller railroad traffic than prevailed during the preceding four years of 1944-1941, described in previous issues of THE AMERICAN YEAR BOOK for those years. Moreover, as the year progressed, the trend toward a decline became somewhat more marked. According to the Association of American Railroads (announcement Nov. 24), revenue freight car loadings during the first 11 months of 1945 totaled 38,354,861, a decrease of about 3.3 per cent when compared with the 1944 total of 39,709,213. For the same period of 1943 the total stood at 38,710,546. For the week of Nov. 24, 1945, total revenue freight car loadings fell below the corresponding week of 1944 by 6.7 per cent, and by 12.6 per cent when compared with the same week of 1943.

COAL AND COKE PRODUCTION

Production in this important industry showed a material decline compared with the record production of the previous year. From Jan. 1 to Nov. 24, 1945, (latest available) total output of bituminous coal and lignite amounted to 517,000,000 net tons, compared with 565,000,000 tons produced during the corresponding period in 1944, a decrease of 8.6 per cent. Beehive coke production from Jan. 1 to Nov. 24, 1945, totaled 4,760,000 tons, compared with 6,475,000 for the corresponding period of 1944, a decline of 26 per cent.

EXPORTS AND IMPORTS

As explained in previous years, this business barometer became badly warped by war conditions, and particularly so with reference to exports where the tremendous volume is traceable to huge shipments abroad of war materials and lend-lease commodities. Exports of merchandise for the first nine months of 1945 (latest available, *Survey of Current Business*), reached the large total of $7,796,975,000. This figure compares with exports of merchandise for the first nine months of 1944 of $10,741,746,000, of $9,107,368,000 for the corresponding period of 1943, and with annual totals of $4,022,000,000 for 1940, $3,177,000,000 for 1939, $3,094,000,000 for 1938, $3,349,000,000 for 1937, and $5,241,000,000 for the record peace year of 1929. The large decrease of $2,945,000,000 during the first nine months of 1945 as compared with the corresponding period of 1944, or 27 per cent, is no doubt attributable to the cessation of war in Europe and the Orient, with its resulting drop in the exportation of war materials.

By way of striking contrast, imports of general merchandise for the first nine months of 1945 totaled only $3,149,841,000, as compared with $2,922,906,000 for the corresponding period of 1944, with $2,448,909,000 for the same period of 1943, and with annual totals of $2,626,000,000 for 1940, $2,318,000,000 for 1939, $1,960.000,000 for 1938, $3,084,000,000 for 1937, and $4,399,000,000 for the record peace year of 1929. The enormous difference between exports and imports in 1945 ($4,647,134,000 for the first nine months of the year) clearly indicates abnormal war conditions for a substantial part of the year. It is noteworthy that shipments abroad were still so large as to make the 1945 exports for the first nine months ($7,797,000,000) exceed those for the banner peace year of 1929 ($5,241,000,000) by about 50 per cent.

AUTOMOTIVE INDUSTRY

The 1944 account explained that the war production of automotive plants reached the $10,000,000,000 yearly mark during 1943 and 1944, although exact figures of the amounts of production of various types of fighting equipment were not published for these years. According to charts published in the September, 1945, issue of *Automotive War Production*, issued by the Automotive Council for War Production, annual automotive war output (by the middle of 1945) was still in the neighborhood of $8,500,000,000. With the lifting of censorship restrictions, the industry reported in this issue, for the duration of the war, a total output of $28,970,000,000 by categories as follows: aircraft and parts, $11,245,000,000; military vehicles and parts, $8,591,000,000; tanks and parts, $3,781,000,000; marine equipment, $1,952,000,000; guns and parts, $1,590,000,000; ammunition, $908,000,000; and all other categories, $904,000,000. For the latter half of 1945, all efforts in this large industry seemed directed toward speedy reconversion to pre-war types of production, since (1) all control upon passenger automobile output was lifted on Aug. 24, (2) the War Production Board ended its wartime allocations and priority controls on Sept. 30, and (3) nearly all restrictions on oil refining operations and all quantity and quality limitations on civilian consumption of petroleum products were abolished on Aug. 17. However, the problem was greatly complicated by the serious strike situation in this industry at the close of the year.

Only estimates of 1946 production have been ventured, some of the industry's representatives estimating in August, 1945 that output of passenger cars in the following seven months would exceed 1,100,000 cars, while others expect production by the summer of 1946 at an annual rate of 4,000,000 cars. Moreover, a high production of trucks is also anticipated. According to the manager of the Truck Division of the Automobile Manufacturers' Association, truck production "should be close to the average levels of the biggest peacetime year the industry ever experienced." It was also explained by this source that full activity for several years is necessary to catch up with the accumulated demand for trucks. The present deficiency for civilian use is estimated at 2,000,000 units, whereas the peak yearly production was 891,000 trucks in 1937, and the average annual output for the past three years was only 87,400 trucks exclusive of military units.

IRON AND STEEL OPERATIONS

Although a high peacetime consumption of iron was apparently expected to fill an enormous backlog, a fairly considerable decline in iron production occurred during the later months of 1945 as compared with 1944. Much of the contraction was attributable to coal strikes which seriously affected September and October production. The first ten months production of 45,818,128 tons compared with 52,036,708 tons for the corresponding period of 1944, a decline of nearly 12 per cent.

Demand for steel has also remained unusually heavy, although coal strikes also showed their adverse affect during October and November, 1945. November output of ingots and steel for castings totaled 6,246,759 tons as compared with 7,278,719 tons for November, 1944, a decrease of slightly over 14 per cent. Operations for November, 1945, averaged 79.5 per cent of capacity, against 94.3 per cent in November a year ago, a decline of nearly 15.7 per cent.

ELECTRIC OUTPUT

According to the Edison Electric Institute, the production of electricity by the electric light and power industry of the United States totaled 4,042,915,000 kwh for the week ended Dec. 1, 1945. This output compares with 4,524,257,000 kwh for the corresponding week of 1944, thus showing a falling off for 1945 of 10.6 per cent. During all of the four months preceding Dec. 1, the weekly output for 1945 was consistently under that of 1944, the weekly decrease ranging from a minimum of 0.5 per cent to a maximum of 12.1 per cent. The output of 4,042,915,000 kwh for the week of Dec. 1, 1945, also compares with 4,560,000,000 kwh for the corresponding week of 1943; 3,884,000,000 kwh for the corresponding week of 1942; 3,976,000,000 kwh for 1941; 2,755,000,000 kwh for 1940; 1,415,000,000 kwh for the depression year of 1932; and 1,637,000,000 kwh for the prosperity year of 1929.

BUILDING CONSTRUCTION

As explained in 1944, this important industry proved exceptional in that it showed a large decrease during 1944 as compared with 1943. During the first nine months of 1945, private construction experienced a material upswing owing to the rapid recovery of activity in non-residential building. Construction financed with public funds, however, continued the decline which started during the closing months of 1942.

According to the Bureau of Labor Statistics of the U. S. Department of Labor, total construction expenditures in the United States, during the first nine months, amounted approximately to $4,077,000,000. This exceeded the total for the corresponding period of 1944 by $535,000,000, but was still 20 per cent under the pre-war levels of 1939-1940. Privately financed construction for 1945 (first nine months) amounted to $2,495.000,000 as compared with $1,769,000,000 for the same period of 1944 (an increase of 41 per cent), while publicly financed construction dropped to $1,582,000,000, a decline of 11 per cent below the first nine months of 1944. Quoting the Department of Labor's account:

"The dollar volume ($1,027 million) of private non-residential building reported during the first three-quarters of 1945 exceeded all levels for a like period of time since the prosperous twenties, except for 1937 and 1941, and accounted for four-fifths of the gain over 1944 in privately financed construction as a whole. Primarily responsible for this record was the 623 million dollars spent for industrial facilities, which was more than 2½ times the 1944 volume. Expenditures for commercial buildings followed next, rising from 79 million dollars in 1944 to 224 million in 1945, and construction of all other non-residential buildings (schools, hospitals, institutions, etc.) increased from 101 to 180 million dollars.

"Privately financed residential (non-farm) construction expenditures accounted for only 25% of all private construction activity in the period January to September, 1945, as compared with 31% in the corresponding months of 1944 and over 50% in each of the prewar years of 1939-1941. Estimates for private residential building totaled 633 million dollars in the first nine months of 1945, and 546 million dollars in 1944. During the comparable periods in the years 1939-1941 they were 1,788, 1,330, and 2,329 million dollars, respectively."

COMMERCIAL FAILURES

The 1944 account explained that the 1944 record of commercial failures represented a decided improvement over 1943, notwithstanding the fact that that year was the best on record for a long series of years. The 1945 showing was even better than that recorded for 1944, and showed a distinct continuation of the improving business failure situation during the past eight years. The number of business failures reported by Dun and Bradstreet for the first nine months of 1945 (latest available) amounted to only 646 as compared with 980 for the same period in 1944, and 2,752, 7,641, 9,299, 10,398 and 11,197 for the corresponding period of 1943, 1942, 1941, 1940, and 1939. The nine months record of 1945 (646) also compares with full yearly records of 12,836 for 1938, 9,490 for 1937, 9,607 for 1936, 12,244 for 1935, 12,091 for 1934, 19,859 for 1933, and 31,822 for 1932, the bottom year of the depression.

With respect to failure liabilities, 1945 also showed a remarkable record. For the first nine months of the year, total liabilities of failures amounted to only $24,189,000, as compared with $23,029.000, $37,097,000, $81,387,000, $106,105,000, $124,085,000, and $138,612,000 for the corresponding period of 1944, 1943, 1942, 1941, 1940, and 1939. The 1945 nine months record ($24,189,000) also compares with the following full yearly record of $31,660,000 for 1944, $45,339,000 for 1943, $100,763.000 for 1942, $136,000,000 for 1941, $167,000,000 for 1940, $168,000,000 for 1939, $247,000,000 for 1938, $183,000,000 for 1937, and $928,000,000 for 1932, the bottom year of the depression.

X. BUSINESS AND FINANCE

CORPORATE DIVIDENDS

According to the New York Stock Exchange's monthly magazine, *The Exchange,* dividends of 705 separate common stocks listed on the New York Exchange (against 676 dividend payers in 1944), for the first nine months of 1945, exceeded those of the corresponding period of 1944 by 4.2 per cent. Four hundred and seventy-six corporations paid the same dividend as in the preceding year, 178 increased their dividend distribution, and 54 paid lower dividends or suspended dividends altogether. In the aggregate, the dividend disbursement of all the stocks for the nine months ended Sept. 30 amounted to $1,537,542,000, as compared with $1,474,967,000 during the corresponding period of 1944.

The Stock Exchange's list contains 28 categories of stocks, and 1945 showed that 22 of these groups distributed larger totals than during 1944. Two of the groups remained unchanged in the amount of dividend distribution, and only three of the groups distributed a smaller dividend total. The largest gainers were, in the order of their increases: "miscellaneous," or "all other groups," with a gain of 28.7 per cent; "textiles" with a gain of 26.8 per cent; "finance" with a gain of 15.8 per cent; "amusement," 10.3 per cent; "building," 10.0 per cent; "rubber," 9.9 per cent; "United States companies operating abroad," 9.8 per cent; "shipping services," 9.3 per cent; "foreign stocks," 9.3 per cent; "paper and publishing," 9.2 per cent; "garment manufacturers," 8.3 per cent; "petroleum," 8.2 per cent; "electrical equipment," 7.8 per cent; "food," 5.3 per cent; "railroad," 5.1 per cent; "retail merchandising," 3.6 per cent; and "farm machinery," 3.3 per cent. Only three categories show losses as compared with 1944 (only one of a substantial nature), namely: "business and office equipment," 6.4 per cent; "aviation stocks," 0.7 per cent; and "tobacco," 0.5 per cent. It is also worthy of note that the steel, iron, and coke stocks showed a gain of only 0.8 per cent, but this contrasts with a loss of 1.8 per cent during the corresponding period in 1944. Commenting on its detailed report, *The Exchange* (October, 1945 issue) makes the following statement:

"Examination of individual groups of the table discloses results in dividends which grew out of the sustained corporate effort in putting the final touches on victory. These dividends gains over 1944 afford illustrations: electrical, 7.8 per cent, petroleum, 8.2 per cent, rubber, nearly 10 per cent; shipping services, 9.3. At the same time, however, other items seem to show the results of civilian consumption in directions where the war effort had passed its peak early in 1945 or even earlier. Such as: building construction, a gain of 10 per cent; finance, 15.8 per cent (in this category of stocks it would appear that distinct peace-time relaxations were making themselves felt), garment manufactures, 8.3 per cent; textiles, 26.8 per cent."

GENERAL BUSINESS INDICES

Using the industrial production figures of the *Federal Reserve Bulletin* (adjusted for seasonal variation) it appears that the record for September, 1945, (latest figures available) shows a mixed situation as regards increases or decreases in the important lines of business as compared with 1944, with decreases largely in the majority. Thus moderate increases were shown in only four leading types of industries, comparing September, 1945, with September, 1944, as follows: wheat flour production, with an increase from 113 to 126, newsprint consumption from 83 to 93, petroleum refining from 272 to 285, and tobacco products from 124 to 160. Between the same dates, exceptionally large declines were recorded in eight leading industries, mostly of the durable goods type, namely, iron and steel with a decrease from 202 to 164, machinery products from 427 to 250, transportation equipment from 695 to 308, plate glass from 165 to 79, nonferrous metals and products from 238 to 198, beehive coke from 389 to 226, anthracite coal from 129 to 114, and silver production from 57 to 42.

On the contrary, moderate changes were shown between September, 1944, and September, 1945, in seven leading industries, with a slight decline in all cases except one, namely: textiles, with a decrease from 147 to 142, manufactures of food products, from 146 to 141, leather products from 121 to 113, bituminous coal from 151 to 148, and crude petroleum from 149 to 140. The one exception referred to is lubricating oils where there was a slight increase from 132 to 138.

COMMODITY INDEX NUMBERS

Using the U. S. Department of Labor wholesale price index for main groups of commodities, 1945 experienced a very slight upward change in the price level, namely, from 104.9 for January, 1945, to 105.2 for September (latest available). The January index figure of 104.9 compares with 103.3 for January, 1944, 101.9 for January, 1943, 96 for January, 1942, and 80.8 for January, 1941. During the first nine months of 1945, this index represents a price increase of less than ½ of 1 per cent, and since January, 1941, of 30.2 per cent. The September, 1945, figure of 105.2 compares with total yearly averages of 104 for 1944, 103.2 for 1943, 98.8 for 1942, 87.3 for 1941, 78.6 for 1940, 77.1 for 1939, 78.6 for 1938, 86.3 for 1937, 80.8 for 1936, 80 for 1935, 75 for 1934, 66 for 1933, 64.9 for 1932, and 154.4 for 1920, the highest yearly average under this index since the beginning of the century. As already explained under the sections in this review dealing with "Agriculture" and "Manufacturing and Mining Industries," price changes for leading commodities during 1945 were extremely slight, and in many instances remained unchanged.

It is also interesting to note that the United Kingdom Board of Trade index shows a very small increase for 1945, namely, from 167.2 for January, 1945, to only 169.6 for September (latest available). The latter figure compares with 164 for January, 1944, with 162.1 for January, 1943, 156.4 for January, 1942, and 149.5 for January, 1941. In tabular form, the index numbers of the United States Department of Labor and of the United Kingdom Board of Trade for leading groups of commodities at the close of the year, compared with former years, are as follows:

LABOR CONDITIONS

With respect to labor conditions, using October as the basis (latest date furnished by the *Federal Reserve Bulletin*), 1945 employment shows large decreases along nearly all important lines as compared with the same month of 1944. For iron and steel products, the decrease extended from 168.6 for October, 1944, to 120.5 for October, 1945; for electrical machinery during the same period from 281 to 171.2; machinery (except electrical) from 222.9 to 167.9; transportation equipment (except automotive) from 1,370.3 to 404.2; automobiles from 170.2 to 114.7; nonferrous metals from 176.3 to 134; and lumber and timber and basic products from 113.4 to 91.8. In only two cases, as reported by the *Federal Reserve Bulletin*, was the decrease moderate, namely, in furniture and lumber products where the decrease from October, 1944, to October, 1945, extended only from 102.7 to 90.1, and stone, clay and glass, with a decrease from 110.9 to 107.1. For durable goods taken as a whole, the employment figure shows a decline from 221 to 136.6, and for non-durable goods a decline from 119.2 to 109.7.

With respect to payrolls, large changes are also shown in nearly all

* Under "Adjusted for Seasonal Variation," only totals are furnished, instead of figures for individual industries.

Source: *Federal Reserve Bulletin*, December, 1945.

of the leading industries, according to the payroll index furnished by the *Federal Reserve Bulletin.* The leading declines from October, 1944, to September, 1945, are as follows: iron and steel and products from 318 to 200.9; electrical machinery from 512.5 to 273.4; machinery (except electrical) from 424.7 to 274.6; transportation equipment (except automotive) from 2,964.8 to 818.4; automobiles from 313.1 to 150.5; nonferrous metals from 337.3 to 220.2; and lumber and timber and basic products from 219.2 to 184.8. For durable goods taken as a whole, the payroll figure shows a decline (October, 1944, to September, 1945) from 462.9 to 238.7, and for non-durable goods a decline from 210 to 193.2. According to the latest available report of the *Federal Reserve Bulletin,* the 1944 showing for leading types of industries as regards both employment and payrolls is as shown in the preceding table.

THE SECURITY AND MONEY MARKETS

By S. S. Huebner
Professor, University of Pennsylvania

GENERAL CONDITIONS

Stock market movements during 1945, with respect to both the price level and the volume of transactions, showed a remarkable change from the situation prevailing during recent years. It may be described as a distinctly active bull market.

The average monthly price level, at the end of the first ten months of the year (latest available), showed an appreciation of 22.3 per cent as contrasted with an increase of only 8.2 per cent during the same period of 1944. For the four leading groups of stocks the appreciation for the first ten months of the year was 19.7 per cent for railroad stocks, 21.1 per cent for industrials, 33.9 per cent for public utilities, and 21.1 per cent for copper. The total volume of transactions on the New York Stock Exchange reached the 377,000,000-share figure (44 per cent in excess of the 263,000,000 total for 1944), while transactions on the Curb Market (143,000,000 shares) exceeded those of 1944 by 102 per cent. Million-share days on the New York Exchange were the general rule throughout the year, and during four months of the first ten months of the year the daily average exceeded 1,500,000 shares. This activity compares with about 750,000-share days during 1944.

Using a combined average for all leading groups of stocks (Standard and Poor's Index), the 1945 market was consistently a bull market, with only a single period of minor recession during July and August. The three price trends of the year may be indicated as follows: (1) a rise from January to June of monthly averages, from 107.1 to 119.8, or 11.8 per cent, (2) a minor decline during July from 119.8 to 117.4, or 2 per cent, and (3) a rise from August to October, inclusive, from 117.4 to 131.0, or 12.4 per cent. The total rise from January to October, as already indicated, was 22.3 per cent. At the time of this writing (Dec. 8), current newspaper accounts were stressing the lengthy rally to average 15 year peaks. Impressive as the aforementioned increases are, it should be noted that many of the leading corporate shares experienced a much greater appreciation. Using ten giants for illustrative purposes—Chemical and Dye, American Smelting and Refining, American Telegraph and Telephone, American Tobacco, Bethlehem Steel, Chrysler Corporation, E. I. du Pont de Nemours, General Motors, Standard Oil of New Jersey, and United States Steel—the average high price for 1945 of 121.35 compares with the average closing price on Dec. 30, 1944, of 91.5, or an increase of 33 per cent.

Bonds, using the Standard and

Poor's Index for Corporate Bonds, maintained the unusually high price level reached by the close of 1944, the January 1945 high average being 117.6, and for October 118.1. During the corresponding period for 1944 there was an increase from 113.4 (for January) to 115.9 for October. Comparing October of 1945 with October of 1944, bonds showed a price increase of approximately 1.9 per cent.

Throughout 1945, and especially following the collapse of Germany and later of Japan, the stock market increasingly threw off the cautious hesitation and selectivity which characterized the market during 1944. As the year progressed an ever increasing number of factors was stressed as supporting the bull side of the market. Of these the following seem to command most attention:

(1) A strong undercurrent of inflation thinking. Following the close of hostilities abroad, there occurred an increasing laxness in war controls and an apparent breaking up of the stabilization program. Increasingly it became evident that there must be either a great increase in productive capacity or a ballooning of prices, and opinion seemed to incline progressively to the latter idea. Toward the end of the year inflationary imagination appeared more and more to have the security market within its grip. Outside of the rails, strength was particularly marked in those groups of stocks—steels, coppers and other metals, oils, sugars, etc.—which possess a large inflation protection in the form of owned natural resources.

(2) An enormous pressure of idle funds seeking investment. To an extraordinary degree purchases were outright and thus well protected against adverse market news. Moreover, many holders were inclined not to take unusual profits because of the existing high income tax brackets.

(3) Favorable corporate earnings and increased dividend declarations.

(4) Federal tax legislation reducing corporate taxes materially, and also individual taxes to a lesser degree.

(5) Better prospects for utility shares, as a result of lower taxes for 1946 and a likelihood of more liberal recapitalization plans for the common stockholders.

(6) The prospect, shared by many, of a high post-war boom in business to meet the needs of foreign war-torn nations as well as to fill the greatly depleted backlogs of domestically needed goods, repairs, and new construction.

(7) A feeling, shared very widely, that the termination of war would bring about a program of lower taxation, to stimulate business, and a substantial abolition of price and other economic restrictions.

Among the unfavorable market factors stressed during 1945, the following should be mentioned: (1) a continuation of heavy government deficit spending, and a resulting increased Federal indebtedness; (2) a substantial reaction from tremendous wartime activity, and a halting and uncertain "reconversion" to peace-time; (3) a drift toward inflation with its resulting increase in production costs, and an upward living cost trend with its unfavorable pressure upon the labor outlook; and (4) an enormous increase in the number of industrial strikes throughout the nation. By December the strike situation had reached ominous proportions, with the automotive industry practically paralyzed and with labor unions threatening also to tie up the steel, oil, and electrical industries of the nation.

Strange as it may seem, the stock market completely ignored the aforementioned ominous factors. Throughout the year the rise has been continuous for months without even a "technical correction" of importance. In fact, toward the end of the year, market psychology seemed to incline to an early settlement of existing labor controversies. More and more the inflation and boom psychologies seemed to hold the market in their grip, and all other factors seemed to be brushed aside.

INDUSTRIAL SHARE PRICES

The very substantial extent of the 1945 stock market rise is indicated by the monthly stock averages of the

Standard and Poor's barometer figures for various leading groups of stocks. Fifty representative industrial stocks had an average price of 131.8 for January. Thereafter each succeeding month showed an improvement until the average for June stood at 145.2, an increase of 10.1 per cent. For July there was a minor decline to 141.7, or 2.5 per cent. Following July, however, the monthly average increased to 143.3 for August, 153.7 for September, and to 159.7 for October (latest available). In other words, between July and October the market in this group experienced an appreciation of 12.7 per cent. The October average of 159.7, when compared with the January average of 131.8, shows an increase in the average monthly price level of 21.1 per cent. The year's October average of 159.7 compares with 127.1 for October, 1944; 117.3 for October, 1943; and with reference to approximately the same period (November), 94.1 for 1942; 93.8 for 1941; 106.9 for 1940; 123 for 1939; 129.1 for 1938; 107.8 for 1937; 168 for January, 1937, and 53.5 for the yearly average of 1932, the bottom year of the 1930-36 depression. The 1945 rise in this group of 21.1 per cent for the first ten months compares with a rise for the same period of 1944 of slightly over 8.2 per cent. It is also interesting to note that the October, 1945, average of 159.7 is nearly three times the 1932 yearly average of 53.5.

RAILROAD SHARES

With respect to 20 representative railroad stocks, the monthly price average of the Standard and Poor's barometer figures also showed an almost continuous bull market throughout the year. For January, 1945, the monthly average stood at 49.3. Thereafter the monthly average rose to 50.4 for February, 50.5 for March, 52.5 for April, 54.7 for May, and 58.6 for June. For the first half of the year, therefore, there was an average price appreciation of 18.8 per cent. Following June, the price declined to 56.6 for July, and 53.4 for August, or by a total of 9 per cent. Following August, however, the bull market in rails was resumed and continued with only minor recessions to the end of the year, the average monthly price level standing at 56.2 for September and 59 for October (latest monthly figure available). The October average of 59, when compared with the January average of 49.3, shows an increase of 19.7 per cent. It compares with 42.1 for October, 1944; 37.5 for October, 1943; 29.7 for October, 1942; 27.8 for November, 1941; 30.1 for November, 1940; 33.5 for November, 1939; 31.7 for November, 1938; 33.1 for November, 1937; 47 for January, 1936; and with yearly averages of 36 for 1935; 42.9 for 1934; 39 for 1933; and 26.8 for the bottom depression year of 1932. It is interesting to compare the October, 1945, average of 59 with the 1932 low June monthly average of 15.

PUBLIC UTILITIES

For the public utility group the 1945 average price movement reflected the largest gain for any of the major groups of shares. According to the Standard and Poor's barometer average for 20 representative public utility stocks, the monthly average rose from 57.7 for January to 71.2 for July, an appreciation of 23.4 per cent. During the intervening months averages stood at 61.3 for February, 61.2 for March, 63.5 for April, 66.5 for May and 69.9 for June. Following July, there was a decline to 69.8 for August (2 per cent), the only decline of note for the year. Following August, the bull market in utilities was resumed and continued with only minor recessions to the end of the year, the average for September being 72.9 and for October 77.3. The October average of 77.3, when compared with the January average of 57.7, showed an increase in the utility price level of 33.9 per cent. The October, 1945, average of 77.3 compares with 55.9 for the corresponding month of 1944; 51 for October 1943; 33.7 for October, 1942; 37.9 for November, 1941; 59.8 for November, 1940; 69.5 for November, 1939; 66.4 for November, 1938; 63.3 for November, 1937; 100.9 for January, 1937; 88.4 for January, 1936; and with yearly averages of 62.8 for 1935; 66.5 for 1934; 81.8 for 1933; and 88.7 for 1932.

COPPER SHARES

For a representative list of seven copper stocks, the average monthly price level for 1945 also showed a continuous bull market, with the exception of a single recession during July and August. From January to June the average rose from 91.2 to 97.2, or 6.6 per cent. Thereafter a decline occurred to 94.3 for July and 91.3 for August, a total of 6 per cent. Following August the rise was very substantial—to 99.6 for September and 110.6 for October. The October average of 110.6, when compared with the January average of 91.2, showed an appreciation in this group of 21.1 per cent. The year's October average of 110.6 compares with 82.8 for October, 1944, with 76.2 for September, 1943; and with October averages of 80.9 for 1942 and 82.4 for 1941.

COMBINED AVERAGES

Combining the 90 stocks used by the Standard and Poor's index for railroads, industrials, and public utilities, the average monthly 1945 price level rose from 107.1 for January to 119.8 for June (11.8 per cent appreciation), then declined to 117.4 for July (2 per cent decline), and thereafter rose to 117.7 for August, 125.8 for September, and 131 for October, an appreciation of 12.4 per cent. The October average of 131, when compared with the January average of 107.1, showed an appreciation for the first ten months of the year of 22.3 per cent. This compares with an appreciation of only 8.2 per cent for the same period of 1944. It should also be pointed out that the 1945 October average of 131 compares with 102.5 for the corresponding month of 1944.

* Copper figures use 1935–1939 as a base period. All other figures use 1926 as a base period. The above figures are an average for the month based on daily closing prices, except for Copper, which are weekly closing prices.

(Source of data—Standard & Poor's *Trade and Securities, Current Statistics.*)

MARKET VALUE OF SHARES

Using the figures of the New York Stock Exchange, the total value of 1,572,812,000 of listed shares on the New York Stock Exchange stood at $69,560,969,000 at the beginning of November, 1945. This value compares with $53,087,000,000 at the beginning of November, 1944; $45,101,000,000 at the close of November, 1943, and $37,374,000,000 at the close of November, 1942. The year's Nov. 1 value of $69,560,000,000 may also be compared with $37,882,000,000 on Dec. 1, 1941;

$41,848,000,000 at the same date in 1940; $45,500,000,000 in 1939; $46,081,000,000 in 1938; $40,716,000,000 in 1937; and with $62,618,000,000 for March of 1937, the high mark before the bear market of 1937-38 began its course.

MONTHLY STOCK AVERAGES

The average monthly "All Stock Price Index" as furnished by the New York Stock Exchange, stood at 80.2 for Nov. 1, 1945, as compared with 69.7 for November, 1944; 59.8 for November, 1943; 50.6 for November, 1942; 51.6 for November, 1941; 57 for November, 1940; 63.2 for November, 1939; and 64.1 for November, 1938. The Nov. 1, 1945, average of 80.2 compares with the following Dec. 1 averages for preceding years: 37.8 for 1937; 56.01 for 1936; 45.85 for 1935; 35.59 for 1934; 32.78 for 1933, and 25.61 for 1932.

VOLUME OF STOCK TRANSACTIONS

Stock transactions on the New York Stock Exchange during 1945 showed a very much larger volume of sales than was the case during 1944—377,563,575 shares as compared with 263,074,018 shares for 1944, and 278,741,765 shares for 1943. The current year thus indicates a departure from the comparative stock market stagnation that has prevailed since 1938. Only July and August showed total transactions as low as 19,977,000 and 21,714,000 shares. Every other month during the first ten months of the year showed a monthly total in excess of 25,000,000 shares. January, June, and October record the large totals of 38,995,000, 41,310,000, and 35,476,000 shares, respectively. With the exception of July, when the daily average of transactions (excluding Saturdays) was 951,000 shares, the daily average for every month from January to October was well in excess of the million share total. January, February, June, and October showed daily averages in excess of 1,500,000 shares. The 1945 total of 377,563,575 shares compares with 263,074,018 shares for 1944; 278,741,000 for 1943; 125,678,000 for 1942; 170,534,000 for 1941; 207,605,000 for 1940; 262,016,000 for 1939; 297,446.000 for 1938; 409,469,000 for 1937; 810,000,000 for 1930; and 1,125,000,000 for 1929, the highest figure on record.

On the New York Curb Market sales of shares during 1945 also showed a much larger volume (a doubling)

than was the case during 1944, namely, 143,337,205 shares, as compared with 71,061,783 shares for 1944, and 71,382,463 shares for 1943. The current year's total of 143,337,205 shares compares with 22,328,000 shares for 1942; 34,691,000 for 1941; 43,000,000 for 1940; 46,000,000 for 1939; 50,000,000 for 1938; 104,000,000 for 1937; 135,000,000 for 1936; 76,000,000 for 1935; 56,000,000 for 1934; 101,000,000 for 1933; 57,000,000 for 1932; 110,000,000 for 1931; 220,000,000 for 1930; and 474,000,000 for 1929, the largest on record.

THE BOND MARKET

Bond sales on the New York Stock Exchange during 1945 indicated a comparatively dull market, and the total was approximately the same as that of 1944, namely, $2,261,985,110, as compared with $2,694,704,000 for 1944; $3,254,716,000 for 1943; $2,313,000,000 for 1942; $2,114,000,000 for 1941; and $1,672,000,000 for 1940.

During 1945, bonds maintained an unusually high and steady price level throughout the year. Using Moody's Bond Prices as a basis (*Commercial and Financial Chronicle*, Nov. 29, 1945) the average for domestic corporation bonds stood at 113.89 at the end of January, 1945. By June 29 the average price had risen to 116.02. Thereafter the average price fluctuated narrowly from month to month until the price stood at 117 on Nov. 27 (the latest available). This compares with 113.12 for the corresponding date of 1944, and 110.52 for 1943. It also compares with high and low averages for 1942 of 107.62 and 106.04, with high and low for 1941 of 108.52 and 105.52, and with high and low for 1940 of 106.74 and 99.04. The Nov. 27, 1945 price is 3.88 points in excess of the price on the corresponding date in 1944. United States Government bonds stood at the high average level of 123.79 on Nov. 27, 1945, compared with high and low for the year of 123.79 and 120.55, and with high and low for 1944 of 120.4 and 119.2; with 120.7 and 116.85 for 1943; 118.41 and 115.9 for 1942; 120.05 and 115.89 for 1941; and 119.63 and 113.02 for 1940.

The extraordinarily high price of bonds brought the average bond yield to very low figures. According to Moody's Bond Yield Average, the average yield for all of the domestic corporation bonds was down to 2.80 per cent on Nov. 27, 1945. However, for choice bonds (the Aaa group) the yield was only 2.61 per cent, as compared with 2.71 per cent a year ago; 2.74 per cent in 1943; 2.82 per cent in 1942; and 2.80 per cent in 1941.

Using the Standard and Poor's barometric averages for a representative group of corporate bonds, the monthly high average stood at 117.6 for January, 1945. Thereafter the price fluctuated slightly from month to month, the monthly high average standing at 117.9 for February, 118.2 for March, 118.3 for April, 118 for May, 118.4 for June, 118.2 for July, 117.6 for August, 117.4 for September, and 118.1 for October, the latest available. The year thus shows a remarkably stable bond market at an unusually high price level. It should also be noted from the accompanying table that the monthly fluctuation between high and low was very small, February being the only month which showed a range between high and low of as much as 0.90 points.

COMPOSITE BOND PRICES FOR 1945

	High	Low
January	117.6	117.0
February	117.9	117.0
March	118.2	117.8

August	117.6	116.9
September	117.4	116.8
October	118.1	117.3
November	—	—
December	—	—

All bonds listed on the New York Stock Exchange (1,174 issues) showed a total market value of $128,741,461,000 at the beginning of November, 1945. This compares with $101,801,493,000 at the corresponding date in

1944, and with $90,969,000,000 on Dec. 1, 1943, $64,544,000,000 on the corresponding date in 1942, $54,813,000,000 in 1941, and $50,755,000,000 in 1940. The substantial increase in the 1945-1943 figures is largely attributable to the issue of large amounts of United States Government securities during those years. On Nov. 1, 1945, the average price of the aforementioned listed bonds stood at 103.16, which compares with 100.71 at the corresponding date of 1944, and with 99.02 in 1943, 96.11 in 1942, 94.8 in 1941, 93.58 in 1940, 91.24 in 1939, 90.34 in 1938, 92.36 in 1937, 100.55 in 1936, and 81.36 in the bottom depression year of 1932.

THE MONEY MARKET

With respect to both time and call loan rates, the 1945 tendencies represented an exact continuance of the situation prevailing during 1944 and the preceding ten years. As was the case during previous years, in fact as far back as 1933, New York time and call loan rates were quoted at only about 1 per cent or under. Beginning with a January average of 0.75 per cent for four to six months prime commercial paper, and 1 per cent for call loans in New York, the average monthly rate remained fixed at these low figures month after month throughout the year. These average rates are approximately the same as those prevailing during 1944, when the monthly rate on prime commercial paper averaged 0.69 per cent for January to April, inclusive, and 0.75 per cent for the balance of the year. For call loans in New York, the monthly average remained uniformly at 1 per cent for every month of the year.

According to the New York Stock Exchange figures (Nov. 1, 1945), the borrowings of New York Stock Exchange members on collateral security continued to show a small volume. The total of $911,000,000 for Oct. 31, 1945, compares with $878,000,000 for November, 1944; $718,000,000 for the corresponding month of 1943; $342,000,000 for 1942; $436,000,000 for 1941; $362,000,000 for 1940; $336,000,000 for the bottom depression year of 1932; $2,162,000,000 for 1930; and $4,017,000,000 for 1929.

BANKING AFFAIRS

By Robert W. Bachelor
American Bankers Association

GENERAL

Total deposits (exclusive of interbank deposits) in all banks in the United States, and currency outside the banks, rose to $175,000,000,000 at the end of 1945, an increase of $25,000,000,000 during the year, compared with an increase of $28,000,000,000 in 1944 and $23,000,000,000 in 1943. About half of this increase of $25,000,000,000 was in demand deposits of individuals and corporations and currency outside the banks. The other half represented expanded time deposits and deposits of the United States Government. Currency in circulation increased $3,200,000,000 in 1945, compared with approximately $5,000,000,000 in each of the years 1944 and 1943.

Interest rates on government securities and private obligations, and stock yields, declined throughout the year, as a large supply of excess reserves for the banking system was maintained by the Federal Reserve authorities.

Assets of all banks in the United States on June 30, 1945, totaling $163,000,000,000, were almost equally divided between national banks and state chartered banks. Total assets of national banks were $81,800,000,000, and of state-chartered banks, $81,200,000,000. Of this latter group, commercial banks had assets of $65,000,000,000 and mutual savings banks, $16,000,000,000.

RESERVES

Expanding deposits of the banking system required larger reserves. This increase in reserves was made possible chiefly by open market purchases of United States Government securities by the Federal Reserve banks. Excess reserves, which fluctuated around $1,000,000,000, facilitated the making of day-to-day adjustments between banks as deposits were shifted from one bank to another and from one section of the country to another. One billion dollars of excess reserves also was sufficient to maintain an easy money situation in the financial community, as there was always pressure of uninvested funds against the existing interest rate structure. At the year-end, excess reserves totaled $1,500,000,000.

At the close of the year the Federal Reserve banks held $24,000,000,000 of United States Government securities, an increase of $5,400,000,000 during 1945. These purchases enabled member banks to buy $3,200,000,000 of currency to meet public demands and to replenish their own vault supplies; to meet the cancellation of more than $500,000,000 of deposits as gold was withdrawn for earmarking, export, or industrial uses; and to add nearly $2,000,000,000 to legally required reserves, which aggregated $14,400,000,000.

Federal Reserve banks are able to purchase government securities by creating obligations against themselves. Checks issued in payment for securities are drawn upon the purchasing Federal Reserve bank, and can only be deposited in a Federal Reserve bank to increase member or non-member deposits, or taken out in the form of notes. Either form of increased Federal Reserve bank liability requires the same percentage of gold certificate reserve.

On June 12, 1945, legislation was approved which changed the reserve required of Federal Reserve banks from 40 per cent in gold certificates against notes, and 35 per cent in gold certificates or lawful money against deposits, to a minimum of 25 per cent of gold certificates against deposit or note liability. At the time of enactment and subsequently during 1945, the heavy purchases of securities by the Federal Reserve banks, which were required to support the increase in currency in circulation, substantial export of gold, and need for increased commercial bank reserves, had so reduced the ratio of gold certificate reserves to deposit and note liabilities as to leave too small a margin between actual reserves and legal limits. The reserve ratio of Dec. 26, 1945, was 41.9 per cent.

The reduction of reserve requirements to 25 per cent of note and deposit liabilities makes it possible for the Federal Reserve banks to increase the supply of member bank reserves very substantially, at the same time supporting additions to money in circulation, and reductions in the gold stock, if these should be required. It allows an ample margin to enable the banking system to meet all probable needs of the Government for financing. Reserve requirements can always be lowered again if one or more reductions are not sufficient.

The same bill that changed the required reserves of the Federal Reserve banks terminated the authority to issue Federal Reserve bank notes and the authority to issue United States notes under the Thomas amendment of May, 1933.

LOANS AND INVESTMENTS

Total loans of banks were expanded substantially during the war years and in the last six months of 1945. Commercial, industrial, and agricultural loans, and loans for purchasing or carrying United States Government securities, increased in almost equal amounts and accounted for the greater part of the expansion.

Investments of banks in government securities accounted for more than half of the increase in deposits during the war. It is estimated that at the end of September, 1945, commercial banks held $83,500,000,000 of United States Government securities, and mutual savings banks, $10,000,000,000. At that same date, Federal Reserve banks held $23,300,000,000 of these securities.

The expansion of loans during the final months of 1945 was substantial in all lines, as businesses were converted to peacetime operations. In December, the Victory Loan was accompanied by a large expansion of loans for the purpose of purchasing or carrying United States Government securities. Loans for the purpose of purchasing or carrying other securities were small in amount, since war financing took precedence over private issues in early 1945, and most privately-sponsored issues were for refunding outstanding securities rather than to provide new money for industry. Loans for purchasing or carrying other securities were restricted further by action of the Board of Governors of the Federal Reserve System in raising margin requirements for extensions of credit by brokers and dealers on listed securities, under Regulation "T"; and for loans by banks on stocks, under Regulation "V." Effective Feb. 5, 1945, margin requirements for both these types of lenders were raised from 40 per cent to 50 per cent. Effective July 5, 1945, these requirements were increased to 75 per cent margin. Margin for short sales was also increased from 50 per cent to 75 per cent. The margin requirement represents the difference between the market value of the security (100 per cent) and the maximum loan value.

Bankers have cooperated with the Veterans Administration and veterans organizations in working out ways and means of expediting loans to war veterans. Many banks have preferred to make loans to individual veterans without the guarantee of the Government, with its attendant delays and involved procedure.

The number of credit groups organized to extend credit to individuals and businesses whose demands could not be met by their local banks, was increased to 48, with aggregate commitments of $664,827,675. All sections of the United States are covered by one or more groups. This form of organization to supplement local banking resources has been able to meet business requirements for credit.

Banks have indicated their intention of engaging in the active financing of consumers, as greater quantities of consumers' durables reach the market.

Bank rates on customers' loans, for the third quarter of 1945, were reported by the Board of Governors of the Federal Reserve System as 2.45 per cent average for 19 cities, and 2.05 per cent for New York City. All member banks of the Federal Reserve System averaged to earn 3 per cent on loans during the first half of 1945, compared with 3.3 per cent for the corresponding period of 1944.

DEPOSITS

Deposits in all banks in the United States increased $25,000,000,000 during 1945, to $175,000,000,000 at the close of that year. Time and savings deposits increased $10,000,000,000; demand deposits, exclusive of interbank and government deposits, increased about $11,000,000,000; and there were small increases in deposits of the United States Government and of banks.

Demand deposits of individuals, partnerships, and corporations, on

July 31, 1945, amounted to $42,400,000,000. Ownership was estimated as follows:

	(Billions)
Total domestic business	$42.4
Non-financial business—total	37.1
Manufacturing and mining	18.4
Public utilities	4.0
Trade	10.9
Other non-financial	3.8
Financial business—total	5.3
Insurance companies	1.8
Other financial	3.5
Personal	23.0
Farmers	5.2
Other	17.8
Trust funds	1.5
Non-profit associations	2.0
Foreigners—businesses and individuals	.7
Total	$69.6

It is estimated that deposits of domestic business are owned by corporations to the amount of $31,900,000,000, and that unincorporated businesses own $10,600,000,000.

The geographical distribution of the increase in bank deposits generated by government borrowing from the banks followed a pattern quite different from that of pre-war deposit localization.

The greatest rates of deposit expansion took place in centers that had newly established war plants. Generally, the rate of increase was greatest in the south and west, particularly the Pacific Coast area. The percentage increase in deposits in the east and northeast was substantially less than the national average, while the rate of increase in western and southern districts was substantially greater than for the United States as a whole.

Farming sections generally gained deposits, since there was an assured market for agricultural products, while farm equipment was difficult to obtain. Deposits tended to be built up in country banks. The greatest increase in dollar amount of deposits, however, took place in a few metropolitan areas which had large war production.

Notwithstanding the initial abnormal concentration of deposits in certain areas, these funds usually are rather quickly diffused throughout the United States as materials are purchased, loans made and borrowings repaid, and services compensated. At times when the money supply of this country is being expanded, nearly every section shares in the increase.

Capital accounts of all banks in the United States, on June 30, 1945, were $10,152,000,000, or 6.7 per cent of the $151,900,000,000 of deposits of these banks. However, if allowance is made for the $94,200,000,000 of United States Government securities, and $30,900,000,000 of coin, currency, and balances with other banks, including Federal Reserve banks, the ratio of capital to deposits, less riskless assets, amounts to more than 60 per cent. This ratio represents one of the highest coverages in banking history. Most of the expansion of bank credit during the war years was based on United States Government securities.

Several large banks floated new issues of stock during 1945, but bank stocks have not been regarded as attractive investments, since dividends paid for the years 1942-1945 have averaged only 3.2 per cent of capital employed in the commercial banking business. Rates of earnings have been substantially higher than dividends paid, but requirements for increasing capital structures would seem to eliminate all possibility of a higher dividend rate for several years.

ASSETS AND LIABILITIES OF ALL BANKS IN THE UNITED STATES

Assets and liabilities of all active banks in the United States and possessions, by classes of banks, at the close of business June 30, 1945, are shown in the table on the next page.

the attention of the public and the Congress during 1945.

The American Bankers Association approved the objectives of the Bretton Woods program in general and the proposal for the International Bank for Reconstruction and Development in particular, but pointed out a number of serious dangers or inadequacies in the Fund as projected and proposed definite methods by which the plan could be revised so as to remove or lessen the dangers without sacrificing the major objectives or imperiling its acceptance by other countries.

Officers of the Association appeared before the Banking and Currency Committee of the House of Representatives and made the following recommendations:

1. That the capital funds of the Export-Import Bank be increased to $2,000,000,000, first, to provide means for meeting promptly deserving credit needs prior to the setting up of an international bank, and second, to enable the United States to make loans in which this country has special interest and which can be made more effectively through a national institution than through an international body.

2. That the Johnson Act and any analogous provisions in the Neutrality Act now standing in the way of private loans to certain foreign countries be repealed.

3. That the Bretton Woods plan for an International Bank for Reconstruction and Development be adopted, but with the following suggested changes: (a) that the two paragraphs in the Bank agreement which make membership in the Bank dependent on membership in the Fund be deleted; (b) that an article be added placing on the governors and directors of the Bank responsibility for arranging and negotiating agreements between the member countries with respect to the stabilization of currencies, removal of exchange controls as rapidly as practicable, and general rules of procedure for carrying out monetary policies; (c) that the Bank be authorized to collect information with respect to monetary and economic matters as outlined in the Monetary Fund proposal; (d) that the lending powers of the Bank be broadened sufficiently to allow it to make loans, under the same safeguards as the other loans of the Bank, for the purpose of aiding countries in stabilizing their currencies; and (e) that a Council be set up in the Government of the United States to supervise foreign lending policies.

The bill was passed by the Senate on July 19, 1945, and was approved by the President. Foreign governments for the most part did not ratify the agreements until December. France devalued her currency before participation, and the United Kingdom completed negotiations for a loan of $3,750,000,000, in addition to an obligation for $650,000,000 for surplus property and installations located in the United Kingdom. Those who opposed the precise form of the Bretton Woods agreements as originally published, had long contended that the relationships of the "key currencies," especially means for stabilizing the dollar-pound sterling balance of payments, should be settled before the international monetary fund and international bank could function in the manner intended by the agreements. This major problem in world finance was well advanced toward settlement at the close of the year when the Bretton Woods agreements were signed by the principal commercial powers, exclusive of Russia.

AMERICAN BANKERS ASSOCIATION

The American Bankers Association, the national organization of banking, includes in its membership 15,500 of the 16,000 state commercial, national, savings banks, and trust companies and other eligible institutions.

It was not feasible to hold a convention or meeting of the Executive Council during the year. At the meetings of the Administrative Committee, the following resolutions and policies were approved:

1. Resolutions by the Consumer

Credit Committee were approved to the effect that the restrictions imposed by Regulation "W" should be gradually relaxed in relation to the production of consumers' durable goods.

2. The principle of permitting national banks to make real estate loans to veterans of higher ratio to appraised value of property and for longer terms than heretofore, was approved. A broadening of the law with respect to other borrowers was also approved.

3. Extension of reciprocal trade agreements was approved in principle.

4. The action of the officers and the Advisory Committee on Special Activities in presenting to Congress and the public the Association's views on the Bretton Woods proposals, was ratified and approved.

5. The declaration by the Association on Sept. 15, 1943, that direct commercial loans by the government or governmental guaranties of commercial loans are not only unnecessary for the financing of post-war commercial enterprise, but are actually contrary to sound financial policy and the best interests of the American economy, was reaffirmed.

The Committee on Federal Legislation was directed to prepare such amendment or amendments to 12 U.S.C. Section 24 as may be necessary to permit national banks to purchase domestic "open" accounts receivable and submit the same to the Administrative Committee or Interim Committee for approval.

It was determined that the Association should endeavor to have the licensing of banks by the Treasury Department eliminated.

Officers for 1945-1946 were elected as shown below: President—Frank C. Rathje, president, Chicago City Bank and Trust, Chicago 21, Ill.; Vice President—C. W. Bailey, president, First National Bank, Clarksville, Tenn.; Treasurer—S. Albert Phillips, vice president, First National Bank, Louisville 1, Ky.; and Executive Manager—Harold Stonier, New York, N. Y.

TRUST BUSINESS

By Gilbert T. Stephenson

The Graduate School of Banking, American Bankers Association

TRUST DIVISION, AMERICAN BANKERS ASSOCIATION

The 1945-1946 organization of the Trust Division of the American Bankers Association is as follows: President, James W. Allison, vice president, Equitable Trust Company, Wilmington, Del.; Vice President, Evans Woollen Jr., president, Fletcher Trust Company, Indianapolis, Ind.; Chairman of the Executive Committee, R. M. Alton, vice president in charge of trust department, United States National Bank, Portland, Ore.; Secretary, Merle E. Selecman, deputy manager, American Bankers Association; Members of the Executive Committee: Louis S. Headley, president, First Trust Company of St. Paul, St. Paul, Minn.; Henry A. Theis, vice president, Guaranty Trust Company of New York; Chester R. Davis, vice president and trust officer, Chicago Title and Trust Company, Chicago, Ill.; William Hardin Goodman, vice president and trust officer, Florida National Bank, Jacksonville, Fla.; T. Stanley Holland, vice president and trust officer, American Security and Trust Company, Washington, D. C.; Howard C. Lawrence, director, The Michigan Trust Company, Grand Rapids, Mich.; George C. Barclay, vice president, City Bank Farmers Trust Company, New York; H. M. Bardt, vice president and trust officer, Bank of America N.T. & S.A., Los Angeles, Calif.; J. M. Hutchinson, vice president and trust officer, Davenport Bank and Trust Company, Davenport, Ia.; Lee P. Miller, vice president, Citizens Fidelity Bank and Trust Company, Louisville, Ky.; John A. Reid, vice president, The First National Bank of Cincinnati, Cincinnati, O.; John H. Evans, vice president and trust officer, McDowell National Bank, Sharon, Penn.; N. Baxter Maddox, vice president and trust officer, The First National Bank, Atlanta, Ga.; John W. Remington, vice president and trust officer, Lincoln Rochester Trust Company, Rochester, N. Y.; Leo A. Steinhardt, president, International Trust Company, Denver, Col.; and B. Magruder Wingfield, vice president and trust officer, The National Bank of Commerce, Houston, Tex.

On Oct. 16, 1945, Frederick A. Carroll, immediate past-president of the Trust Division, while serving on leave from the National Shawmut Bank of Boston as Red Cross Commissioner for Great Britain and Western Europe, was killed in an automobile accident in France.

TRUST CONFERENCES

Because of wartime restrictions upon travel, the regular annual trust conferences, that is, the Mid-Winter, the Mid-Continent, and the Pacific Coast and Rocky Mountain States Conferences, were not held. However, during the first half of 1945 a series of 12 small conferences—one in each of the Federal Reserve Banks—were conducted with the Federal and state bank supervisory authorities. During the latter part of the year, 17 local conferences were conducted in the states of Virginia, Connecticut, Alabama, Mississippi, and New York, especially designed for smaller trust departments. These conferences for smaller trust departments are to be continued throughout 1946.

TRUST LEGISLATION

During 1945 regular sessions of the legislature were held in 44 states. A summary of the trust legislation adopted follows. Common trust fund enabling acts were adopted in Maryland, New Jersey, and West Virginia, making a total of 26 states now authorizing the establishment of common trust funds. Indiana adopted an intermediate court accounting act, making a total of 15 states having such legislation. Delaware, Maryland, Ohio, Vermont, and West Virginia adopted statutes authorizing the nominee registration and transfer of securities held in trust accounts, making a total of 21 states authorizing nominee registration. Arkansas and Georgia adopted probate codes, making a total of 10 states with such codes. Illinois, Maine, and Texas adopted by statute the Prudent Man Rule for trust investment, making a total of 14 states now operating under the Prudent Man Rule.

Arkansas, Montana, Nebraska, Oklahoma, and South Dakota adopted the reciprocal exemption from multiple inheritance taxation act, making a total of 26 providing for reciprocal exemption and 216 states, including the District of Columbia, granting total exemption. Alabama, California, Colorado, Georgia, Indiana, Michigan, and South Dakota adopted the release of powers of appointment act, making a total of 20 states with such legislation. Minnesota adopted the Uniform Fiduciaries Act, making a total of 20 states which have adopted the act. Pennsylvania, the 14th state, adopted the Uniform Principal and Income Act.

California and Delaware, the 25th and 26th states respectively, adopted the Uniform Simultaneous Death Act. Delaware, District of Columbia, Nevada, Oklahoma, South Carolina, and Wyoming adopted the Uniform Stock Transfer Act, making a total of 45 states which have adopted this act. Arizona, Colorado, Iowa, New Mexico, and Oklahoma adopted the Uniform Veterans' Guardianship Act, making a total of 14 states. Maryland adopted, and so far is the only state which has adopted, the uniform act on interstate compromise of death taxes when domicile is in dispute. From the foregoing it is to be seen that the year 1945 was a notable one for uniform trust legislation.

SMALL ESTATES AND SMALL TRUSTS

The year was characterized also by emphasis by trust institutions upon the acceptability of small estates and trusts. As to small estates, some trust institutions, through advertisements, are offering their services as executor or administrator for estates as small as $1,000; others, as small as $5,000.

Samplings of the probate records in different parts of the country reveal a surprisingly large proportion of very small estates. For example, in one group of 7,340 estates recently settled in six counties in five states, taken in order from the probate records, 56.3 per cent in number were $5,000 or under; of 25,514 estates in 13 counties in seven states, 83.4 per cent were $10,000 or under; and of 28,087 estates in 13 counties in eight states, 93.1 per cent were $25,000 or under. If this is a fair cross section of estates being settled, it shows that over 50 per cent are $5,000 or under; over 80 per cent, $10,000 or under; and over 90 per cent, $25,000 or under.

Not only are more trust institutions publicly expressing willingness to accept small estates for settlement but also they are paying special attention to operating economies that will enable them to settle small estates economically to the beneficiaries and profitably to themselves and to special legislation that will expedite the putting of small estates through probate.

The attitude of trust institutions toward small trusts is shown by the growth of the common trust fund movement. The main, if not the sole, purpose of common trust funds, providing as they do for the collective investment of small funds, is to enable trust institutions to administer small trusts economically and profitably. As already pointed out, 26 states now by statute or decision authorize the establishment of common trust funds by banks and trust companies. At the present time there are known to be 46 funds (not all of them common trust funds in the technical sense) for the collective investment of trust funds in 16 states and in 39 banks and trust companies. At least 12 of these funds in seven states have been established since Sept. 1, 1944. It is known that several other common trust funds are in process of establishment, that is to say, they are being tried out on paper before actual investments are made.

The need for the administration of small trusts by trust institutions is based on the fact that such a surprisingly large proportion of the trusts under administration at the present time are small ones. A 1942 survey of 153,646 private trusts under administration in 1,047 trust institutions showed that 48.81 per cent of these trusts each produced an annual income of less than $750. Capitalized at 3 per cent, this means that nearly one-half of these trusts were less than $25,000 each. A 1943 survey made by the Superintendent of Banks of New York State showed that, in 15 of the largest institutions in New York City, 38.3 per cent of the trusts under will and 28.6 per cent of the living trusts were $25,000 or under, and in 17 of the larger trust institutions in New York State outside New York City 64.5 per cent of the trusts under will and 54.9 per cent of the living trusts each was $25,000 or under.

During 1945 the Board of Governors of the Federal Reserve System made one material change in its regulation of common trust funds in that it raised the limit of the amount of funds of any one trust which may be invested through common trust funds from $25,000 to $50,000. This will permit the wider use of common trust funds for larger trusts.

SERVICEMEN RETURNING TO TRUST WORK

The last quarter of the year was characterized by the return of servicemen to trust work and by the efforts of banks and trust companies to fit them back into their former positions or provide positions more suited to their tastes and abilities in the light of their development and maturity acquired during their years of war service.

This led to a good deal of inquiry

as to a young person's future in the trust business. A study of the monetary return a young person reasonably might expect, if he made good in the trust business, revealed that, on the basis of returns from 516 trustmen representing every state and 153 cities, the average salary of trustmen in the United States is $8,454, as compared with $8,688, the average professional earnings of a selected group of 5,000 physicians. It showed also that the salaries of trustmen compare favorably with the professional earnings of lawyers and with the salaries of chemists and chemical engineers.

While the demand for trustmen is, necessarily, limited—there being only about 3,000 trust departments (including branches) in the United States and only about 7,000 trust officers—the demand will increase as the base of trust business is broadened through the acceptance of smaller estates and smaller trusts. Even now there are attractive openings for young persons who are prepared and determined to make trust business their life work.

FOREIGN EXCHANGE

By MARCUS NADLER

PROFESSOR, NEW YORK UNIVERSITY

INTERNATIONAL MONETARY FUND

The year 1945 was remarkable in many respects. It marked the end of the greatest war in history and the beginning of international cooperation in matters of international banking, foreign exchange as well as foreign trade. The most important development in the field of international finance during the year was the adoption of the Bretton Woods Agreement. Under it two institutions are to be established, namely, the International Monetary Fund and the International Bank for Reconstruction and Development.

From the aspect of foreign exchange the Fund is of far greater importance. The principal provisions relating to foreign exchange may briefly be summarized as follows. A country may depreciate its currency by 10 per cent without the consent of the Board of the Monetary Fund. Any depreciation beyond 10 per cent will need the consent of the Monetary Fund which will be given only if the applicant can prove that it is absolutely essential to prevent a disequilibrium. Through the Fund, central banks or other agencies of the Government will be in a position to obtain short-term foreign credits and tide themselves over periods when their international balance of payments is maladjusted. If ratified, it will establish for the first time in history an organization which will supervise the international financial transactions of central banks and prevent the adoption of measures which might prove helpful to an individual country but harmful to other nations. Under the agreement, all members also agree to remove their foreign exchange restrictions on current transactions within three to five years. Such restrictions on capital transactions will remain in force for some time to come.

Hence if the Bretton Woods Agreement is ratified there are reasons to believe that machinery will be set up to avoid currency wars, undue fluctuations of currencies, and facilities established to enable countries to meet temporary deficits in their balance of payments. The International Bank for Reconstruction and Development is intended to provide countries with capital to restore their economies or to develop their natural resources.

THE ANGLO-AMERICAN AGREEMENT

From the beginning it was apparent that the British would not be able under existing conditions to ratify the

Bretton Woods Agreement and to undertake the obligations imposed on members unless a substantial credit were received from the United States. Toward the end of the year an agreement was reached between the two countries which provides, among other things, that all lend-lease transactions carried out prior to V-J Day were cancelled. The American Government extended a credit of $650,000,000 to the British Government to enable the latter to pay for all lend-lease shipments to Great Britain after V-J Day and for the purchase of American surplus products in Britain as well as for American interests in installations. The $650,000,000 will, therefore, liquidate all obligations incurred by Great Britain in the United States during the war.

Of greater significance was a line of credit granted by the United States to Great Britain. This credit is to take effect as soon as the agreement has been ratified, and it is to be used up to the end of 1951. The credit is to be repaid over a period of 50 years beginning with 1951 at a 2 per cent interest rate, payable also beginning with the end of 1951. The purposes of the credit are to enable Great Britain (a) to buy goods in the United States, (b) to buy goods in countries other than the United States, (c) to accumulate gold and dollar balances, and (d) to be able to return to multilateral trade. The British Government agreed that, within one year after the agreement has gone into effect, unless postponed by mutual agreement, all sterling exchange as well as dollars accruing to members of the sterling area from current transactions will be freely convertible into any currency desired by the owner. The British also agreed to remove, within one year after the effective date of the agreement, foreign exchange restrictions on exports from the United States.

Hence, if the agreement is ratified, the wide sterling area will be opened to American trade and ought to have a favorable effect on exports from this country to that area. Furthermore, the credit granted to Great Britain assures that the pound will not be depreciated and that the present rate may be maintained for some time. These were the principal developments in the field of international finance during 1945.

CURRENCY REFORMS IN EUROPE

After the liberation of France, Holland, and Belgium, the governments of the respective countries took measures to reduce the volume of currency in circulation and deposits which had greatly increased during the period of occupation. Old currency was converted into new, and a substantial portion of the deposits was also blocked. The purposes of these measures were as follows: (1) to reduce the volume of the medium of exchange and thus to fight the forces of inflation which were very pronounced; (2) to catch all those who have profited from collaboration with the enemy as well as those who have profited from black market operations and those who did not pay taxes during the period of occupation.

In all three countries the rate of exchange of the individual currencies in turn was lowered. In Holland, for example, the monetary agreement of Sept. 7, 1945 with Great Britain fixed the rate of exchange at 10.691 florins to the pound sterling, or about 37.4 United States cents, as compared with 53.3 cents in 1939. In Belgium the rate of exchange was fixed at 176.625 francs to the pound, or 2.26 United States cents, as compared with 3.37 cents in 1939. The exchange rate of the French franc is still greatly overvalued, and a depreciation is to be expected in the not distant future. At the present rate the French economy is not able to compete in foreign markets. Whether the currencies of other continental European countries will be further depreciated or devalued is not yet clear.

FINANCIAL AGREEMENTS BETWEEN GREAT BRITAIN AND BELGIUM

Other events of considerable importance in the foreign exchange market were the various agreements made between the British Government and a number of European countries such as Belgium, Holland, Sweden, and others.

The agreement with Belgium, which was the basis for the other agreements, provides that the official rate of the pound is fixed at 176.625 Belgian francs which rate may be changed only after mutual consultation. It also provides that the bank of England shall sell sterling to the National Bank of Belgium in order to enable residents of the Belgian monetary area to make payments (under the exchange regulations in force in that area) to residents of the sterling area. The Belgian francs received by the National Bank of Belgium are credited on its books at the official rate of exchange to account No. 1 of the Bank of England. The balance standing to the credit of that account is not to exceed Belgian francs 883,125,000. If the balance exceeds this amount, the Belgian National Bank is to earmark gold for the difference to the account of the Bank of England.

Similarly, the National Bank of Belgium is to sell Belgian francs to the Bank of England in order to enable residents of the sterling area to make payments (under the exchange regulations in force in that area) to residents of the Belgian monetary area. The pounds received by the Bank of England shall be credited on its books to account No. 1 of the Bank of Belgium up to an amount of £5,000,000 plus such additional sum as the contracting governments shall have agreed to recognize as equivalent to the net amount of sterling owned by residents of the Belgian monetary area at the date on which this agreement enters into force. If the balance exceeds this amount, the Bank of England is to earmark gold for account of the Belgian National Bank. The gold earmarked by one central bank for account of the other is at the free disposal of its owner and may be exported.

Residents of the Belgian monetary area may use their sterling balances for making (a) transfers to other residents of the Belgian monetary area; (b) payments to residents of the sterling area; or (c) transfers to residents of countries outside the Belgian monetary area and the sterling area to the extent to which these may be authorized by the Government of the United Kingdom under the arrangements contemplated in Article 8 (iii). Similarly, residents of the sterling area may use their Belgian franc balances.

Article 8 (iii), referred to above, provides that, as opportunity offers, the Contracting Governments shall seek with the consent of the other interested parties: (a) To make Belgian francs at the disposal of residents of the sterling area and sterling at the disposal of residents of the Belgian monetary area available for payments of a current nature to residents of countries outside the sterling area and the Belgian monetary area; and (b) to enable residents of countries outside the sterling area and the Belgian monetary area to use sterling at their disposal to make payments of a current nature to residents of the Belgian monetary area, and to use Belgian francs at their disposal to make payments of a current nature to residents of the sterling area.

To the extent to which the National Bank of Belgium requires sterling area currencies, other than sterling, for the purpose of providing for payments in the countries where such currencies are legal tender, the National Bank of Belgium shall purchase them through the Bank of England against payment in sterling.

To the extent to which the Bank of England requires Congolese francs for the purpose of providing for payments in the Belgian Congo and the Mandated Territory of Ruanda Urundi, the Bank of England shall purchase them through the National Bank of Belgium against payment in Belgian francs.

The two governments agree to prevent capital transfers which serve no useful economic and commercial purpose.

Sterling held by the National Bank of Belgium and Belgian francs held by the Bank of England can be invested only as agreed between the two institutions.

The agreement is for three years, but can be rescinded at any time after a month's notice. It may be revised if the two governments should adhere to a general international monetary agreement.

The Belgian monetary area is defined as embracing Belgium, Luxembourg, Belgian Congo, and Mandated Territory of Ruanda Urundi.

BRITISH-SWEDISH AGREEMENT

The Monetary Agreement entered into by Great Britain and Sweden is technically similar to that concluded with Belgium. It also applies to the entire sterling area "which shall have the meaning from time to time assigned to it by the exchange control regulations in force in the United Kingdom". The principal differences are: (1) No upper limit has been set to the amounts of sterling and Swedish kronor balances which the Riksbank and the Bank of England, respectively, may hold; (2) the established rate of £1 = 16.90 Swedish kronor may not be changed by either government, except after giving the other as much notice as may be practicable; (3) the agreement is for a period of five years from Jan. 1, 1945, on which date it is considered to have become effective, and may be terminated by either government upon three months' notice.

ANGLO-FRENCH AGREEMENT

The Anglo-French financial agreement applies to the sterling area and franc area. The latter comprises Metropolitan France, including Corsica and Algeria, French West Africa, French Equatorial Africa, Madagascar and its dependencies, Reunion, French Somali Coast, French Guiana, Guadeloupe, Martinique, St. Pierre and Miquelon, French Establishments in India, Indo-China, New Caledonia, French Establishments in Oceania, the Condominium of the New Hebrides, the Protectorates of Morocco and Tunisia, the French Mandated Territories of Cameroon and Togo, Syria, and Lebanon. The agreement contains most of the provisions embodied in the monetary agreements with Belgium and Sweden and is intended to facilitate the resumption of more normal commercial relations between the sterling area and franc area. The official rate of £1 = 200 French francs may be altered only after mutual consultation. The main purpose of the agreement, however, is to settle the numerous financial claims that have arisen between the two governments since the outbreak of the war.

LATIN AMERICAN EXCHANGE MARKETS

In the Western Hemisphere the foreign exchange markets were very quiet. Throughout the year most of the Latin American countries had favorable balances of payments and they were thus able to accumulate substantial amounts of gold and foreign exchange. The following table taken from the December 1945 issue of the *Monthly Review of Credit and Business Conditions,* published by the Federal Reserve Bank of New York, shows the increase in the monetary stock of gold of some of the Latin American countries:

The currencies of these countries remained stable throughout the year, and their governments are in a position to maintain the stability of their currencies for an indefinite period of time irrespective of their balance of payments.

CURRENCY CONDITIONS IN CONTINENTAL EUROPE

On the Continent of Europe and particularly in Germany, Hungary, Austria, and Poland, the currencies deteriorated materially during 1945. Inflation became widespread, and in many countries the currencies lost their purchasing power, and currency is used only for purchases of rationed commodities. Most other transactions are carried out through barter. In fact, the situation in Europe has reached the point where one may speak of a cigarette standard. The cigarette has replaced money as the principal internal medium of exchange and has also become an important store and standard of value.

mentioned above are worse today than they were at the end of the First World War. At that time the problem was primarily a question of balancing the budget and of obtaining credits abroad after which the currency could be stabilized and put on a sound basis. In Germany for instance there was no central government in 1945 after the surrender. The volume of currency in circulation is being rapidly increased by the armies of occupation. The fiscal system has collapsed entirely, and the principal revenue is the printing press. Furthermore, destruction wrought during this war was much heavier than ever before and hence the reconstruction of the economies as well as of agriculture will be much more difficult than ever before.

How the currencies will be stabilized is as yet impossible to predict. Before the stabilization of the currency can be approached, it will be necessary first to establish efficient governments with authority to levy taxes and to collect them; second, to reactivate industry and to make civilian goods available for consumption; third, to increase the production of agriculture and of minerals, particularly coal.

Even after these measures have been achieved it will be necessary to obtain a substantial credit from abroad in order to bolster up the confidence of the people in their currency. In all likelihood currency conditions on the Continent of Europe will further deteriorate in the first half of 1946, and some of these currencies may lose their purchasing power entirely and ultimately be replaced by a new type of currency.

SUMMARY

The most encouraging aspects in the field of international banking and exchange are the various agreements made among nations, outstanding of which are the Bretton Woods Agreement, the Anglo-American Agreement as well as the monetary arrangements concluded between Great Britain and various countries. These measures were intended to prevent currency wars and to restore sound currency conditions throughout many parts of the world. While the exchange situation has improved materially in some of the western European countries, that on the Continent and particularly in former enemy countries has deteriorated. Currency inflation has proceeded to such an extent that under present conditions no solution can be found except through the complete wiping out of the existing currency and its replacement by a new one.

FOREIGN TRADE

By Grace A. Witherow
International Trade Unit, Department of Commerce

GENERAL

The end of hostilities in Europe and in the Pacific resulted in lifting the ban of secrecy on United States foreign trade data that prevailed during the war. The Government now issues statistics currently revealing the amount and commodity character of exports and imports and also provides details of the trade carried on in war years. This review, therefore, presents more complete information on United States foreign trade than do other recent annual reviews. Tables presenting statistics of trade in war and immediate pre-war years form the basis of the discussion.

TOTAL TRADE VALUE

The foreign trade of the United States showed a decline of one-third in export shipments in 1945 from a record high of the preceding year. Military exports began to recede even before VE-Day, and a gradual liquidation of all classes of lend-lease goods proceeded throughout the year. Exports, therefore, although showing increases in cash and relief supplies, dropped to a value of $9,806,000,000 from $14,257,000,000 in 1944 (Table 1). They also fell considerably lower than those of 1943, but apart from these two years exceeded all earlier annual totals, including the high value of 1920.

The export trade of 1945, as in other recent years, consisted to a large extent of lend-lease supplies. However, these accounted for less than three-fifths of total exports in that year as compared with four-fifths in the preceding two years. Military equipment lend-leased to the Allied Nations, averaging $450,000,000 monthly in 1944 and $270,000,000 in the first five months of 1945, dropped sharply following VE-Day, and after VJ-Day became negligible. Other lend-lease goods, showing a more moderate decrease, fell in September to approximately three-tenths the May amount and remained relatively small in succeeding months through December. Total lend-lease shipments for the year aggregated $5,562,000,000, less than half the value of the preceding year, when they reached a high of $11,306,000,000. Value of lend-lease shipments and the proportion they constituted of total exports in each year after 1940 are shown in Table 5.[1]

Exports other than lend-lease showed a substantial increase in 1945 as lend-lease shipments dropped, but since cash exports constituted approximately two-fifths of total exports, their gain was overshadowed by the decline in lend-lease goods. Non-lend-lease exports, rising by 44 per cent over the 1944 total, amounted to $4,244,000,000, the highest value for any year after 1941, when shipments of military goods to the British Empire on pre-lend-lease order were still substantial. Marked gains in cash purchases accounted for three-fourths of the rise, and the remainder consisted of shipments made by UNRRA and private relief agencies, which increased from a value of $120,000,000 in 1944 to $480,000,000 in 1945.

Imports into the United States, valued at $4,136,000,000, showed an increase of 5 per cent, a smaller gain than in the preceding year. This

---

[1] Trade statistics class lend-lease shipments as exports after March 1941, when the lend-lease program began to function. Though this program officially ceased to operate at the end of the war, it was not possible immediately to stop the flow of supplies arranged for under lend-lease procurement facilities. Supplies in transit or on order and urgently needed for reconstruction are therefore shown as lend-lease exports through the final months of 1945, although the recipient nations arranged to finance them. Equipment and supplies sent to United States armed forces abroad, though of the same character as lend-lease goods, are not classed as exports in foreign-trade statistics.

TABLE 1

UNITED STATES MERCHANDISE EXPORTS AND IMPORTS [1] AND BALANCE OF TRADE

(Value in millions of dollars. Data through 1915 are for fiscal years ended June 30; other data are for calendar years. Coverage of lend-lease and cash exports during war years is explained in Table 4.)

[1] Exports, including re-exports, and general imports.

[2] Physical movements of gold are adjusted to include changes in gold earmarked in the United States for foreign account and in gold earmarked abroad for United States account. Gold is valued at $20.67 per fine ounce through January 1934 and at $35 thereafter.

[3] Period July 1, 1915 to December 31, 1920.

[4] Balance excluding lend-lease shipments.

Source: U. S. Department of Commerce.

value, however, represented the highest for imports in any year after 1929. After declining sharply in 1942 as leading sources of supply were cut off and transportation became difficult, the incoming trade showed an almost steady increase through 1945. The expansion was relatively small, however, for the Government, despite its assistance in developing Latin American resources, could not expand importations enough to replace pre-war supplies from Europe and the Far East. Advances represented for the most part larger imports from Western Hemisphere sources, although imports from other non-combat areas registered gains in 1944 and 1945, and trade with continental Europe and the Far East showed some increase, particularly in the latter half of 1945.

QUANTITY AND PRICE

In terms of quantity,[2] total exports

---

[2] "Quantity" in the sense here used for purposes of comparison is not synonymous with weight. Changes in quantity have been determined from the calculated index numbers shown in Table 2, which, based on values after elimination of variations in price, take into account the relative importance of each commodity in the trade.

TABLE 2

INDEXES OF CHANGES IN QUANTITY, UNIT VALUE, AND VALUE OF UNITED STATES EXPORTS AND IMPORTS

Year	Quantity	Unit Value	Value
Total exports of U. S. merchandise:[1]			
1936–38	100	100	100
1939	113	95	107
1940	132	102	135
1941	158	109	172
1942	207	132	274
1943	301	146	439
1944	289	167	484
1945	200	164[2]	328
Cash, or non-lend-lease, exports:			
1936–38	100	100	100
1941	135	109	147
1942	83	127	105
1943	63	136	85
1944	69	142	98
1945	96	144[3]	138
Imports:[4]			
1936–38	100	100	100
1939	94	98	92
1940	99	105	103
1941	117	112	131
1942	87	129	113
1943	97	141	138
1944	105	151	158
1945	107	155[5]	166

[1] Includes lend-lease exports from 1941 to 1945, inclusive.

[2] December estimated. The unit value of total exports rose to 171 in the first 8 months of 1945 but declined thereafter as commodity composition shifted from a predominance of lend-lease goods to articles of cash trade.

[3] Partly estimated.

[4] Imports for consumption.

[5] December estimated.

for 1945, cash and lend-lease, though declining 31 per cent from 1944, increased approximately 100 per cent from the average level of pre-war years 1936 to 1938. Cash exports, mounting steadily after 1943, increased approximately 39 per cent from 1944 but fell slightly under their pre-war volume and showed a decrease of 29 per cent as compared with 1941. Imports gained 2 per cent from the quantity of the preceding year and 7 per cent from 1936-38 but stood about 6 per cent and 9 per cent lower than in the high years of 1937 and 1941.

Price advances also contributed considerably to the high value of foreign trade during the war years. The unit value of total exports in 1945, though decreasing slightly from 1944, showed an advance of 64 per cent as compared with the 1936-38 level. Cash exports alone, expanding less in prices of individual items from pre-war than did leading commodities of the lend-lease trade, recorded a more moderate advance of 44 per cent. Imports rose 3 per cent in unit value over 1944 and 55 per cent from pre-war years. The advance for both imports and exports during the war was greatest in 1942 and tapered off thereafter.

Price and quantity indexes, shown in Table 2, measure the influence on value of trade of both price fluctuations and changes in volume.

As compared with the increase in trade during the First World War, a threefold expansion over pre-war years in volume of export trade in 1943 and 1944, the peak years of the Second World War, represented a much greater gain. Available indexes indicate that volume of exports in both these years approximately doubled the peak of the export movement in the First World War. However, the 1945 increase in unit value of exports over pre-war years was much more moderate than the advance recorded during and immediately following the first war. The rise of 71 per cent in the first eight months of 1945 compares with an advance of 110 per cent through 1918 and 159 per cent through 1920 over the pre-war 1911-14 average level. Indexes comparing the expansion of export trade during the First World War and the Second World War may be found in the annual review in THE AMERICAN YEAR BOOK for the year 1944.

RELATION OF IMPORTS AND EXPORTS TO U. S. PRODUCTION

Throughout the years, the United States has maintained self-sufficiency to an extraordinary degree, and during the war met an even smaller proportion of its consumption requirements by means of imports. The Government's ingenuity in developing substitutes to replace imported supplies and in directing distribution of strategic and critical materials nevertheless made possible an extraordinary expansion in production of movable goods in this country during the war. As compared with increases in imports of 58 per cent in 1944 and 66 per cent in 1945 over pre-war years (1936-38), United States production of movable goods more than doubled. The Department of Commerce places production at approximately $44,000,000,000 in 1937, $115,000,000,000 in 1944, and $103,000,000,000 in 1945.

While imports contributed less to national production during the war, the proportion of output exported showed a marked increase. Exportations amounting to 7½ per cent of production in 1937 and 1939 compare with proportionate parts of 12 per cent in 1944 and 9 per cent in 1945. At the peak of lend-lease shipments in the second quarter of 1944, exports represented at least 15 per cent of total production of movable goods.

TABLE 3

UNITED STATES PRODUCTION OF MOVABLE GOODS, VALUE OF EXPORTS, AND THE PROPORTION EXPORTED IN SELECTED YEARS[1]

(Production and exports in billions of dollars)

Year	Production of Movable Goods	Exports	Exports as Percentage of Production
1914	20.2	2.1	10
1919	47.5	7.8	16
1921	33.9	4.4	13
1925	47.2	4.8	10
1927	47.5	4.8	10
1929	53.2	5.2	10
1937	44.0	3.3	7½
1939	41.9	3.1	7½
1941	64.2	5.0	8
1943	113.1	12.8	11
1944	114.8	14.2	12
1945	102.9	9.6	9

[1] The data are from U. S. Department of Commerce *Statistical Abstract of the United States, 1944–45*, p. 525, and later estimates. As the figures are not adjusted for price changes, increases or decreases in absolute values should be disregarded.

These figures, as other statistics quoted in this review, take account only of the merchandise covered in foreign trade. Shipments, including equipment sent to United States armed forces abroad, were much larger. The relation of exports to production throughout the last three decades is shown in Table 3.

COMMODITY COMPOSITION OF EXPORTS

The broad economic classes into which export trade fell during the war years and their relative importance are shown in Table 4. Table 7 lists leading commodities.

Expansion in military goods marked the outstanding change in composition through 1944. This class of exports, consisting of aircraft, ordnance, firearms, ammunition, explosives, and other strictly military items, reached a peak value of $5,600,000,000 in both 1943 and 1944. It advanced to approximately two-fifths of total exports, rising from an average value of $54,000,000 in 1936-38, or less than 2 per cent of the total.

Next to implements of war, other manufactures, mainly commodities necessary to the war effort or essential to civilian economy, formed the most important export group. These articles advanced from an average of $1,378,000,000 in 1936-38 to $5,141,000,000 in 1944. They comprised, however, only 36 per cent of total exports as compared with 47 per cent in pre-war years, a reflection of the greater expansion in military exports. Similarly, exports of semi-manufactures, amounting to $1,096,000,000 in 1944, or double the pre-war value, dropped in proportionate part from 18 per cent to 8 per cent of total exports. Peak values recorded during the war for various manufactured commodities are as follows:

Machinery	$1,478,000,000	1944
Petroleum and products	901,000,000	1944
Automobiles, mainly motortrucks and parts	638,000,000	1944
Iron and steel-mill products	615,000,000	1943
Textile manufactures	496,000,000	1944
Chemicals and related products	403,000,000	1944
Nonferrous metals and manufactures	296,000,000	1944

Foodstuffs, like implements of war, reflected marked adaptation to wartime demands. Valued at approximately $1,766,000,000 in 1944, they amounted to nearly six times pre-war shipments. Foodstuffs formed 12.5 per cent of total exports, as compared with 10.5 per cent in 1936-38. Exports of meats, fats, and milk showed extraordinary expansion, and the group of edible animal products rose from a value of $63,000,000 in pre-war years to $1,296,000,000 in 1944. Exports of grain and other vegetable foodstuffs totaled $467,000,000 in 1944, about double the pre-war figure.

Exports of crude materials declined sharply in the early years of the war and did not regain their pre-war level in any year through 1944. Raw cotton dropped to a value of $83,000,000 in 1941 and unmanufactured tobacco to $65,000,000, or to approximately one-fourth and one-half the average values of the pre-war period (1936-38). European markets for cotton practically disappeared, and tobacco shipments to the United Kingdom dropped by two-fifths. Cotton exports averaged 652,000,000 pounds in 1942 through 1944 and tobacco exports 304,000,000 pounds, as compared with 2,880,000,000 pounds and 450,000,000 pounds in pre-war years. Although exports of coal increased considerably after 1941, mainly in response to the demands of Canadian industry, total exports of crude materials averaged only $545,000,000 in 1942-44, a considerable reduction from the value of $669,000,000

[1] Includes merchandise shipped under the provisions of the Lend-Lease Act of March 1941, which authorized the President to furnish, without current compensation, supplies to the government of any country whose defense he deemed vital to the defense of the United States.

[2] Semimanufactures included with finished manufactures.

[3] The term cash exports denotes non-lend-lease trade; the data include, besides cash purchases, merchandise shipped by private relief agencies and by UNRRA as follows: 1941 $40,000,000; 1942, $27,000,000; 1943, $58,000,000; 1944, $120,000,000; and 1945, $480,000,000. UNRRA shipments alone totaled $609,000 in 1944, and $351,000,000 in 1945.

for 1936-38. Crude materials made up only 4 per cent of total exports in 1944 as compared with 23 per cent before the war.

CASH AND LEND-LEASE

In response to the demands of countries resisting Axis aggression, particularly the United Kingdom and France, merchandise exported on a cash basis showed a marked increase in 1939 and 1940 and continued to increase in the early months of the following year, but in the late months of 1941 and in 1942, as the Government developed facilities for the transfer of military supplies on a lend-lease basis and assumed direction of production and distribution, the cash trade suffered drastic declines. By 1943 cash exports had narrowed to include mainly supplies for Western Hemisphere countries, which, after the outbreak of the war in Europe, relied heavily on the United States for such items as metals, textiles, chemicals, coal, and industrial machinery.

Lend-lease contributions to the war effort of the Allied Nations had by 1942 become predominant in the export trade (Table 5). In the peak year 1944, lend-lease shipments constituted 97 per cent of military exports, 68 per cent of exports of other manufactures, including semimanufactures, and 84 per cent of foodstuffs exported. Foodstuffs constituted the main class of supplies moved under lend-lease arrangements in 1941, but, although continuing to expand, were far outranked by military equipment and other finished manufactures in 1942 and succeeding years. Crude materials formed a relatively small part of lend-lease exports throughout the period of the war.

1945 TRADE SHIFTS

The end of the war, with its resulting decline in lend-lease shipments and increase in non-lend-lease exports, brought considerable shifts in the composition of trade in 1945. Military equipment comprised only 20 per cent of exports in 1945, whereas other manufactures increased to 45 per cent. Foodstuffs made up 18 per cent of exports and they are likely to continue high during the period of reconstruction in war-torn areas. Crude materials marked the outstanding change, with an expansion in shipments that raised their value from $554,000,000 in 1944 to $875,000,000 in 1945 and their share to 9 per cent of total exports.

Essential commodities continued predominant in export trade in the final months of 1945, although export

controls, so strictly enforced throughout the war period, were removed from most products, beginning in September (see McIntyre, Francis. "Removing War-Controls from U. S. Foreign Trade," U. S. Bureau of Foreign and Domestic Commerce *Foreign Commerce Weekly,* October 20, 1945, pp. 3-4, 25). Supplies sent by UNRRA and goods purchased by nations in the war theaters necessarily consisted of foodstuffs and basic commodities for reconstruction, and trade with other areas also continued to include largely the more essential commodities. Production of the less essential durables, such as passenger automobiles, electrical appliances, office machinery, and other similar manufactures so important in the pre-war export trade, had not proceeded rapidly enough by the end of the year to make large shipments possible, even to countries eager to secure them. Distribution of military exports, foodstuffs, and other commodities to leading countries and areas is shown in Table 6.

WORLD DISTRIBUTION OF TOTAL EXPORTS

The United Kingdom stands out as the main destination for United States exports in each of the war years. After 1941 the U.S.S.R. ranked second. Africa and the Near East advanced to third place in 1943, but during the following year, as zones of combat shifted and destinations changed, supplies for the African area showed a decline while those to the Far East rose. The proportion of United States exports destined to each of these four areas in 1944, the peak year of the wartime trade, was 37 per cent, 24 per cent, 7 per cent, and 9 per cent. These ratios compare with 17 per cent, 2 per cent, 5 per cent, and 19 per cent of pre-war shipments (Table 10).

Canada and the American Republics, which together took about one-third of total exports before the war, were also among the leading destinations for United States merchandise in each of the war years. Although receiving relatively small amounts of lend-lease goods, the Western Hemisphere countries constituted the main markets for cash exports. Since, however, the American trade showed smaller expansion than that with areas receiving large lend-lease supplies, it registered a decline to about 17 per cent of total exports in both 1943 and 1944.

Trade with continental Europe other than the U.S.S.R., which comprised 23 per cent of exports in 1936-38, was completely cut off in 1941 through 1943 except for small amounts with neutral countries. Considerable lend-lease and relief supplies going to Europe in 1944, and 1945 raised its share to 4 per cent and 15 per cent, respectively.

In 1945 the total export trade showed increases only with the American Republics and the continent of Europe. Although cash, or non-lend-lease, exports to a number of countries registered marked gains, declines in lend-lease shipments reduced total exports to each of the other leading countries and areas. The substantial growth in exports to the American republics represented larger sales to many of the individual countries, whereas the increase in trade with Europe included UNRRA shipments as well as larger purchases by neutral countries and liberated countries. Government missions from Belgium, France, and the Netherlands procured substantial amounts of United States merchandise in the latter half of the year.

LEND-LEASE SUPPLIES

Under the lend-lease program in operation approximately four and a half years, the United States exported $33,000,000,000 worth of merchandise to the United Nations. Forty-two per cent went to the United Kingdom, 29 per cent to U.S.S.R., 10 per cent to Africa and the Near East, and 12 per cent to the Far East. Together these areas received 93 per cent of total lend-lease shipments. The remaining 7 per cent covered supplies destined for Western Hemisphere areas, including those which Canada procured through lend-lease facilities but paid for.

Slightly more than one-third of all supplies furnished as lend-lease aid during the war years left the United States in 1944. During that year, merchandise valued at $5,100,000,000 went to the United Kingdom, $3,443,000,000 to the U.S.S.R., $746,000,000 to the African theater, and $1,204,000,000 to the Far East. The year represented the high point of shipments to each of the four areas except Africa and the Near East, which showed a decline from $1,588,000,000 in 1943. Value of lend-lease shipments to each area and its proportion in total United States exports is shown in Table 11.

EXPORT CASH TRADE

Under the impetus of arrangements for close integration of the economies of the United States and Canada, achieved under the Hyde Park Agreement, total exports to Canada rose from an average value of $454,000,000 in 1936-38 to approximately $1,440,000,000 in both 1943 and 1944. Of this amount, 84 per cent was classed as cash purchases. The remaining 16 per cent, or approximately $200,000,000, represented merchandise paid for but procured through lend-lease facilities and lend-lease shipments destined to other countries after further manufacture or assembly in Canada. Exports to Canada, which comprised 15 per cent of total export trade in 1936-38, amounted to 22 per cent of cash trade in 1941, 47 per cent in 1943, and 27 per cent in 1945, or nearly double the pre-war share. Total exports to Canada dropped to $1,178,000,000 in 1945, 95 per cent of which was classed as cash purchases.

Cash export trade with the American Republics increased from $485,000,000 in 1936-38 to approximately $1,230,000,000 in 1945, the maximum attained in the war years. Following a policy of assisting the other American Republics in maintaining their economies throughout the war, the Government allocated to them scarce commodities on a basis comparable with United States requirements. This procedure made possible exports of relatively large amounts of such necessary commodities as iron and steel, textiles, coal, wood pulp and paper, dyestuffs, medicinals, and other essential chemical products. Thus the United States to a considerable extent replaced sources of supply cut off during the war. Trade with Latin America comprised approximately one-third of total cash-purchase exports in both 1944 and 1945, or about double the pre-war share.

Cash exports to other leading areas declined steadily in value from 1941 through 1943. In the latter year, when total cash exports touched the low point of the war period, slightly less than 25 per cent of United States cash exports went to Eastern Hemisphere countries. During each of the following two years Africa, especially the Union of South Africa, Near Eastern countries, and India increased their purchases, as did also the United Kingdom and the continent of Europe, particularly after VE-Day. Nevertheless, goods taken by all Eastern Hemisphere areas formed only 40 per cent of total cash exports in 1945. Values for cash trade with continental Europe as shown in Table 11 include commodities exported for relief or charity by private agencies as well as by UNRRA. Such goods made up about 80 per cent and 60 per cent of so-called cash exports to Europe in 1944 and 1945, although they formed only 4 per cent and 11 per cent of total cash trade.

IMPORT TRENDS

The incoming trade of 1945 exhibited a distribution of merchandise into economic classes comparable to that of 1936-38. Crude materials and semimanufactures comprised 51 per cent of total imports, almost the same proportion as in the pre-war period, and foodstuffs and manufactures, representing 28 per cent and 20 per cent, varied little from that time (Table 4).

This distribution, although interesting, does not mean, however, that the import trade reverted to its pre-war commodity composition (Table 8). Wartime influences had not yet disappeared. Still lacking were manufactured goods from most of the continent of Europe and the large supplies of rubber, tin, silk, and sugar, formerly coming from Far Eastern areas. Raw materials and foodstuffs, predominant in the wartime trade from Western Hemisphere countries, continued to form the bulk of imported supplies. Even at the year's end, goods arriving from war areas formed only a small part of total imports.

Stimulated by the Government's

program for accumulating stocks of strategic materials, imports of crude materials and semimanufactures reached the highest level of the war period in 1941. Valued at $2,100,000,000, or two-thirds more than the pre-war 1936-38 average, these materials comprised 65 per cent of total imports. Although dropping by 20 per cent in 1942, as rubber, tin, and vegetable oils receded, crude and semimanufactured materials showed increases in each successive year, and in 1945 reached a total of $2,093,000,000. Wool, lumber, and metals were imported in relatively large amounts in each of the war years. Metals accounted mainly for the rise in 1945 over 1944, although wood pulp from Sweden in the latter half of the year and some increase in rubber from the Far East contributed.

Imported foodstuffs advanced to the unusually high level of $1,362,000,000 in 1944, mainly as a result of large importations of alcoholic spirits and grain. A decline in these commodities in 1945 lowered total foodstuffs to a value of $1,155,000,000, notwithstanding considerable expansion in vegetables, fruits, edible nuts, and candy, and a moderate increase in coffee.

Imports of finished manufactures other than military supplies from Canada barely maintained their value during the war years. Burlaps were well sustained except in 1942, and newsprint rose slightly in value, but other manufactures dropped under pre-war value despite marked gains in leather goods, cotton cloth, and jewelry from the American Republics. Imports of textiles from Switzerland and the United Kingdom also showed advances during 1945, nevertheless total textile imports amounted to barely three fifths the value of pre-war years. Among European manufactures, only watches and clocks arrived in relatively large amounts throughout the war. Swiss watches increased fivefold in value in 1943, 1944, and sixfold in 1945, as compared with 1936-38.

SOURCES OF IMPORTED MERCHANDISE

Canada and the American Republics supplied 73 per cent of United States imports in 1944 and 67 per cent in 1945, as against 35 per cent in 1936-38, an outstanding change in sources of supply. Imports from Canada expanded almost steadily from 1938 through 1944, and though showing a moderate decrease to $1,128,000,000 in 1945, were nevertheless three and one fourth times larger than in 1936-38. Imports from the American Republics rose steadily every year after 1938, except in 1942 when the ocean-shipping crisis interfered with the movement of supplies, and in 1945 reached $1,623,000,000, three times the pre-war value.

Among arrivals from Eastern Hemisphere areas, those from Africa and the Near East showed marked increases throughout the war, but in 1945, with a value of $448,000,000, comprised only 11 per cent of United States imports. Supplies from the United Kingdom and Far Eastern areas, steadily declining through 1944 and showing a moderate expansion in 1945, remained only fractionally as large as in pre-war years. Imports from continental Europe fell to one-tenth their pre-war value in 1942 and, though mounting in each successive year, recovered only to the extent of one half in 1945. Imports from the U.S.S.R., comprised largely of undressed fur skins, continued small as in pre-war years. Sources of supply and the part they played in war and pre-war years are shown in Tables 9 and 10.

(x) Less than $500,000.

Trade resuming or expanding after the end of the war represented mainly products from the United Kingdom and the continent of Europe. Leading British goods showing advances comprised leather gloves, unmanufactured wool, cotton cloth, linens, and worsteds. Imports from wartime inaccessible European countries included wood pulp from Sweden; diamonds from Belgium; flower bulbs from the Netherlands; brandy, essential oils, and floral essences from France; and leaf tobacco and rose oil from Bulgaria. The Far Eastern trade showed increases for rubber from Ceylon and British Malaya, rubber and pepper from India, bristles and wool from China, and abaca and copra from the Philippine Islands.

Although a considerable volume of goods arrived from the Far East throughout the war years, mainly commodities from India, Ceylon, Australia, and New Zealand, 1945 imports came to little more than half their pre-war value. The trade reflected the absence of sugar and coconut products from the Philippine Islands, rubber and tin from British Malaya and Netherlands Indies, tung oil from China, and raw silk and other products formerly purchased from Japan. Although China furnished some supplies, particularly tungsten and tin, throughout the period of the war, imports from that country in 1945 barely equaled one twelfth of the imports in the pre-war period 1936-38.

EXPORT-IMPORT BALANCE

Owing to expansions in shipments under the provisions of the Lend-Lease Act, the excess of merchandise exports over imports mounted many fold. Amounting to an average of $1,130,000,000 in 1938 through 1940, the export balance reached a maximum of $10,336,000,000 in 1944. As lend-lease shipments declined in 1945, the balance dropped to $5,670,000,000 for the year.

For many purposes, however, lend-lease shipments should be considered outside the scope of foreign-trade transactions. Omitting them, excess of exports over imports declined in 1941 and 1942, imports exceeded exports in 1943 and 1944, and exports were again the slightly higher of the two in 1945. These balances are shown in Table 1, along with balances including lend-lease shipments.

In contrast with transactions in the years 1938 through 1941, when large excesses of cash merchandise exports over merchandise imports were financed by imports of gold, the cash-import balances of recent years resulted in net outflows of gold. Net outward movements of gold, including earmarking operations, reduced United States stocks of gold every year from 1942 through 1945.

Excluding lend-lease shipments, imports of silver exceeded exports of silver in each year of the war. Net imports ranged from $41,000,000 to $18,000,000 annually as compared with an annual average of $158,000,000 in 1936-38.

Wartime trade with the Western Hemisphere featured a relatively greater expansion in imports than in exports, and the year 1945 continued to show a large import balance despite considerable expansion in the export trade with Latin America.

Imports from the American Republics, though falling slightly under exports in 1938 through 1940, a departure from the usual pre-war import balance, mounted rapidly during the war years. In both 1943 and 1944 imports exceeded exports by more than $500,000,000, and while imports showed less increase than exports in 1945, the balance of imports nevertheless totaled approximately $360,000,000. Thus the import balance showed a fourfold expansion over 1936 and 1937. In the five-year period 1941-45, merchandise imports from the American Republics exceeded merchandise exports by $1,800,000,000.

In trade with Canada, the excess of merchandise exports grew from $109,000.000 in the pre-war period 1936-38 to $617,000,000 in 1942. Thereafter, as the import trade showed greater expansion than exports, the export balance declined and in 1945 amounted to approximately $50,000,000. Both imports and exports, however, showed declines in value in 1945.

Trade with other countries during the war more nearly depicted the war effort of the United States than trends in commerce.

Exports to Eastern Hemisphere countries included merchandise, largely lend-lease, shipped to the armed forces or other representatives of the United Nations stationed in the country. A large part of United States exports to Italy and to North Africa, for example, consisted of supplies destined for the Allies during their operations in those theaters. Many goods recorded as exported to India were later flown to China. As already indicated, supplies going to United States forces abroad and that part which reached civilians through them are excluded from the statistics. Thus, for many countries and areas a balance of trade determined from the statistics of war years may be far from the true balance.

FOREIGN TRADE POLICIES *

By Henry Chalmers

Consultant on Commercial Policy, Department of Commerce

GENERAL

By the end of 1945 only limited progress had been made, except by the United States and a few foreign countries, toward demobilization of wartime controls and restrictions upon foreign trade. Resumption of trade with the areas formerly under Axis control has thus far been slow and uneven. Nor had much progress been made toward harmonizing the diverse commercial programs of the individual countries on the basis of common principles, in a concerted effort to facilitate the general revival and expansion of international trading. However, the prospect for greater progress in this field during 1946 was considerably improved by a number of developments late in 1945. These included the conclusion of the Anglo-American economic negotiations; the proposal by the United States, with British support, for an international conference on trade and employment within the coming year; and the completion of the necessary ratifications for setting up the Bretton Woods monetary and financial organizations.

The termination of hostilities in 1945 put an end to the forced commercial seclusion of most of Europe and of the Far East, and to the arbitrary diversion of the production and trade of those regions to the purposes of Germany and Japan. It also no longer made necessary many of the wartime trade restrictions that were resorted to by the United Nations in order to meet the overriding military demands upon the available supplies, funds, and shipping. Considering the drastic changes in the economic and financial position of so many countries wrought during the war, however, and the widely disorganized conditions left in its wake, a rapid or general return to pre-war trade relations could hardly have been expected.

The United States, Canada, the Union of South Africa, and a few other countries located outside the zones of active conflict had, by the end of 1945, taken substantial steps toward removing their various wartime restrictions upon foreign trade. Although usually continuing their price controls, these governments have gone far toward clearing the way for their nationals to resume the exportation and importation of most commodities under something like the pre-war pattern, in so far as the conditions set by other countries permitted.

Positive action toward trade resumption was taken by the substan-

---

tial enlargement of loanable funds of the Export-Import Bank of the United States and by Canada's new export credit facilities. As a result, these two countries were able to finance on credit the continued flow to their Allies of certain civilian goods which before the end of the war had been planned for shipment under the Lend-Lease or Mutual-Aid programs, also to finance new purchases of supplies urgently needed by various war-ravaged countries, beyond their current ability to offset with their export goods or with cash. Sweden and Switzerland also facilitated the restoration of international commerce through the extension of substantial official credits to a number of the other European countries.

Most countries, however, have felt that the particular economic and financial position in which they found themselves did not yet permit them to restore equally unrestricted conditions for foreign trading, until they could make many domestic readjustments in various fields and, in some cases, conclude financial arrangements with supplying countries.

The changes in the measures for foreign trade control actually made during 1945 varied considerably among the different regions or groups of countries, in the light of their special circumstances and immediate objectives.

LATIN AMERICA

In many of the Latin American countries, the wartime control of imports through joint arrangements with the United States has been succeeded by stronger local governmental controls, mainly through the wider adoption or application of direct import permit systems. Their principal concerns appear to see that their foreign exchange reserves and earnings are used primarily for the importation of essentials, especially productive equipment, and to shield certain war-developed local industries from severe foreign competition. However, both the newer import permit systems in Latin America and the older exchange controls were restrictively applied during 1945 to only a limited extent, and thus far appear to be largely precautionary measures.

BRITISH EMPIRE

Such relaxations of their wartime controls as most members of the British Empire have made during 1945—with the exception of Canada and South Africa, earlier noted—have been confined mainly to trade within the Empire, and with the few non-British members of the sterling area. Their inadequate holdings of non-sterling exchange, especially of dollars, has been the dominant consideration in their continuing, and sometimes even tightening, the existing restrictions upon trade with outside countries. The future trading possibilities of the entire sterling area with outside countries, notably with the United States, were involved in the Anglo-American financial negotiations held at Washington in the fall.

FORMER EUROPEAN NEUTRALS

On the European Continent, the four former neutral countries—Sweden, Switzerland, Spain, Portugal—had managed to continue commercial dealings both with the German-dominated areas and, irregularly, also with the outside world. The termination of the war apparently required no radical changes in the official controls over the foreign trade operations of their nationals. Sweden and Switzerland were exceptionally active during 1945 in reorienting and enlarging the range of their trade relations. Their governments assisted through agreements with other European countries for each to grant permits freely for the exportation of specified products to the other, with provision for official credits to cover temporary excesses in shipments to those other countries above what goods could now be obtained from them in return.

WESTERN EUROPE AND SCANDINAVIA

Among the former secluded areas of Europe, only the countries of western Europe and Scandinavia made any substantial progress during 1945 toward the general resumption of trade, with either other European or with overseas countries. The bulk of their importations during the year, particularly from the United States, was arranged through purchasing missions or other centralized agencies of their governments, if not actually carried through by them. All these governments stressed, however, that this arrangement is to be regarded as distinctly transitional. Thus far, overseas trade even with these countries has been more or less a one-sided movement, of goods shipped to them. The revival of sizable exports from them in most of their accustomed lines has to await the restoration of their domestic production to a point where they can spare much for shipment abroad, and often also deflation of their trade-inhibiting price levels and exchange rates.

Some beginnings have been made by a few of these liberated countries toward authorizing direct foreign importations on the part of their commercial firms. That is still quite limited as to the products covered, and official permission is required for each transaction, which needs to be sufficiently essential to the general import program of the country to warrant allocation of funds out of their inadequate exchange holdings or foreign credits. Gradual improvement in their internal economies, adjustment of exchange rates, and the currently active negotiation of foreign loans or credits, together should facilitate progress during the period ahead, both as to the total volume of the foreign trade of these countries, and as to the degree of direct participation in it of private commercial firms.

In the matter of resumption of trade and the methods of its control, Italy and Greece are in the same general position as western Europe.

EASTERN EUROPE

The state of political as well as economic unsettlement of most of the countries of eastern Europe,—in general, all east of Germany—the disrupted state of their transport, and the meager foreign exchange at their disposal, render more remote their resumption of any substantial imports from western European or overseas countries, beyond the relief shipments supplied by UNRRA. The extensive experimentation with state control of domestic industries that is going on in almost all of these countries, the close reorientation of the economies of several of them with that of the Soviet Union and, in the case of the former German satellites, the heavy deliveries to the Soviet Union called for under the reparations accounts, operate further to limit their early resumption of sizable trade with outside countries. There has yet been little indication from most of the governments of eastern Europe as to how much scope they contemplate for private trading.

In their present stage of military occupation and basic reorganization by the Allies, both Germany and Japan are as yet outside the scope of possible normal trade relations or policies. Soviet Russia has announced no changes during 1945 in its long-standing monopoly of foreign trade, and is not here specifically dealt with.

FAR EAST

In many of the formerly secluded areas of the Far East, the process of liberation from enemy control was going on through most of 1945. The present prospect is that governmental agencies or officially-designated commercial organizations will handle the external trade of many of these areas during the initial period of its resumption, with private transactions to be gradually restored, under governmental license. The greatest progress toward the restoration of normal trading has been made in the case of the Philippines. The recent lifting of centralized wartime controls by China, over most imports and some exports, is expected to facilitate trade resumption there, as soon as physical and financial limitations allow.

THE MONETARY FUND AND INTERNATIONAL BANK

The early setting up of the International Monetary Fund and the

International Bank for Reconstruction and Development was assured late in December, with their ratification by the great majority of the countries which had participated in the Bretton Woods Conference of the preceding year. Essentially, the Bretton Woods agreements make provision for the orderly adjustment of the exchange values of the various national currencies, for the tiding over of particular countries with temporary exchange difficulties, and for long-term loans under international auspices, for the reconstruction and productive development of the various member countries requiring them. Much is expected from this first venture in the broad, economic collaboration of the nations toward the revival of their commercial and financial relations on a stable and liberal basis.

These two financial institutions are expected to facilitate the transition from war to peace in international trade and finance in a number of ways. The operations of the International Monetary Fund are designed to minimize a repetition of the sudden and arbitrary exchange depreciations by countries acting alone, which made many long-term international transactions hazardous for a long period after the last war. Its program is calculated to combine substantial stability in the monetary relations of nations, with such flexibility as may be necessary to effect the adjustments called for in many countries after so disruptive a war. The provision for accommodation to countries experiencing temporary exchange shortages for conducting current business is intended to make it easier for countries maintaining restrictive exchange controls to relax them, and ultimately to eliminate them, and to make it less necessary for countries having difficulty in their balance of payments to resort to measures which would reduce or divert international trade.

Supplementing such loan or credit arrangements as may be worked out between individual countries, the International Bank is designed to assist the long-term financing of specific productive projects in the reconstruction and development of the member countries. Through the international guarantee it can offer, the Bank is expected to stimulate the revived flow of private funds into foreign loans and investments, as well as to provide direct loans out of its own governmentally-subscribed funds or others available to it, and incidentally to set sound standards for all operations of this character. It aims particularly to promote the long-range balanced growth of world commerce by encouraging international investment in the productive resources and facilities of the less developed countries.

ANGLO-AMERICAN CREDIT AGREEMENT AND ITS TRADE IMPLICATIONS

More limited in the scope of its participants, but promising to make possible the reopening of trade on a freer and more competitive basis with a considerable range of countries, were the Anglo-American discussions that were concluded in Washington early in December. Highly significant understandings in the field of commercial policy accompanied the two financial arrangements: the definitive settlement of all lend-lease obligations and war claims between the two countries, and the extension by the United States to the United Kingdom of a line of credit for new purchases, —together aggregating $4,400,000,000 —at moderate rates of interest and repayable in a flexible manner over a long term of years.

Through affording the United Kingdom the means for financing its exceptionally large import needs during the transition period, and for adjusting the heavy debts incurred during the war to the other members of the sterling area, the way was opened for several important trade-liberating measures. Exchange restrictions upon payments for current imports into the United Kingdom from the United States are to be lifted promptly upon the coming into effect of the credit arrangement. Within a year, any quantitative restrictions maintained on imports of particular products into the

United Kingdom are to be applied without discrimination against the products of the United States, and such sterling funds as may then be available to any of the Empire or other areas for current use are to be freely convertible for purchases in dollar countries or elsewhere. Finally, a program was launched for the early simultaneous negotiation of agreements for reductions of tariffs and trade preferences between the United States and a group of important trading countries, including all the British Empire countries.

PROSPECTIVE INTERNATIONAL CONFERENCE ON TRADE AND EMPLOYMENT

No less important, from a broader view, was the concurrence of the British and American governments in a set of basic principles and policies concerning the reduction of trade barriers and related matters, the general acceptance of which is expected to bring about a revival and enlargement of the trade of all countries, on a more liberal, multilateral and non-discriminatory basis. These proposals were promptly placed before the community of nations by the United States, as the basis for an international conference on trade and employment, now contemplated tentatively for the latter part of 1946. The broad program there proposed in the field of commercial policy, and the Bretton Woods agreements in the monetary and investment fields about to come into operation, were designed to supplement and reenforce each other, in promoting the restoration and expansion of the trade, employment and general prosperity of all participating countries.

PUBLIC ACCOUNTING

By Carman G. Blough
Director of Research, American Institute of Accountants

GENERAL

As in other years, developments in the field of Public Accounting during 1945 reflected the increasing use and importance of accounts in the management and direction of affairs both public and private. The end of the war and the beginnings of the reestablishment of peacetime industry and commerce brought new problems. The year's progress in the development of their solution refocused attention upon the nature of accounts and reemphasized the tentative character of accounting measurements. Accounting concepts have also been involved in developments in the areas of governmental regulation and control, governmental operation, and taxation. All of these developments are characterized by their recognition of the utilitarian nature of accounts.

TERMINATED WAR CONTRACTS

Although the problem of accounting for terminated war contracts is not one which arises only at the end of the war, a termination of the war contract of an individual contractor may well mark the end of the war operations of that company. Regulations for the accounting procedures to be used in the determination of the contractor's claim and his rights under the contract were developed continuously during the war period by governmental agencies and were released in numerous regulations and memoranda of the War and Navy Departments and the Office of Contract Settlement. These statements, however, were not concerned with the procedures necessary for the adequate reflection of the effect of the terminated contract in the financial statements of the contractor.

From the standpoint of the contractor, the termination of his contract gave rise to a claim against the Government, or a higher-tier contractor, for an amount representing costs expended upon the contract plus his profit allowance. Various procedures were suggested to account for the profit arising from such terminations and the reflection of the termination claim and profits in the financial statements of a war contractor. After its consideration of the general accounting principles applicable to the particular problems involved in a terminated contract, the committee on accounting procedure of the American Institute of Accountants in April, 1945 issued *Accounting Research Bulletin* No. 25, "Accounting for Terminated War Contracts."

The committee took the position that the amount of the claim arising at termination should be accounted for as a sale and that the cost elements applicable to that contract should be reflected in the regular operating accounts of the company. This treatment is recommended in spite of the fact that the amount of the contractor's claim may be difficult to determine at the effective date of termination. Under rules of accrual accounting, profit from a terminated contract would be recognized as having accrued at the effective date of the termination; accordingly, there should be an accounting for all reasonable estimates of the amount of the claim.

The summary statement of the conclusions expressed in *Accounting Research Bulletin* No. 25 with regard to these points found wide adoption in commercial practice and is here set down: "(1) The profit of a contractor on a fixed price supply contract terminated for the convenience of the government accrues as of the effective date of termination. (2) For the preparation of financial statements subsequent to termination, those parts of the termination claim which are reasonably determinable should be recorded; when the aggregate amount of the undeterminable elements is believed to be material, full disclosure with respect thereto should be made by footnote or otherwise. . . . (5) All of the contractor's own cost and profit elements included in the termination claim should preferably be accounted for as a sale, and separately disclosed if material in amount. The costs and expenses chargeable to the claim may then be given their usual classification in the accounts."

EXPENSES AND LOSSES ALLOCABLE TO WARTIME INCOME

It has been well recognized by accountants and others that the determination of the expenses and losses arising from wartime operations of a business is difficult. In many cases such expenses can not be finally determined until after the cessation of wartime operations; some of them will not be incurred except in the process of reconverting operations to a peacetime basis. During the war years it was suggested that these uncertainties be recognized by providing, in current financial statements, reserves for the expenses and losses attributable to wartime operations which might ultimately be determined. Many companies created such reserves either by charges to income or by charges to surplus.

The end of the war brought the problem of accounting for wartime expenses and losses and these so-called "post-war" reserves into prominence. The accounting treatment of such items has reflected the varying concepts of the nature and purpose of statements of income. From the view that periodic statements of income are useful solely as records to reflect historical segments of the totality of recognized revenues and expenses, the expenses and losses attributable to wartime operations which are incurred or determined subsequent to the cessation of wartime activity are to be reflected as charges in current statements of income. From the view that income statements are useful to reflect a measure of the result of the activities for a particular period of time and as such serve to provide an interpretive financial history, the expenses and losses to be reflected in the income statement of any one year may be only those expenses and losses which arise from the operations of that period or are allocable to its revenues.

During 1945 there was considerable

professional discussion directed to a consideration of these concepts and their applicability in the development of procedures for the reflection of expenses and losses attributable to wartime operation and for the treatment of "post-war" reserves. The year did not see a complete crystallization of views upon this point, but there was a wide expression of the opinion that statements of income would be most useful if the expenses and losses applicable to wartime operations, and hence allocable as charges against revenues of war years, were to be excluded from statements of income reporting revenues from peacetime activities and that "post-war" reserves which are found to be excessive should be returned directly to surplus so as not to affect the income reported in peacetime financial statements.

ACCOUNTING FOR EMERGENCY FACILITIES

During the war period, the Government issued many certificates of necessity applicable to facilities newly acquired or about to be acquired when it was determined that they were necessary for the production of war or essential civilian goods or services. Under the provisions of the Internal Revenue Code, the owner of the facility to whom the certificate of necessity was issued was permitted to deduct portions of the cost of the facility for tax purposes in such a manner that the entire cost might be amortized within a period of 60 months or less. While technically such accelerated amortization was applicable only in the determination of the tax liability, many companies applied the same rates of amortization in calculating the depreciation charge applicable to such properties in their financial accounts. As a result, at the end of a 60-month period, or earlier in case of an earlier certificate of nonnecessity or presidential declaration of the end of the "emergency period," the cost of such facilities would be reflected as fully depreciated in the accounts of the company.

Under general procedures of accounting, the amortization of the cost of depreciable property is related to its useful life, and corresponding proportionate charges to reflect the expiration of that cost are made in the periodic statements of income. While there is no suggestion in this procedure that the carrying value of depreciable property will reflect its current value, there is a presumption that the depreciation charges will reflect adequate consideration of the useful life of the property. The problem faced by companies having "emergency" facilities which have been depreciated at accelerated rates is that of determining whether or not the nominal or zero carrying value of such facilities is proper for the representations made by the company in its financial statements.

As in respect to the accounting treatment of the expenses and losses applicable to wartime operations, there are differences of opinion as to the manner in which this problem is to be solved. Accountants who hold one concept of financial statements suggest that the recording of depreciation at accelerated rates during the war years has resulted in the recovery of such costs, and that, accordingly, any corrections of these charges will be improper if such costs are again reflected in future statements. Accountants placing a different interpretation upon the purpose of financial statements emphasize the common importance attached to them with respect to the representations relating to the operating results of the company. From this view, if emergency facilities which have been fully amortized in the accounts are presently determined to have a substantial and continuing usefulness and value which is material in relation to the total property of the enterprise, an adjustment of the previously recorded depreciation or amortization would be made in order that statements of income purporting to represent the results of future operations may reflect a portion of the cost of using such facilities in those years.

As in other areas, accounting thought and practice has not completely crystallized. Many companies owning emergency facilities will continue to use them in their post-war operations and will make no adjustment of their carrying value; many others owning similar facilities will effect a restatement of carrying value in order that their statements of income may more nearly reflect the results of operations of future periods.

ACCOUNTING AND TAXES

The use of annual periods for summarizing and reporting the financial results of business operations underlies much of the difference between the principles and procedures of accounting and those of income-tax assessment. The estimates and approximations which are inherent in the determination of annual income for accounting purposes are in conflict with the greater definiteness and finality of measurement which are required for a uniform administration of an income-tax program. The differences between the accounting and the income-tax concepts of income are made increasingly important by variations in tax rates between years and by the high tax burdens of business enterprise.

Basically the tax and the accounting concepts of income differ as to the time at which items are to be considered taxable revenues or deductions from such revenues and as to the manner of reporting items affecting the determination of the tax assessment in annual statements of income. Financial accounts are usually kept upon an accrual basis, under which the recognition of revenues or expenses in any periodic report of income is determined by factors other than the receipt or disbursement of funds. For purposes of taxation, however, recognition and measurement of receipts and expenditures provide a convenient definiteness, and tax law and regulations reflect an increasing reliance upon such factors in the measurement of income subject to tax. Such income measurement, for example, results in the designation as income in the year of collection, payments received for certain types of services to be performed in the future. In terms of accounting concepts, such collections would not be recognized as income until the period in which the service was performed. Thus, the income statement of that annual period would reflect both the revenue, or part of the revenue, and its related cost or expense as determined in the performance of the service. The common recognition of these differences between tax and financial accounting is reflected in the numerous adjustments and reconciliations necessary to provide a comparison of the data reported in the income tax return with those reported in a statement of income, the keeping of duplicate or memoranda record data on different bases, etc.

There has not been common recognition of problems of financial reporting which may result from differences between data displayed in statements of income and those shown in the income-tax return. Such problems arise when items which are chargeable or deductible for tax purposes are not, in accordance with generally accepted accounting principles, reflected in the income statements. In such situations, illustrated by the deduction for tax purposes of unamortized debt discount and expense upon the refunding of a bond issue and a loss on the sale of capital assets charged to surplus, the income tax assessed during a period will not be completely related to the items of revenue and expense reported as determining the period's income in the income statement. If the transaction has resulted in a deduction for tax purposes, the net income reported in the income statement will be larger (because of a reduced tax assessment shown as an expense in the income statement) than it would have been had the transaction not been effected. Conversely, if the transaction has resulted in a taxable gain, the net income reported in the income statement will be smaller than it would otherwise have been. While the effect of such transactions is not often important, in some cases the amounts involved are sufficiently large to be of major significance.

After a lengthy consideration of this problem, the committee on accounting procedure of the American Institute of Accountants in December, 1944 issued *Accounting Research Bulletin* No. 23, "Accounting for Income Taxes." With respect to the statement presentation of the tax effect of items included in the computation of income taxes but not in the preparation of the income statement, the committee recommended that, when they are material, they should be reflected either by including the increase or reduction as an adjustment of the taxes for the period so that the amount of taxes shown in the income statement would be the amount payable upon the items shown in that statement, or by reporting in the statement of income a portion of the item as a charge or credit equivalent to its tax effect. Such procedures were designed to provide in the statement of income an amount which, designated as net income for the period, would reflect a charge for taxes equivalent only to the amount of taxes which would be payable on the items reported in the statement.

The procedures recommended in the Committee's bulletin were the subject of wide discussion and argument. The most authoritative criticism of the procedures suggested was voiced by the Securities and Exchange Commission in its *Accounting Series Release* No. 53, issued in November 1945. The Commission discussed the facts relating to the registration of securities by a public utility company to explain the various considerations underlying its conclusions in respect to "Charges in Lieu of Taxes." The Commission concluded that it would not be acceptable to it to report in a statement of income filed with the Commission any amount as taxes for the period other than that estimated to be actually payable in that year. However, the Commission recognized the propriety of a charge in the income statement equivalent to the tax reduction arising from the deduction for tax purposes of bond discount and expense on a refunded issue of bonds, deferred in the accounts, and from the loss on the sale of properties, charged to surplus in the accounts. The charge equivalent to the tax reduction was offset by reducing the company's deferred charge of bond discount and expense and the amount of the loss on the sale of properties charged to surplus.

ACCOUNTING PRINCIPLES IN GOVERNMENTAL REGULATIONS

Of the various areas in which governmental agencies have made use of the principles and procedures of accounting, none has provided as great a difference of opinion between professional accountants and governmental personnel as that represented by the regulation of public utilities. The authority given the Federal Power Commission to prescribe the accounting practices of the utility companies subject to its jurisdiction has been exercised in certain respects to provide methods of accounting for such utilities which are at variance with procedures consistent with generally accepted accounting principles. During 1945, the attention of the profession has been focused upon such differences as they relate to accounting for intangible assets.

In two cases, those involving issues before the Federal Power Commission in respect to the Montana Power Company and the Arkansas Power & Light Company, the conclusions reached by the Commission or its staff and the accounting treatment ordered or advocated by the staff were in conflict with the views of state regulatory agencies. In these cases, important differences arose over the possible existence of and the treatment to be accorded intangible assets of the utility company. During the acquisition of the companies which were combined to form the present utility, payments in excess of the "original cost" of the property of the individual companies were made by the present company. The accounting system prescribed by the Federal Power Commission requires that such payments in excess of "original cost" are to be reflected in an account designated as "Acquisition Cost Adjustments." The policies of the Federal Power Commission have generally effected a requirement that the balance of this account be written off immediately or amortized through charges to income during some relatively short period of time. In the cases referred to, the state utility commissions determined that certain of the prices paid to acquire a predecessor or to combine companies represented a prudent investment of funds and the acquisition of an intangible asset which had a substantial and a continuing usefulness. From the view that the intangible continued in existence and retained its value, these state commissions objected to any prescribed amortization.

The views of professional accountants in respect to intangible assets were generally summarized in a bulletin released by the committee on accounting procedure of the American Institute of Accountants in December, 1944. That committee in its *Accounting Research Bulletin* No. 24 classified intangibles into three categories: "(a) those having a term of existence limited by law, regulation, or agreement, or by their nature (such as patents, copyrights, leases, licenses, franchises for a fixed term, and goodwill as to which there is evidence of limited duration); (b) those having no such limited term of existence and as to which there is, at the time of acquisition, no indication of limited life (such as goodwill generally, going value, trade names, secret processes, subscription lists, perpetual franchises, and organization costs); and (c) the excess of a parent company's investment in the stock of a subsidiary over its equity in the net assets of the subsidiary as shown by the latter's books at the date of acquisition, in so far as that excess would be treated as an intangible in consolidated financial statements of the parent and the subsidiary. This class of asset may represent intangibles of either type (a) or type (b) above or a combination of both."

It is the expressed opinion of the Committee that, while the amortization of the cost of type (a) intangibles would be proper to reflect their limited usefulness, no such amortization is required for type (b) intangibles, although a company may at its discretion provide for their amortization. While professional accountants are not concerned, as accountants, with the problems faced by regulatory agencies in determining properly adequate rates to be charged by public utilities, they have generally objected to the argument frequently used in regulatory orders that the amortization of intangibles is required by generally accepted accounting principles. The view of professional accountants is that, if such amortization as may be prescribed in reference to intangible assets determined to have a substantial and continuing value is necessitated by regulatory concepts or procedures, orders effecting such amortization should indicate that the prescribed treatment is required by those concepts and procedures and not by generally accepted accounting principles.

AUDITING

In the work of auditing, public accountants have been faced with the problems resulting from restricted manpower, etc., caused by the war. While such problems necessitate a re-examination and study of auditing procedures to improve auditing proficiency, no major modifications of those procedures were made during the year.

One problem of basic professional interest is that of the auditor's responsibility for published financial data and the extent to which such responsibility may continue beyond the time at which the auditor has completed his examination of the client's statements and accounts. In regard to the former, the committee on auditing procedure of the American Institute of Accountants issued, in May, 1945, its Statement on Auditing Procedure No. 22, "References to the Independent Accountant in Securities Registrations." The purpose of the statement was to review the liabilities imposed upon the accountant as an expert under the Securities Act of

1933, and to recommend statements to be used in registration statements and prospectuses which would indicate clearly the relationship of the auditor to the financial data presented therein. Although it is generally recognized that financial statements are primarily the statements and representations of the company, language has been sometimes used in registration statements which might be interpreted to suggest that the auditor named as an expert had prepared the financial data and that they were presented upon his authority as an expert.

The committee on auditing procedure suggested terminology to be used when financial statements, earning tables, historical financial information, etc. are referred to in a registration statement or prospectus. The suggested terminology provides a clear statement or report that the accountant, in his capacity as an independent expert, has examined the financial statements which are, however, the representation of the registrant, and that the expert opinion of the accountant should be read in conjunction with those representations.

Opinion in respect to the auditor's responsibility for the disclosure of the effect of events which have occurred subsequent to the termination of his examination has not crystallized. The problem arises in those situations in which the accountant is asked to give his consent to the use of his certificate to accompany financial statements incorporated in securities registration statements or prospectuses some time after the completion of the auditor's examination. In such cases, events occurring subsequent to the completion of the auditor's examination and prior to the release of his consent to the use of his certificate may have a material effect upon the representations contained in the financial statements. It is generally believed that, when such events have been brought to the attention of the accountant prior to his giving his consent to the use of his certificate, he should insist upon their disclosure before doing so. However, in view of the fact that the auditor's opinion with respect to financial statements is determined only as the result of an examination, it is believed that he has no primary responsibility for the determination of the existence or non-existence of events or situations which might have a material effect upon the representations contained in the financial statements after he has completed his examination.

LEGISLATION

The year 1945 was marked by the extension of state legislation affecting public accountants by providing restrictions upon the practice of public accounting by persons who may be unqualified. The purpose of such legislation is to protect public interest by restricting the use of designations indicating competence by accounting practitioners and the expression of opinions, upon which third parties may rely, by unqualified persons. The pattern of such legislation provides for the registration, after its enactment, of two types of persons: (1) "public accountants," those persons who are not certified public accountants but who are currently engaged in the practice of public accounting, and (2) certified public accountants. The affixing of a signature with any wording indicating that he is an accountant or auditor, or that he has expert knowledge in accounting or auditing, to any accounting or financial statement or to any opinion on, report on, or certificate to any accounting or financial statement, is restricted to registered persons. The designation "public accountant" is limited to those persons who registered under the act at the time of its passage. The effect of the legislation in respect to the limited registration of "public accountants" is to provide that in future years the practice of public accounting will be eventually restricted to those persons who can qualify under the act as "certified public accountants" by meeting the designated educational and examinational requirements. During the year, Texas and California enacted such laws, to bring the total number of states and territories providing such regulatory legislation to 17.

GOVERNMENTAL ACCOUNTING AND AUDITING

Recent developments in the field of Federal governmental accounting and auditing have resulted from the efforts of many persons to get an application of modern commercial accounting practices to the accounts of the Federal Government. In 1945, the George bill (S. 375) was passed as Public Law No. 4. A section of that law provides that the financial transactions of all government corporations be audited by the General Accounting Office in accordance with principles and procedures applicable to commercial corporate transactions. It also provides that a report of each audit shall be made by the Comptroller General to the Congress not later than six and one-half months following the close of the fiscal year, shall set forth the scope of the audit, and shall include statements of assets and liabilities, capital and surplus or deficit, analysis of surplus or deficit and income and expense.

Following the passage of that legislation and other enabling acts, there was created within the General Accounting Office a division of Corporation Audits. The appointment of a director of the Corporation Audits Division and his administrative assistants brought persons with wide experience in both public and governmental accounting practice into the division.

Congressional interest in the problem is further evidenced by the introduction and enactment as Public Law No. 248 in December, 1945, of the Whittington bill (H.R. 3660). This law requires "wholly owned" government corporations to submit annually to the President and the Bureau of the Budget a business-type budget plan of operations providing for needed flexibility in order that authorized activities may be properly conducted. There is no requirement for submission of budgets by "mixed ownership" government corporations, but both types are required to have their financial transactions audited by the General Accounting Office in accordance with the principles and procedures applicable to commercial corporate activities. The report of the General Accounting Office audit is to be submitted to Congress each year, together with comments and information deemed necessary to keep Congress informed of the operations and financial conditions of the corporations, pertinent recommendations of the Comptroller General, and transactions observed in the course of the audit which, in the opinion of the Comptroller General, are without authority at law.

This legislation, and requests by governmental representatives for professional assistance in making recommendations for the improvement of the accounting practices within the Federal Government and in assisting in the creation and organization of the Corporation Audits Division, are evidence of increasing recognition given to the need for the modernization and improvement of the accounts of the Federal Government.

TAX POLICY

Much of the controversy relating to taxation and many of the conflicts between principles of taxation and of accounting are the result of a lack of a sound and basic tax law. Since the passage of the 16th Amendment permitting a Federal direct tax upon income, tax laws have generally reflected legislative expedients deemed necessary to provide the revenues immediately required. As a result, those laws and their related regulations have developed into a confusing patchwork within which there appears little pattern of a basic and consistent program or policy of taxation. It has been frequently suggested that a satisfactory reconciliation of these difficulties may only be secured by re-examination of the whole area of Federal taxation, the determination of a basic tax policy, and the consistent application of that policy through the years, with variations in needed revenues being made by variations in tax rates. Professional accountants have continued to make recommendations favoring such a program. Organizations of professional accountants have officially urged the creation, by Congress, of a nonpartisan tax commission which could suggest the development of a basic tax policy and recommend its adoption. Individual accountants have assisted in research studies for the purpose of recommending such a program. During 1945, one such study was published as *A Tax Program for a Solvent America* by the committee on post-war tax policy. This committee, whose work was made possible by grants from the Faulk Foundation, was composed of outstanding representatives of the academic, financial, legal, and public accounting fields.

CONCLUSION

The accounting problems created by the war and those which arise from its termination demonstrate the need for a continuing study of the basic concepts underlying accounting principles and adaptation of them to changing economic and social modes of thought. Important areas still are largely unexplored, and with the decreasing importance of the immediate problems of war and reconversion, it can be hoped that the continued study of the use of accounts will provide clarification of the basic concepts of income, cost and value, nature and purpose of statements of income, inventories, etc. The war period has amply illustrated the need for continuous evolution and development of accounting principles and practices, and has demonstrated that the significance of accounts rests upon the essential usefulness of accounting concepts.

LIFE INSURANCE

By James S. Elston
Assistant Actuary, The Travelers Insurance Company

INSURANCE IN FORCE IN PRIVATE COMPANIES

The legal reserve life insurance in force in private companies Dec. 31, 1945 is estimated to have been about $154,600,000,000, nearly 4 per cent greater than at the end of 1944. The new paid-for business for the year, not including revivals or increases, is estimated at $15,300,000,000, an increase of about 5 per cent over 1944. Comparatively less insurance has lapsed or has been surrendered than ever before. The combined assets are estimated at $44,750,000,000, and the payments to policyholders and beneficiaries at $2,700,000,000.

OTHER INSURANCE IN FORCE

There is also in force about $7,000,000,000 insurance in fraternal orders and assessment organizations, $2,500,000,000 U. S. Government life insurance on veterans of the First World War, about $135,000,000,000 as of July 18, 1945 National Service Life Insurance on members of the armed forces and veterans of the Second World War, and the life insurance value of survivors' benefits for widows and orphans under the Old Age Security Act estimated to be about $67,000,000,000.

NATIONAL SERVICE INSURANCE

A great amount of the National Service Life Insurance, however, has since lapsed, estimates of the proportion lapsed on separation from service varying but running as high as 80 per cent. Prevention of such lapsation and restoration of insurance already lapsed is recognized as highly desirable, and the life insurance business is attempting to do all it can to help. Companies have urged their agents to advise the veterans to retain their insurance and to answer their questions about it. The most recent general step is the holding of about 400 proposed seminars throughout the country by the life underwriters associations to help equip their members with the knowledge that will best enable them to help most.

LEGAL RESERVE LIFE INSURANCE *

(Dollars in Millions)

LIFE ANNUITIES

At the beginning of the year there were over 2,500,000 life annuities in force for an aggregate annual income of $800,000,000, of which $191,000,000 was actually being paid, $277,000,000 deferred but paid-for, and the balance being paid for. The total was divided between $503,000,000 individual annuities, $240,000,000 group annuities covering 1,500,000 American workers, an increase of 75 per cent during the war, and the balance supplementary contracts involving life contingencies payable to insured after maturity of endowments and to beneficiaries after death of the insured. Last year 39 per cent of the amount of maturing benefits was left as trust funds with the companies for future payment, mostly in instalments. This ratio has been increasing rapidly and is five times as great as 15 years ago. Much of these funds were available for spending if they had not been left with the insurance company by the recipient. This represents intelligent family planning and sound financing for the future welfare of American homes, but it is also an important additional contribution to the anti-inflationary saving of the nation.

INTEREST RATES ON NEW INVESTMENTS

As has been emphasized in previous reviews, one of the most important, if not the most important, problems is the continued low rate of interest earned on new investments. Unless this rate increases, the cost of life insurance will increase gradually (except as counteracted by an improved mortality rate) until the average rate on all investments, including old investments at high rates, approximately equals the rate on new investments.

Representatives of the life insurance business were invited in 1945 by the Secretary of the Treasury to a conference to consider the Treasury's objectives in the Seventh War Loan and later in the Victory Loan. A research committee has been conducting research as to the relationship of life insurance and the public debt so that the problems and ideas of the business in connection with government finance can be given to the Treasury, the Federal Reserve Board, and other interested Washington officials, and in turn so that the wishes and ideas of the Treasury may be interpreted to the business.

The Treasury's prime responsibility is to manage the debt in the best interests of all the people. The insurance business should not hope nor ask for special treatment, but there are 70,000,000 policyholders, who constitute a considerable part of the whole population, and it seems that the business should attempt to make their interests thoroughly understood and to emphasize to the Treasury the constructive role which they can fill as present and prospective owners of a very significant proportion of the long-term debt. About $20,800,000,000, or approximately half of the life insurance assets, are now held in government bonds.

The life insurance companies have drawn up plans for expanded financing of home building and expect a big growth in the years ahead in the home mortgage field. They will have at least $1,000,000,000 annually to invest in mortgages, mostly in the financing of homes, provided building costs do not become excessive. They now own nearly one-third of all FHA mortgages. There is a need for otherwise broadening of the investment base so that there will be more avenues for the use of funds, which might include high grade common and preferred stocks and other income producing properties and classes of investments not now permitted. Some state laws have been revised recently to this effect but more revisions are needed. Investment in stocks would make funds available for the capital needs of industry. The research committee has proposed to the National Association of Insurance Commissioners a plan citing the excellent record of high grade preferred stocks over the past 20 years as to value and yields and pointing out their suitability for life insurance investment except for the factor of wide fluctuation in market prices under abnormal conditions and suggesting that in annual statements such stocks be valued by a new proposed formula which would level off the effect of the fluctuations.

QUESTION OF CONSTITUTIONALITY OF STATE PREMIUM TAX LAWS

After the United States Supreme Court, in the Southeastern Underwriters Association case, declared that insurance was commerce subject to Federal regulation, considerable difference of opinion arose as to the effects on the insurance business because for 100 years it had been under state regulation. Life companies had been voluntarily complying with the labor laws before the decision, and no question has been raised about them not having complied with other Federal laws. No one can predict the ultimate effect of such a great change, but the principal immediate question was as to whether state premium tax laws which discriminate in favor of local companies are constitutional. Taxes were paid in 1945 by most companies in all states, but active contests were instituted in 16 states by comparatively few companies whose executives concluded that this was the only safe way to protect their policyholders if it should be proved that the laws are unconstitutional. Decisions reached in the lower courts so far have been diverse but in the few highest state courts reached all have been in favor of the states. It will be several months before any case is passed upon by the United States Supreme Court.

To clarify the situation until the problems involved have been fully discussed and plans instituted for meeting them, Congress in March 1945 passed Public Law 15 which provided "that the continued regulation and taxation by the several states of the business of insurance is in the public interest"; and that the business of insurance shall be subject to the laws of the several states and "no act of Congress shall be construed to invalidate, impair, or supersede any law enacted by any state for the purpose of regulating the business of insurance, or which imposes a fee or tax upon such business unless such act specifically relates to the business of insurance, provided that after Jan. 1, 1948," but not before, the Sherman Act, the Clayton Act and "the Federal Trade Commissions Act shall be applicable to the business of insurance to the extent that such business is not regulated by state laws," but nothing shall render the said Sherman Act inapplicable to any agreement or act of boycott, coercion, or intimidation, and nothing herein shall affect the application to the business of insurance of the National Labor Relations Act, the Fair Labor Standards Act, or the Merchant Marine Act.

ELIMINATION OF WAR CLAUSE IN POLICIES

A survey by the Institute of Life Insurance of 156 companies made within 30 days of V-J Day showed that 66 per cent of the companies had already eliminated the war clause from all new policies being issued and that there were only 6 per cent of the companies not then considering the change. Nearly all the companies have now eliminated it in old as well as new policies. Action was taken by some companies within 24 hours of the cessation of hostilities in the far Pacific.

The war clause was generally adopted at the outbreak of the war for new policies issued, in the interest of the existing 66,000,000 policyholders. It was recognized that there might be a rush for insurance protection by the millions going into the armed forces, which would unduly weight the claim payments in the case of heavy battle losses. The Government provided up to $10,000 of National Service Life Insurance for each man or woman in the service, assuming the extra hazard which was not within the normal expectations of policy coverage. Practically all civilian policies already in force at that time carried no war clause, and death benefit payments in excess of $250,000,000 on the lives of servicemen have been paid under those pre-war policies. Some measure of the hazard involved during the war may be seen in the Veterans Administration figures showing well over $2,000,000,000 paid out in death claims under National Service Life Insurance. Some companies which had used "status" clauses excluding death while serving abroad in the war, announced settlement of claims on a "cause" basis, death caused by war, where such interpretation was more favorable to the beneficiary. At least one company indicated that it would review all war claims and probably pay them in full.

AIR PASSENGER TRAVEL COVERAGE

World-wide airline passenger travel without limitation is now regarded as a standard risk in the issuance of new life insurance policies by about one-half of the 100 life insurance companies (representing more than 80 per cent of the total insurance in force) included in a survey on post-war practices made in the autumn of 1945 by the Institute of Life Insurance. Such coverage is furnished by the other companies at extra premiums depending on the individual circumstances. Underwriting of pilots and crew members and of those using private pleasure or business planes has also been liberalized this year.

LIFE INSURANCE MEDICAL RESEARCH FUND

The Life Insurance Medical Research Fund has been organized, including 137 United States companies having over 92 per cent of the total amount of life insurance outstanding in all United States companies, and in addition 10 Canadian companies which contribute on the basis of their United States business. It is planned to invest about $3,500,000 over a period of six years in medical research aimed to improve the health and lower the mortality rate in the country, concentrating on supporting existing institutions in conducting research into the causes and cure of cardiovascular diseases. The first grants have been made to six prominent medical schools. Funds will also be allocated to support men in research who, without this aid, would be unable to enter this field.

These diseases were chosen first because of their primary importance to the public and to life insurance policyholders. They are the chief cause of death in the United States, causing during the war about five times as many deaths as the combat deaths in all branches of the armed forces. Another reason for the choice is that relatively little money is being spent otherwise in research in this field.

GROUP LIFE INSURANCE

Special attention was called to one purpose of life insurance when the papers reported that President Roosevelt had over $500,000 insurance in favor of the Georgia Warm Springs Foundation. It appears that some companies which have never transacted group insurance are entering that field.

A legal definition of group life insurance and its accompanying standard policy provisions were adopted nearly 30 years ago by some of the most important states. Since then considerable demand has developed for coverage outside the definition and many such contracts have been issued in states where no legal restrictions exist and after various successive changes of laws to cover particular situations in other states. A general survey of all developments, actual and probable, has been reported to the National Association of Insurance

Commissioners. It is hoped that, after more thorough study and discussion, actual suggested laws may be drafted and recommended by them for adoption by the states. Some of the principal changes recommended are: (1) extension of the definition so as to permit coverage on members of labor unions and debtors of a creditor; (2) recognition of extensions of coverage to employees of subsidiaries and affiliates of the policyholder; and (3) reduction of the minimum requirement from 50 to 25 lives.

The report includes a discussion of topics of current legislative interest on which unanimity of opinion has not been reached: (1) group insurance issued to the trustees of a fund established by two or more employers in the same industry, usually pursuant to collective bargaining agreements with labor unions; (2) group insurance on associations of employers, allowing a single policy to cover the employees of two or more employers associated only through some tie such as common membership in a trade association; and (3) group insurance issued to associations of employees and on other organizations where an employer contribution toward the cost of the insurance is impractical or impossible.

The Guertin bill endorsed by the state insurance commissioners and embodying the consensus of actuarial opinion as to the best standard nonforfeiture and valuation provisions has been adopted in nine more states, thus making 34 embracing 68 per cent of the population of the country for which companies can make the same plans for adopting a scientific formula for nonforfeiture values, and basing them on modern mortality tables, the Commissioners Standard Ordinary Mortality Table, and the 1941 Standard Industrial Table. It is hoped that New York State will soon cooperate, especially as it is felt that most of the other remaining states would follow suit. Other companies have also adopted more conservative reserve bases for business hereafter issued, by using a lower rate of interest than formerly.

EXTENSION OF SOCIAL SECURITY COVERAGE

In the spring of 1945, a Social Security report was published by a committee for the life insurance business, representing the culmination of years of study by the best qualified men in the companies. This included recommendations for the extension of old age and survivors' insurance and of unemployment insurance to classes of the population not now covered and of other actions to strengthen the system but also discussed other proposals for extension of which there is considerable doubt, pending further study, about their advisability for the ultimate good of the country. A thorough understanding should be attained, not only by a few but by the people, of the total comparative costs involved. The question is not one merely of statistics but of general economics and psychology.

The New York Times, stating that experts in the life insurance business should have a peculiarly valuable contribution to make to the study of Social Security, noted that all the committee's "recommendations, however, for an extension of the Social Security system are made subject to one extremely important qualification: For the individuals of an unregimented state to supply the necessary drive and to work together for economic progress, it is essential to have an effective system of rewards and incentives to make it worth their while, economically at least, to take risks and put forth efforts. To maintain proper incentives to work, Social Security should be determined by the level of subsistence. In a free country where people can work or not, as they like, the benefits of Social Security must be appreciably below what the individual ordinarily regards as a satisfactory standard of living for himself. This qualification must be kept consistently in mind in all proposals to improve Social Security if we are to maintain the health of the whole economy, upon which any Social Security system must depend." The Ways and Means Committee of the

House of Representatives has set up a staff of experts to study the costs of the present and proposed extended coverages of social security.

FIRE INSURANCE

By Edward R. Hardy

Secretary-Treasurer, Insurance Institute of America, Inc.

FIRE LOSSES

The statistics quoted under this heading are from the National Board of Fire Underwriters whose statistics have been compiled on the same basis for many years. It is possible by using this source to enable the comparisons from year to year to have value. For 1945, it shows that losses were $32,000,000 larger than for 1944, as compared with $75,000,000 larger than for 1943. There does not appear to be any outstanding losses which might be called conflagrations and so increase this amount. Perhaps the increase was owing to the large number of fires but more probably to the fact that, with the increased values now prevailing, the same amount of fire in a given property will naturally make for a larger loss. It may again be emphasized that there has not been time since the cessation of hostilities wholly to re-establish the fire prevention work on the previous high plane. In time, that will come but not immediately. The loss table presented is for the three years noted and is an excellent comparison, not only for the losses month by month for these three years, but for the totals for the three years, 1943 to 1945 inclusive.

SABOTAGE

Now that hostilities have ceased, it is possible to make statements in regard to sabotage which, while they were held to be true in previous years, required the close of hostilities to bring to light the necessary authentic facts. The best opinion is that throughout the period of war there was little, if any, loss caused by sabotage. One excellent authority stated that there was one loss, and that a small one, where he thought sabotage might have entered into the cause of the fire. Even in that case he felt that it was doubtful. There may have been on the part of the enemies of the Allies some hope, at least, if not expectation, that their nationals might attempt to damage the properties in which they were employed. There is no evidence that such was a fact and there is no real evidence that any such expectation was held. Nevertheless, it is well to record that at the conclusion of hostilities there is nothing to show that any attempt at sabo-

FIRE LOSSES BY MONTHS

	1943	1944	1945
January	$27,733,000	$38,572,000	$44,865,000
February	33,175,000	38,280,000	41,457,000
March	39,214,000	39,084,000	40,876,000
April	34,241,000	34,746,000	37,950,000
May	29,297,000	32,815,000	34,153,000
June	26,854,000	30,555,000	34,090,000
July	25,016,000	32,706,000	34,054,000
August	29,193,000	30,618,000	34,096,000
September	26,488,000	31,448,000	32,447,000
October	29,661,000	32,173,000	34,470,000
November	31,647,000	33,847,000	37,393,000
December	47,716,000	48,694,000	49,478,000
Total 12-months	$380,235,000	$423,538,000	$455,329,000

tage was made. Perhaps it is well to state that by sabotage is meant an attempt to bring about the form of loss covered by the policy in force. This would apply to all forms of insurance but is more apt to occur, if it does occur, in fire insurance.

OUTGROWTH OF THE ATLANTA CASE

The chief problem before the insurance companies, and this applies to all of them, is the outgrowth of the Atlanta decision (June 1944) of the Supreme Court of the United States overturning the decision in *Paul v. Virginia,* the details of which are fully set forth in THE AMERICAN YEAR BOOK for 1944. What is herewith presented is the outgrowth of that decision. It was appreciated by everyone engaged in the business of insurance, and by the United States Government, too, as well as the state governments, that to overturn the stated practices of 75 years based on a Supreme Court decision was so far reaching as practically to make havoc of the business. A conclusion was reached and a law passed to that effect which permits the insurance companies to make readjustments so as to line their business up with the states and the United States Government. In other words, to work out a plan which would harmonize the conduct of the business with the Supreme Court decision of 1943. It was realized that this would take time, and the law passed by Congress granted this time up to Jan. 1, 1948. If acceptable provisions have not been made and adopted by that time then the United States Government will take hold of the matter. The companies are diligently at work on the problem and will probably be able to present an acceptable plan by the time set.

OFF PREMISES LOSS

Two or three forms of insurance written by fire companies might be mentioned because they occasionally produce large losses. One such is damage by hurricane. In Miami, Fla., a hurricane resulted in an estimated loss of $50,000,000. A high percentage of this loss was on government property and did not affect the private companies because there was no insurance. Another hurricane occurred in Texas but the loss there was limited to an estimate of $2,000,000, and it can readily be seen how these losses come up. Another form of loss is that known as the "Off Premises" loss. Sometimes, instead of reducing the rate, the coverage, as it is called, will be extended. In other words, the loss will not be limited to the premises in which the fire occurs but to the property of the insured, which for one reason or another is not on the premises. An excellent example is that of a cleaning and dyeing establishment where a great deal of this type of insurance is involved because of the extended cover to include loss off the premises. This is limited to 10 per cent but, like all adventures under extended cover, it can bring losses which are disturbing to the underwriter. However, it is the province of insurance to cover losses, and in one way or another the policies of insurance must provide for them. One reason why the insurance business has grown to be so large and important is because it has been willing to make provision for new forms of loss.

THE STANDARD POLICY OF FIRE INSURANCE

The present policy, which was first adopted in New York State on July 1, 1943, has now been adopted by 42 states and Alaska and Hawaii. In a few states minor changes have been made and in Kansas it did not go into effect until Feb. 15, 1946. This shows, however, a most commendable attempt on the part of the fire insurance companies to standardize the basic contract for the whole country. This will be one big step toward working out the necessary laws by Jan. 1, 1948.

CASUALTY AND FIRE COVERAGE UNDER ONE POLICY

Practically all of the English companies have charters which permit them to write all forms of insurance and do not of necessity, in most cases, require a specific policy for a specific purpose. In the United States, the development was along single lines as companies were chartered for fire insurance, casualty insurance, etc., and limited to that form of coverage. Some 40 years ago, the casualty business began to be developed to large proportions by companies organized for that purpose. A fair amount of casualty insurance is based, of course, on legal liability and differs from fire insurance which is based on indemnity. With the development of business, big and small, it became necessary to have coverage for both of these forms, and others which may come under Life but need not be considered now.

There is a growing demand that the fire policy shall include to a certain extent, at least, coverage for some forms of casualty insurance. This probably would not apply to Workmen's Compensation insurance which is rather closely controlled by the states. In the case of a person owning his own home, and having a car in an adjoining garage, insuring both under the one policy might well be desired. This is merely an illustration. Just how far the movement will go is impossible to say, but the probabilities are that within a few years, five would be a reasonable estimate, such will be the usual form and not two policies as at present. It is to be desired that as few pieces of paper as possible be used in transacting business, and it can readily be seen that if one policy can include all of the essential needs there will be a substantial gain in clerical work to say nothing of other savings. Those who oppose the matter are not to be dismissed lightly because of the fact that their training is largely in one branch, and they are inclined to view things from that point of view, but like all things in business the problem will be solved and in the not too distant future.

1945 RECEIPTS

The last year for which complete statistics are available (1943) showed that fire premiums amounted to $1,154,000,000. The total income, including interest, rents, etc., amounted to $1,275,000,000. The losses paid amounted to $554,000,000, and the total disbursements, including all forms of expenses, amounted to $1,151,000,000. Complete statistics for 1945 will probably show premiums receipts of approximately $1,350,000,000. Without much change in the income including interest, rents, etc., the losses will run about 50 per cent of the premium receipts.

CASUALTY INSURANCE AND CORPORATE SURETYSHIP

By William Leslie

General Manager, National Bureau of Casualty and Surety Underwriters

THE ACCIDENT RECORD

Consistently following mileage trends, traffic accidents during the first two months of 1945 continued downward. Increased use of the automobile during the three following months brought an average increase in fatalities of approximately 3 per cent over the preceding year. However, with the relaxation of restrictions, June showed an increase of 11 per cent over the corresponding month of 1944; July, 15 per cent; August, 26 per cent; September, 40 per cent; October, 53 per cent; and November, 40 per cent. This rapid monthly increase over 1944 clearly indicates that the complete record for 1945 will not be a good one, and the National Safety Council estimates 29,000 fatalities for the year, an increase over 1944 of 20 per cent. With little hope of improvement during the early part of 1946, the situation assumes an extremely serious aspect and one which calls for far stricter enforcement of traffic laws and more concerted drives by those organizations and officials concerned with the problem.

In the occupational, home, and public (not motor vehicle) fields, accidental deaths during 1945 maintained approximately the same level as for 1944, according to the National Safety Council.

STATE LEGISLATION INCIDENTAL TO INSURANCE AS COMMERCE

The year 1945 saw 44 of the 48 state legislatures meeting in regular session with the result that much legislation affecting casualty insurance and corporate suretyship was enacted.

Some of the most important state legislation resulted from the United States Supreme Court decision in 1944 holding that insurance is commerce, and the enactment by Congress of Public Law 15 which is discussed below under "Federal Legislation." Such legislation included the enactment in ten states—Alabama, Arizona (law subsequently repealed) Connecticut, Florida, Kansas, Maryland, North Carolina, South Carolina, Tennessee, Texas—of laws regulating the rates for certain kinds of casualty insurance and suretyship. In order to preserve the validity of their premium tax laws, in view of the fact that insurance is now commerce and insurance companies of other states are engaged in interstate commerce, 18 states—Alabama, Arizona, Arkansas, Connecticut, Florida, Iowa, Maine, New Hampshire, New Jersey, New Mexico, North Carolina, Oklahoma, Oregon, South Dakota, Tennessee, Texas, Washington, West Virginia—passed statutes equalizing the premium tax imposed upon domestic and foreign companies. For the same reason 13 states—Arizona, California, Colorado, Delaware, Georgia, Iowa, Maine, Maryland, New Jersey, North Carolina, Oregon, Tennessee, Texas—repealed the so-called retaliatory laws designed to impose upon companies of other states the same tax and other burdens which such other states impose upon companies of the state having the law. Another problem that arose out of this new status of insurance as interstate commerce, was the necessity of relieving directors and officers of insurance companies from liability because of payment of taxes under state tax laws, and bills for that purpose were passed in 18 states—Arizona, Arkansas, California, Connecticut, Indiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, New Jersey, New York, Nevada, Pennsylvania, Texas, Rhode Island, Vermont, Virginia.

OTHER STATE LEGISLATION

Other state legislation worthy of note included a substantial number of amendments to the workmen's compensation laws to provide for moderate increases in benefits under these laws. Also, several states extended their workmen's compensation laws to cover occupational diseases. The problem of payment of compensation under the workmen's compensation laws to partially disabled employees sustaining subsequent injuries was intensified by the return to industry of many disabled war veterans, and 14 states—Arizona, California, Colorado, Connecticut, Delaware, Iowa, Kansas, Maryland, Massachusetts, Oregon, Pennsylvania, Tennessee, Washington, Wyoming—adopted laws in 1945 setting up special Second Injury Funds to take care of such compensation.

The trend toward strengthening of the automobile financial responsibility laws continued and in five states—Maryland, Minnesota, Nebraska, Pennsylvania (effective July, 1947), Wisconsin—such laws were revised to bring them in line with the pattern of the New York Financial Responsibility Law. A new financial responsibility law was adopted in Georgia.

Fifty-three bills pertaining to accident and health insurance were introduced into the legislatures of 22 states in 1945. Of these, 34 became law.

FEDERAL LEGISLATION

On March 9, 1945, Public Law 15 was made effective by approval of the President. In this Act, Congress sought to clarify the status of insurance regulation following the decision of the United States Supreme Court on June 5, 1944 that insurance is commerce and, when crossing state lines, is interstate commerce, subject to dual control of the Federal and state governments.

While leaving employer-employee relationships in insurance and acts of boycott, coercion and intimidation subject to applicable Federal laws, Congress declared a moratorium until Jan. 1, 1948 with respect to other matters in the application to insurance of the Sherman Act, and also with respect to the Clayton Act, the Federal Trade Commission Act, and the Robinson-Patman Antidiscrimination Act, with the proviso that the first three of these acts should become applicable to the business of insurance on Jan. 1, 1948 "to the extent that such business is not regulated by State law."

A committee representing all branches of the insurance business has been working for several months to develop a program for state legislation to carry out the intent of Congress that the states take necessary legislative action prior to Jan. 1, 1948. It is hoped that, from the deliberations of the committee, a satisfactory program will emerge.

Other bills pending in the Seventy-ninth Congress, but not yet enacted, that should be noted are: bill to set up a Federal bonding fund and two bills authorizing the Secretary of the Treasury to secure a blanket bond covering all government officials and employees required to be bonded; several bills affecting aviation insurance; and bills to broaden the Social Security Law.

WORKMEN'S COMPENSATION INSURANCE

The ending of the war had much less effect on Workmen's Compensation experience than had been anticipated. Judging from the results during past periods of unemployment, it was thought that the termination of war contracts and the reconversion of plants would bring on an epidemic of claims from displaced workers and those who were temporarily unemployed. Unemployment insurance seems to have borne the brunt of claims, however, and to date there apparently has been no marked tendency to reopen Workmen's Compensation claims for old injuries, such as was the case during previous periods of unemployment. It now appears that the compensation premium volume will hold up remarkably well and that the experience will not suddenly become adverse. Jobs are again available in industry, and the wage level seems more likely to increase than to decrease. These factors should have a good effect on the experience and tend to offset any unfavorable influences which, if coupled with the present low Workmen's Compensation rates, would produce adverse loss ratios.

Because the experience of war projects in which the United States Government had a direct interest in insurance costs was kept separate for statistical purposes, such experience will not distort the rate structure for peacetime operations. Such war projects were written under special rating plans available only to the United States Government and its agencies. The segregation of the experience on these specialized projects was decided upon in advance in order to make certain that such experience would not influence either the rate level or classification relativity for regular peacetime operations. Otherwise, the Workmen's Compensation rate structure for normal operations might have been seriously distorted.

It seems quite possible that the special rating procedures developed during the war for activities in which the United States Government has an interest may lead to a demand for the development of somewhat similar procedures in connection with peacetime coverages. There is a general trend toward multiple-line underwriting and package policies, and the insurance buyers who have had experience with the Comprehensive Rating Plan and with the special policies for Army Post Exchanges, etc., may demand that progress be made in adapting such procedures to fit peacetime conditions for ordinary business enterprises.

The new countrywide Rating Program that was introduced two years ago was approved in 1945 by the Virginia State Corporation Commission and is now in effect in 28 jurisdictions. Under this Program, a guaranteed discount reflecting a gradation in the expense allowance is applied unless the assured elects in advance one of three optional retrospective rating plans reflecting the same expense gradation. It is anticipated that this Program will likewise be approved by several other states in recognition of the principle that reasonably uniform procedures in the handling of the business must be permitted by all states.

The Casualty Insurance Expense Exhibit, designed to obtain countrywide expense data by line of insurance, has been distributed by the National Association of Insurance Commissioners, and the companies will report their data for the calendar year 1945. Detailed instructions for complying with this call have also been distributed in order to assure uniform reporting by the large number of casualty companies.

Workmen's Compensation rates are revised annually in each state, the revised rate level being based on the two latest available years of experience. The trend of Workmen's Compensation rates continued downward in 1945 in reflection of the favorable conditions prevalent during the experience period used for ratemaking purposes.

MISCELLANEOUS LIABILITY INSURANCE

The wartime policy of keeping the number of changes at a minimum was continued during 1945. However, some rate changes and interpretations were promulgated in connection with the comprehensive liability policy of the Defense Plant Corporation (now the Reconstruction Finance Corporation) and the Smaller War Plants Corporation. The rates for building or plant construction work let on a lump-sum basis and for machinery and equipment were materially reduced. The classification, rates, and minimum premiums for lump sum construction work were interpreted as applying to the Reconstruction Finance Corporation for certain operations by independent contractors. These operations include plant clearance, preparation of warehouse sites, and construction or alteration of buildings for storage and disposal of surplus war property. The plant clearance operations involve removal of machinery and equipment from plants owned by lessees where lease agreements have been cancelled or where particular equipment is no longer necessary.

The classification, rates, and minimum premiums for buildings or plants operated by lessees were interpreted as applying to coverage for the Reconstruction Finance Corporation in connection with its operations as a designated agency of the United States Government for the disposal of surplus property. The operations consist of taking charge of numerous properties which it and other governmental agencies acquired or constructed during the war, for the period such properties are vacant.

Another change of interest was the adoption of a revised procedure for the rating of three- and four-family dwellings. These dwellings are now rated on a unit basis countrywide except in Texas and Greater New York. Previously they were rated on an area basis.

The definitions of receipts and sales in the Manufacturers' and Contractors', Owners', Landlords' and Tenants' and Product Liability manuals were modified to exclude for premium computation purposes taxes which the insured collects as a separate item and remits directly to a governmental division, provided accurate records of such taxes are maintained apart from other receipts. These revised definitions were made applicable to all policies expiring on or after Dec. 1, 1945.

The Manufacturers' and Contractors' Liability classifications for stevedoring and freight handlers were modified to include coverage for accidents, other than accidents on board vessels, which occur at the site of the operations and after the operations have been completed or abandoned.

AUTOMOBILE LIABILITY INSURANCE

The overshadowing event of 1945, as far as automobile liability insurance was concerned, was the lifting of gasoline rationing the day following the cessation of hostilities in the Pacific. This development, although not unexpected, made it necessary to revise completely the method of rating private passenger automobiles since the rates for such automobiles were keyed to the type of gasoline ration book held during the rationing period. After full consideration of all aspects of the problem, the casualty insurance companies reinstated the Private Passenger Automobile Classifications Plan which had proved so successful in the pre-war period in differentiating between risks according to the hazard. This Plan recognizes differences in hazard according to differences in the use of automobiles on the basis of whether the automobile is used for business purposes or not. Class A-1 is the preferred classification under the Plan and consists of those cars which are not customarily used for business purposes and, in addition, are not driven more than 7,500 miles a year and for which there are no operators under 25 years of age; Class A consists of cars which are not customarily used for business purposes but which are not eligible for Class A-1 rates; Class B consists of all cars customarily used for business purposes.

As was to be expected, there was a sharp increase in the use of private passenger automobiles immediately after the discontinuance of gasoline rationing. The resulting increase in mileage, when coupled with the poor mechanical condition of many automobiles and the increased speed at which automobiles were operated after the relaxation of the stringent regulations that were in force during the war, all pointed to a recurrence of the accident rate that existed prior to the war. The cost of settling claims, particularly those involving property damage, continued to mount during 1945, and it was not anticipated that this unfavorable trend would change in the foreseeable future. In view of these factors, all of which were unfavorable from a loss standpoint, the rates for private passenger automobiles were revised simultaneously with the reinstatement of the Private Passenger Automobile Classifications Plan to produce a rate level which was somewhat under that existing prior to the war for bodily injury and slightly over the pre-war level for property damage.

Studies of rates and rating plans for commercial automobiles and garages were undertaken during 1945 with the view to developing rating programs for these classes of risks which would more accurately reflect the conditions of the post-war period as they will affect these classes.

Work progressed on a revision of the standard provisions for the basic automobile liability policy undertaken for the purpose of expressing the coverage now given in briefer and simpler language and form.

ARMY POST EXCHANGES, NAVY SHIP'S SERVICE DEPARTMENTS, AND SIMILAR RISKS

During 1945, officers' messes and officers' clubs of various branches of the United States Armed Forces, as well as civilian messes, made extensive use of the simplified, multiple line policies and special rating basis established in 1944 primarily to meet the needs of Army Post Exchanges and Navy Ship's Service Departments in the United States. Because of their unique operation, an additional rating basis was developed for Welfare and Recreation Departments of all branches of the Armed Forces for use with the combination contracts.

BOILER AND MACHINERY INSURANCE

The adoption of uniform manuals and policy forms by the two groups of boiler and machinery carriers has worked out satisfactorily, and in 1945 the business settled down again to a more stable basis. Written premiums are appreciably less than in 1944 but as this condition was brought about by the rewriting of a considerable portion of the business in 1943 and 1944, the earned premiums will counterbalance this reduction to a great extent.

There were few changes in rates and policy forms during the year. Probably the most noteworthy change was the permissive elimination of the so-called "Priority Clause" from the Use and Occupancy and Outage Endorsements. With the cessation of hostilities and the subsequent reconversion of plants manufacturing boiler and machinery equipment, it was felt that this restriction, which was largely a wartime measure, could properly be eliminated.

Mention might also be made at this time of the part taken by the insurance companies in assisting the Government during wartime in keeping war plants at their highest efficiency. Engineering and accident prevention inspections were made, without cost to the Government, throughout the wartime period, and so helpful were they that both the Army Service Forces and the Secretary of the Navy publicly expressed their appreciation of the work done by the National Bureau for Industrial Protection, through which these inspections, reports, and recommendations had been cleared.

BURGLARY, THEFT AND ROBBERY INSURANCE

There were no outstanding innovations in the burglary insurance business during 1945. The available coverages satisfactorily met the needs of the insuring public. A major point of interest is the rapidly increasing loss ratio of the residence and outside theft policy, the coverage of which was considerably broadened in 1943, making it saleable in territories where it was never sold before. Apparently the present rate scale is not sufficient to carry the policy and increased rates are necessary.

The money and securities broad form policy, providing all risk coverage on money and securities for commercial firms, supplied a wartime need and developed into one of the most popular policies ever placed on the market.

Wartime conditions, involving scarcities of materials and finished articles, educated the public to the need of burglary insurance, as no amount of advertising or publicity would have done. Now the crime wave sweeping the nation, and in fact the world, continues to show the need for burglary insurance. The volume of premium increased steadily over each of the war years, and it looks as though the increase might continue.

ACCIDENT AND HEALTH INSURANCE

The remarkable growth of this branch of insurance, noticeable during the past few years, continued, particularly in the fields of group insurance and hospitalization. Public interest in accident and health insurance increased to a level not heretofore experienced. Medical insurance, still in its infancy, is developing rapidly, as is the wholesale or franchise method of underwriting. Estimates are that from 40,000,000 to 50,000,000 persons are now covered by some form of accident and health or hospitalization insurance. Insurers are displaying great interest in determining the types of coverages desired by the insuring public and in attempting to make the fulfillment of those desires possible through simply and properly designed policies.

Aviation coverage in accident policies was broadened during the year to cover passenger airline travel anywhere in the world and to cover passenger travel in private planes within the bounds of North America, all without cost to the insured. Coverage was further extended to include ground coverage for insured engaged in the aviation industry.

Other refinements in accident policies included removal of the 90-day election clause in the Dismemberment provision and removal of the 20-day limit for election in the Elective Indemnity provision, both revisions being distinctly to the benefit of the policyholder.

The extension of individual policies

to members of the Armed Forces within the continental United States was continued on the same basis as heretofore. The Victory Farm Volunteer Accident Policy, developed in 1943 in cooperation with the Bureau of Agricultural Economics of the United States Department of Agriculture for the protection of boys and girls enrolled as Victory Farm Volunteers of the United States Crop Corps, was continued in 1945, but will no longer serve any purpose with the cessation of hostilities. The Civilian War Injury Policy, developed because of the war, has been discontinued.

SURETY BONDS

It is anticipated that the premium volume for 1945 for surety lines will show a continued decline, owing mainly to the effect on contract bonding of the wartime restrictions on construction. The ending of the war in August came too suddenly to affect the picture for the year. Although many public works projects had been planned to start upon the war's end, labor difficulties and the continuance of wartime shortages of building materials and supplies, proved too great a handicap to rapid commencement of such programs. However, the fidelity premium volume will show a large but deceptive increase, mostly for the reason that most surety companies since the middle of 1945 have changed their underwriting practice to permit the writing of fidelity and blanket bonds on a three-year basis at two and one-half times the annual premium. Many assureds are availing themselves of this saving, and, as a result, the fidelity premium volume for the year will show an unusual increase.

In addition to the underwriting change just mentioned, with its consequent premium reduction, 1945 was also in other respects a banner year, not only for the number of substantial premium rate reductions effected, but also for the broadening of bond coverages by surety companies without any compensating increase in premium.

The end of the Second World War saw a return by the Army and Navy to their ordinary peacetime practices in the letting and bonding of con-

NET PREMIUMS WRITTEN

(By kind or type of insurance, by all U. S. casualty companies, including state funds, in the calendar years 1941–44).

Kind of Insurance	Net Premiums Written in Calendar Years			
	1941	1942	1943	1944
1. Workmen's Compensation	$445,361,768	$590,984,782	$650,417,182	$641,518,082
2. Automobile Bodily Injury	357,178,119	350,267,017	284,627,763	320,079,518

11. Boiler and Machinery	19,192,570	19,537,812	21,635,411	21,113,731
12. Credit	4,025,810	6,550,623	6,359,256	5,652,019
13. Live Stock	816,614	1,062,758	1,014,043	1,118,042
14. Sprinkler	728,384	845,599	912,355	1,018,511
15. Auto Fire, Theft, Tornado and other Miscellaneous Lines	18,736,665	17,374,792	28,391,930	32,570,363
Total	$1,408,905,529	$1,589,838,582	$1,602,673,354	$1,696,451,810
Number of Companies	410	408	434	444

tracts. During the war years, when military necessity alone and not price was the controlling factor, the Armed Forces in many instances deemed it expedient to waive normal bonding requirements. With the return of peace, the Army and Navy found it advisable to reinstate their time-tested and customary practices relative to competitive bidding and bonding of successful bidders. From time to time, as the military situation of the Allies became less acute, revisions of Army and Navy procurement regulations seemed to foreshadow that the Services would eventually restore their normal bonding procedures.

During 1945, the surety business continued its study of problems affecting the bonding of public and private construction in an endeavor to make its resources and experience available as a stabilizing force in the great building boom which apparently will result from civilian shortages in construction created by the emphasis on military needs during the war period. Particular stress has been placed on problems connected with bonding of construction to meet the needs of individuals and private enterprise generally.

DIVISION XI

AGRICULTURE AND ALLIED INDUSTRIES

CONDITIONS IN AGRICULTURE

By Arthur P. Chew
Office of Information, Department of Agriculture

CROP, LIVESTOCK, AND DAIRY PRODUCTION

Crop and livestock production in the United States in 1945 continued to reflect the momentum of the war effort. Directed toward goals adopted before planting time, it resulted in the largest production of food grains on record, the second largest production of feed grains, and the second or third largest total of livestock products. Thus the output was far above the pre-war level, though slightly smaller than that of 1944.

The November crop report indicated a harvest nearly equal to the record harvests of 1942 and 1944. Frosts reduced the corn crop below earlier hopes, but it exceeded 3,000,000,000 bushels for the fourth successive year. Wheat production again exceeded 1,000,000,000 bushels, cotton, however, was a small crop. Total meat production was only about 2,000,000,000 pounds less than 1944's record total of 24,500,000,000 pounds; it exceeded the pre-war (1935-39) average by 6,000,000,000 pounds.

Dairy production exceeded 1944's high mark. The flow of milk in the summer was an all-time record; in the later months it was nearer to the stepped-up output of the latter part of 1944. Egg production, 5 per cent lower in the first 10 months than in the corresponding period of 1944, was nevertheless 36 per cent above the average of the last 10 years.

The small extent to which the year's total farm production fell below the wartime peak was attributable partly to weather conditions and partly to the necessity for adjusting livestock to available feed supplies.

Necessarily, the Allied victory over Germany and Japan altered food requirements—downward for military and lend-lease shipments, upward for relief purposes and for U. S. civilians. In view of these changes, which necessitated very careful appraisal, the officially recommended crop production goals for 1946 make a total acreage somewhat below the previous year's goals, but larger than the acreage actually planted in 1945. Like those of the war years, the 1946 goals are highly selective. For example, reductions of 10 per cent or more are advised for peanuts, soybeans, early potatoes, and burley tobacco. On the other hand, the goals for sugar, rye, cotton, some types of tobacco, and a number of other crops exceed the 1944 planted acreages.

Export demand and relief feeding will depend largely on the outcome of the financial arrangements that are now being made, while civilian requirements will be influenced by the national income, but the Government expects a large total demand. It believes, however, that the recommended pattern of production will tend to avoid both shortages and surpluses. Approximately accurate adjustment of crops to indicated requirements is likely to be important throughout the reconversion period, because farm-production capacity is above the estimated long-time demand and likely to increase further.

WARTIME CROP INCREASES

With 10 per cent fewer workers on farms and with machinery and other facilities scarce, the farmers in each successive full war year set an all-time high in food output. Food production on United States farms in 1944 was 38 per cent above the pre-war (1935-39) average, while the total agricultural production was 36 per cent higher. This production was not just any kind, nor was it simply the uniform projection of pre-war kinds. It was much different from the pre-war pattern—made so to suit special war requirements. Moreover, the increase was from a high pre-war level, that fed nearly 132,000,000 Americans and also provided large exports. As mentioned, the production reported for 1945 is only a little below the wartime peak.

In the most urgently needed crops the wartime increases were tremendous; for example, in the oil crops, which had to be expanded to effect the loss of imports from the Far East. Acreage of soybeans harvested for beans during the years 1942 through 1944 averaged 340 per cent of the 1935-39 level. Flaxseed acreage jumped to 240 per cent above pre-war. Livestock contributed a huge increase to the war-food supply—hog production at the peak in 1943 was 77 per cent above pre-war. In 1944 cattle and calf slaughter was 37 per cent above pre-war. Dairy production from 1942 through 1944 was 15 per cent above the 1935-39 average. Production of chicken meat increased by more than 50 per cent over 1939, and egg production by more than 40 per cent.

Farm efficiency was the main cause of the increases. True, the weather was favorable, but not more than a quarter of the increase can be attributed to the above-average weather that prevailed. Expansion of crop acreage was not an important factor. The wartime peak of planted acreage in 1944 was only 2 per cent above the pre-war average. Also the farmers got along with a 10 per cent smaller working force; they had to cope with a considerable loss of strength and skill among their workers, since women, children, and elderly men were supplanting able-bodied men. Machinery and certain supplies were relatively scarce. Farm production increased largely because farm people worked longer and harder, got extra work out of their machinery, and made greater use than ever before of science and modern technology, which under war conditions had unlimited scope. With the demand virtually insatiable, the limit of production was the limit of capacity. In food crops there were no restrictions, except those imposed by shortages of labor and materials.

IMMEDIATE DEMAND PROSPECT

The immediate outlook includes the assurance of a continued high demand for farm products. Shifts toward peacetime levels for most crops need not begin at once. Total U. S. military requirements for food in 1946 will be far below those of 1945, which included the needs of prisoners of war, of certain Allied troops, and of many civilians connected with military operations. Military responsibility for emergency feeding of civilian populations will decline: in fact, part of this responsibility has been terminated already. Military food requirements for 1946, if our total military strength drops to 3,000,000 by the end of the year, may be only one-fifth as great as those of the high point in 1945, but the offsets are substantial.

Total U. S. civilian food consumption is likely to increase considerably in 1946, as a result partly of demobilization and partly of the removal of foods from rationing. With rationing ended, except sugar, very large increases in the civilian consumption of formerly rationed items will probably occur, particularly of meats, canned fruits and juices, canned vegetables, various types of whole-milk, evaporated milk, and cheese. Greater civilian consumption of some canned items may partly reduce the consumption of these products in the fresh form, but the net result should be an increase in food consumption.

Butter consumption in 1946 is likely to increase as fast as the production permits; cheese consumption will undoubtedly rise, likewise evaporated milk consumption. In general, the demand for dairy products will be strong, though some changes will occur in the utilization of milk, especially for butter. Altogether the civilian consumption of milk and dairy products may amount to the milk-equivalent of 117,000,000,000 pounds—about 6,000,000,000 pounds more than the record consumption of 1942. Civilian meat consumption will rise substantially; on a per capita basis in 1946 it may approach 150 pounds, as compared with 1945's estimated 125 pounds. Consumption of poultry may be about the same as in 1945, while the consumption of eggs may drop from about 380 to possibly 335 per capita. Wheat consumption for food will probably not change, while the consumption of rice and dry beans may increase. Consumption of potatoes may decline. Consumption of sugar and probably of fats and oils will reflect shortage of supplies.

Estimating the foreign demand is more difficult. Already, foreign requirements have changed greatly, owing to the termination of the war and the ensuing termination of lend-lease. Hereafter, minimum shipments to former lend-lease countries will depend on the proportion of their foreign exchange which they devote to the purchase of U. S. food. Maximum shipments will be determined by whatever credits may be arranged. Shipments to these countries will probably be at a lower rate than those made from the production of 1944. Shipments for foreign relief purposes, through UNRRA, will depend largely on future U. S. appropriations for this purpose, since outstanding allocations of U. S. funds for UNRRA have largely been utilized. An additional $550,000,000 had been authorized, and was appropriated in December. Also, UNRRA was seeking an additional $1,350,000,000 in U. S. appropriations, which was authorized on Dec. 17, 1945. Most economists believe, however, that, for at least a year or two, the total export movement will not be much below the wartime level.

EXPORT AND IMPORT CONTROLS

Controls will still apply to food exports and imports. These are functions of the Department of Agriculture, the export controls under an Executive Order of Sept. 27 which transferred them from FEA and the import controls by action of WPB taken last spring. Throughout the war years these controls have been administered in line with recommendations as to food allocations. Foods that are available in sufficient quantities may now be exported freely. On certain products which remain under allocation, but for which the foreign demand is small, the export controls have been removed. With wartime food scarcity largely ended in the United States, the outlook is for a comparatively rapid return to peacetime methods in food exporting.

Import controls will be continued also, to assure appropriate distribution of world-food supplies and to protect public procurement programs for fats, oils and oil bearing materials, cocoa beans, and other important foods. Control over private importations of such items is frequently indispensable in some instances, to prevent the possible diversion to the United States of shipments intended for other areas. This is particularly true of fats and oils, which will be relatively scarce here for some time. Nevertheless, the number of products subject to the import controls has been reduced in the last year from about 175 to about 125. As supply conditions improve throughout the world, the food import controls can be relaxed along with the food export controls in line with the movement to facilitate international trade in general.

FARM EXPORTS UNDER LEND-LEASE

In the war years about 90 per cent of the United States exports were under Lend-Lease. From the beginning of Lend-Lease in March 1941, through 1944, over 61 per cent of the lend-lease food shipments went to the United Kingdom; about 29 per cent to Russia; about 5.7 per cent to the North African-Middle Eastern-Mediterranean area; 3.2 per cent to the China-India area; less than 1 per cent to other countries. Meanwhile, under reverse Lend-Lease, Australia, New Zealand, and other countries supplied considerable quantities of food to the United States armed forces.

Most of the fresh and cured meats, eggs, cheese, and miscellaneous dairy products exported by the United States went to the United Kingdom to offset the loss of imports of these products from Denmark, the Netherlands, and Switzerland. Quantities of canned meat, fats, and sugar went to Russia to help offset loss of those products following German occupation of the Ukraine.

FARM PRICE POLICY

Agricultural price policy for the reconversion period has been established by legislation, some of it enacted before we entered the war. For example, Public Law 147 approved July 1, 1941, directed the Secretary of Agriculture, whenever he found it necessary, to encourage the production of certain crops to support the prices thereof and to give advance notice should a downward adjustment be necessary later. This and other agricultural price legislation has since been modified in detail but not in principle. Briefly, it now provides that, for two years following designation of the end of hostilities, the Government will support prices to producers for basic crops at 90 per cent of parity; that it will support prices at not less than 90 per cent of parity for non-basic crops or Steagall amendment commodities requested in increased amounts during the war; and that it will give price protection to other products on a comparable basis to the extent that funds are available and producers are able to bring supplies into line with demand.

Obligations in connection with this price-support legislation, as stated in the language of the enactments, do not rest exclusively in the Government. Farmers, too, have an obligation, which calls upon them to support and take part in any measures that prove necessary for post-war readjustment in farm production. How much readjustment will be required is highly uncertain. It depends largely on what happens in the non-agricultural parts of the economy, especially on the state of employment that prevails and on the level of the national income, but whatever happens, the Department of Agriculture states, it should be recognized that the Government's price support commitment involves a reciprocal obligation on the part of farmers to do what is necessary in adjusting production as nearly as possible to requirements.

FARM CAPACITY AND LONGTIME NEEDS

The Department of Agriculture recently cooperated with state agricultural agencies in an attempt to estimate what changes in the level and pattern of production, and in farm practices, would be best for farmers over a period of years from the twofold standpoint of current income and maintenance or improvement of the farm plant. The investigators suggested crop land at about the 1944 level. With improved practices, this acreage would result in a level of production considerably higher than that of 1944. Necessarily, it must be balanced with an increase on the market side. Food needs for relief are urgent. As relief needs taper off, food consumption in the United States can be increased, provided the purchasing power of consumers holds up. This increase in consumption will be largely in foods, such as, milk, meat, fruits, and vegetables, which require a large amount of farm resources per unit of production and utilize a relatively large part of the farm plant. Increased domestic consumption within the next five or six years could fill the gap between wartime production and wartime domestic consumption.

WORLD FOOD CONDITIONS

World supplies of nearly all major food products will be extremely short during the coming year. Production of wheat throughout the world in 1945-46 may be about 7 per cent below pre-war, but the exporting countries have large carryover stocks. Total world supplies will be about equal to the pre-war average. They will provide enough for minimum relief needs, however, only if the shortage countries continue their high extraction rates for flour milling, and if the world's diversion of wheat from food to feed uses does not run high. Liberated and deficit rice areas of Asia face a serious rice shortage. Sugar production in 1945-46 will be 13 per cent below pre-war but slightly larger than the crop of 1944-45. Total supplies will be smaller because operating stocks have been reduced. The fats and oils supply will be lower than in the previous year largely because of sharply reduced hog production in the United States, Canada, Argentina, and Europe. Liberation of the East Indies and of Manchuria promises some early relief of the world shortage of fats and oils. Some supplies should be available from these areas as soon as shipping can be spared.

Meat products on a world basis will be about the same as in 1944-45, and considerably short of pre-war levels. Moderately increased production of meats in New Zealand and Argentina is about offset by further slight declines in the United States, Canada, Europe, and Australia. Several countries in northeastern Europe are trying hard to increase their livestock production, subject to handicaps such as difficulty in importing feeds and an increased diversion of food grains and potatoes to food uses. Fish supplies remain much below the pre-war level, though recently the world-catch has been increasing and further increases are in prospect. World milk production in 1945 may be about 5 per cent below pre-war, owing to a sharp decline in Europe's production. Consumption of fluid milk and of dairy products other than butter will be above pre-war, while the quantity of milk converted into butter will be somewhat smaller. The demand for all dairy products is strong, because of the general shortage of other foods. Poultry numbers have declined heavily in Europe.

Ultimately, additional or substitute market outlets for U. S. products will be necessary, since the relief demand is by its nature transitory. These new outlets must be sought in expanded industrial uses for farm products and in large commercial exports. Expanded industrial utilization of farm products presupposes high industrial activity, just as increased domestic food consumption does, but it also depends on technological advances and on the development of pricing policies that will encourage new industrial uses. To find a market in industry, farm products must sell at prices that will make them the cheapest source among alternative raw materials.

Long-time export outlets for farm products, states the Department of Agriculture, will depend on the kind of a world we help to build. As the world's most powerful nation, we have a large responsibility for developing adequate world trade arrangements. Possibly we can exceed the pre-war volume of exports in some of our important farm products, if we are willing to accept payment in the form of commodities from other countries. Our non-farm exports will help farmers. Part of the domestic market for food products comes from exports of manufactured products, the making of which employs workers and distributes buying power.

WHEAT IN POST-WAR U. S. FARMING

Major problems will have to be solved in order to fit wheat into the post-war world. In the war years the demand for wheat as food, as feed for livestock, and as raw material for industrial alcohol was high. With the fighting ended, the demand may fall off, and we may have more wheat than can be moved at prices satisfactory to growers. Price support will continue into the post-war years, but whether other measures will eventually be necessary, such as acreage limitation, extensive subsidization of exports, some two-price plan, or some shift from supported to competitive prices accompanied by income or conversion payments, is matter for discussion.

Conditions in the next year or two may keep our wheat acreage at about what it is now. Our stocks of wheat, likewise those of other wheat-exporting countries, have been reduced considerably. In the 1945-46 marketing year, world trade in wheat may absorb most of the remaining surpluses in the wheat exporting countries. The price of wheat in the United States in 1945 was the highest since 1925; it was considerably above that of any other exporting country. Temporarily, we exported flour under subsidy, as authorized by Section 32 of Public Law 320, 74th Congress, as amended. Also, we exported some wheat grain under subsidy. Subsequently, military and relief requirements increased the overseas requirement. These commitments may maintain export wheat prices through another year at least. Eventually, however, the export-subsidy authorization may have to be applied increasingly, since maintenance of a large wheat acreage for several years will necessarily raise surplus-disposal problems.

As a broad objective, the idea of parity returns for wheat farmers has been accepted. Various approaches to this general goal are possible. One method for giving parity returns to farmers calls for price support at parity levels. Without acreage restrictions, this would result in surpluses. Another possible policy would offer parity prices with production control, and perhaps also with marketing quotas. Another plan would maintain wheat at parity or near-parity for food uses in the United States but would put wheat for feed and for export on a free market basis. This would be a two-price system. It would have a double purpose—to maximize returns to growers and promote full utilization of wheat resources. Farmers would get a blended price, which would be less than parity. How much less would depend partly on the ratio between the domestic food use and the non-food uses of the crop, and partly on the world price level. The plan would not involve crop control.

Still another possibility would be a return to free or world market prices, with a wheat conversion program to absorb the shock. Proposed features are: (1) an increase in the average size of operating units, promoted with credit and other facilities; (2) wider use of up-to-date machinery; (3) development of adequate conservation practices; (4) combination in certain areas of wheat production with range livestock operations; (5) government payments offered for the conversion of low-yielding wheatland to grasses; (6) production of wheat for use as a livestock feed, or alternatively the production of feed crops where they outyield wheat on a feed-unit basis; and (7) adoption of a crop insurance program with premium adjusted to individual farm risks. Ultimately such a program would put United States wheat-growing back in world competition, where its earnings would depend on its relative efficiency.

COTTON IN THE FARM ECONOMY

More than half our farm people live in the thirteen Southern States, and about half the South's 3,000,000 farm families get most of their cash income from cotton. These southern farm people, however, have among them less than one-third of the nation's crop land; pressure of population upon the land supply is greater in the South than in any other section. Moreover, they receive only about one-fourth of the nation's farm income.

The foreign aspect of the cotton problem demands attention. Heretofore in peacetime we have depended upon countries overseas to take half or more of our crop each year. When our customers abroad have taken less, our stocks have piled up. It has been obvious in consequence that we could not solve the problem at home unless we solved it abroad. The alternative —to cut back our production to fit our own consumption—was inacceptable.

This is where the United States

stood when war came to Europe in 1939. The war almost suspended our cotton export trade as such. We continued, however, to send some cotton abroad as lend-lease aid and greatly increased our own mill consumption to supply the United States armed forces. In this way we disposed of our wartime crops. Our surplus of cotton, though it remained large, did not materially increase, but now we again face the cotton export problem in a form more difficult than any hitherto known. Overseas customers who are able to pay for our cotton must be found.

This Government has been quick to assure the governments of other nations that it seeks no unfair advantage and wishes only to offset its handicaps in the international market. These have partly resulted, it should be noted, from measures the United States has taken internally to improve cotton prices, measures that have benefited foreign as well as American cotton growers. Hence, while insisting upon the right to retain its domestic and export programs, it has offered to negotiate an arrangement with other countries by which they may be protected from untoward or unintended consequences. The arrangement would provide for an equitable sharing of the international trade and for concerted action in dealing with the surplus. Preliminary discussions are under way.

Basically, the South wants a method whereby it may continue to sell cotton both at home and abroad, and at the same time to earn a satisfactory farm income. Between the wars it lacked such a method; it had to depend on price-supporting measures which involved an increasing loss of trade, especially in the export field. Permanent cotton policy must avoid this dilemma; it must support southern farm incomes by means that do not involve a loss of markets.

Necessarily, the policy must aim at many other objectives too, such as continued progress in farm technology, soil conservation and soil improvement, the provision of better marketing facilities, and advancement in rural health, rural housing, rural electrification, and rural education. It is particularly important to have maximum farm efficiency, which does not necessarily mean blind maximum production of every product in every area. It does mean relatively low-cost production, without which good prices may not ensure good incomes. Better seeds and stock, better machinery, more lime and fertilizer, and other aids to high production per acre and per man-hour do not conflict with the desire of farmers to obtain good prices for their products. On the contrary, technical farm efficiency makes price maintenance easier, because it accords with efficient total farm management, which includes the adjustment of crops to demand.

PARITY FOR PART OF THE COTTON CROP

One possible approach to the cotton problem would maintain a parity price only for the domestically consumed portion of the crop. For the export portion the growers would receive the world price. This would be arranged pro rata. For example, if two-thirds of the crop entered domestic consumption and one-third went abroad, each grower would receive parity for two-thirds of his individual production and the world price for the remainder. Practically, the farmer would receive a blended or average price, which would be lower than parity unless the world price equalled parity. Ordinarily, there would be no restrictions on the amount he could produce. Surpluses would not accumulate as long as the world market took all we offered at the world price.

POSSIBLE SHIFT TO WORLD COTTON MARKET BASIS

Another approach would hitch the domestic price of cotton to the world price. Under this condition the average price of cotton would be lower than what it would be were farmers assured of parity for the whole or even for part of their cotton production. As compensation it has been suggested they should have certain government payments to maintain their incomes, along with facilities for obtaining government loans, to cope with short-term fluctuations in the world price.

Still another proposed approach advocates extensive agricultural conversion in the cotton South. This procedure, too, would allow the domestic and the world price of cotton to be the same, and would use government payments to maintain the income level of the cotton farmers. In this case, however, the payments would extend only over a stated period. One of the purposes would be to help some cotton farmers change from cotton partly or wholly to other lines of production, while other cotton farmers improved their technique and lowered their costs of production sufficiently to be able to cope with world competition at world prices. Along with the conversion to a more diversified southern agriculture would go vigorous efforts to promote industrialization and wider markets in the region.

PROBLEM OF THE FEED GRAINS

The feed grain situation during 1945 was one of scarcity amid plenty. In other words, the supply of feed grains and other feeds was large as compared with pre-war years; but the demand for these products was large also. At the prevailing high prices, it exceeded the market supply, particularly of corn, throughout most of the year. Marketings of feed grains were larger than usual, but purchasers would have taken still larger quantities had the supply in commercial channels been greater.

The disappearance of feed grain, though heavy during the 1944-45 season, was not quite as heavy as in either of the two previous seasons. This was the result principally of reductions during the season in the number of hogs and chickens, but the rate of feeding per unit of livestock produced was higher than in the previous year and it produced record yields of livestock and poultry products. For example, the hogs slaughtered under Federal inspection during 1945 averaged about 260 pounds, the heaviest on record. Milk production per cow was at a record level and likewise egg production per layer on farms.

Meantime the utilization of feed grains for food and industrial uses was greater than in the preceding war years and greater than that in most earlier years. The total use of corn, oats, barley, and sorghum grains for seed, human feed, industry, and exports amounted to nearly 15,000,000 tons in the 1945 season, 2,000,000 tons more than in 1943-44, but despite the heavy feeding and the increased use of feed grains for food and industrial purposes the stocks of old crop grain on farms at the end of the 1944-45 crop year increased. With large production again this year, the domestic supply of feed grains for 1945-46 (not including wheat and rye for feed) will be larger than it was in 1944-45.

Post-war handling of feed grains poses problems sharply different from those presented by the great export crops. Agriculture produces feed grains, principally corn, feed-wheat, barley, oats, and grain sorghums, for its own use, either on the farms that grow these crops, or on farms and ranches whose operators purchase feed supplies. In other words, the market is domestic. Largely, this is also true of the beef cattle, dairy cattle, sheep, and poultry that consume the grains, and to a considerable extent it is also true of hogs. Hence in this connection, the difference between domestic and world prices is not vitally important: it does not suggest the use either of any two-price system, or of any program to make American feed grain prices fully competitive in world markets.

Another reason exists for shaping feed grain policy differently from that of other basic crops. Long-time conversion in the cotton and wheat areas seems to call for some shift out of cotton and wheat. Alternative enterprises would be largely feeds and livestock. Obviously, enhanced regional competition might result; this would not be serious in times of active business and high consumer-incomes, but would be bothersome in a depression. Conversion can not leave the feed and livestock industries where they may have to "hold the bag" unaided; it must develop protective features, such as will come into operation promptly and even automatically whenever supply conditions get out of hand. It is too early to specify details; but the Department of Agriculture believes we shall want a program to maintain high domestic consumption of livestock products, along with loan and storage facilities designed to stabilize feed grain supplies on the principle of the ever-normal granary.

SUGAR

In meeting sugar requirements, 1945 was the most difficult of the war years. Consumption under our sugar rationing program in 1944 was about 800,000 tons above the allocation for civilians. The Cuban drought, which began in the fall of 1944, continued until June 1945, and, with other factors, resulted in a 1945 Cuban crop approximately 1,500,000 tons less than the total production in 1944, including the equivalent of 900,000 tons of 1944 sugar diverted to the production of invert molasses. Then came the end of the European war and the ensuing increased relief and other demands.

The situation was both critical and widely misunderstood. Accordingly, a special House committee investigated it, and on May 21, 1945, issued a report which analyzed the main causes of the shortage and offered recommendations for dealing with it. Among immediate causes of the trouble, the report emphasized four factors: (1) Diversion of much 1944 Cuban sugar to the production of alcohol for the synthetic-rubber program; (2) drought in the Caribbean area which reduced the 1945 over-all production in that area by perhaps 1,250,000 to 1,500,000 tons below expectations; (3) European relief demands; (4) excessive distribution of sugar in the United States in 1944.

Principal recommendations of the committee, which have since been implemented in so far as they were not effective previously, were as follows: (a) Establish authority and responsibility for procurement, transportation, pricing, and distribution under one coordinating head; (b) open negotiations immediately for the purchase of the 1946 Cuban and Puerto Rican sugar crops; (c) tighten rationing controls; (d) reexamine allotments to different classes of industrial users; (e) review and adjust foreign commitments to safeguard minimum United States civilian use.

Liberation of the Philippines did not ease the situation. In fact, the sugar industry there proved to be in such a condition as to forbid the hope of material production until late 1947 or early 1948. Before Pearl Harbor the United States depended upon the Philippines for about 1,000,000 tons of sugar each year; consequently, the outlook was for continued sugar rationing in the United States in 1946, although on a somewhat more liberal basis.

In the next year or two the United Nations must find means to increase the sugar supply greatly and at the same time to prevent a recurrence later of great maladjustment between production and demand such as occurred in the 1930's, and led to great distress in sugar producing areas of the world with the enactment of restrictive legislation in this and other countries. Sugar is raw material for many industries. The industrial economies of the United States, the United Kingdom, and western Europe use it in tremendous quantities. The shortage aggravates their reconversion difficulties. Soft drink plants, bakeries, and candy factories can provide employment only if they can obtain sugar. They must have sugar, but the programs that get it for them must look ahead, and take precautions against going to the opposite extreme. This is vital to countries like Cuba and Puerto Rico, whose welfare depends more on the price of sugar than on anything else.

WOOL

The United States is on an import basis for wool, and changes in domestic prices normally follow changes in foreign prices quite closely, although domestic prices are maintained at a much higher level than foreign prices by the duty of 34 cents a pound clean content on most imports of apparel wool. At present, prices of domestic wool are being supported by the CCC purchase program at a level considerably higher than the duty-paid prices of comparable foreign wool. Consequently, mills are using domestic wool only where specified in military orders and are using imported wools for other orders. Although military orders have been large, domestic wool is accumulating in the hands of the CCC and is likely to accumulate at a more rapid rate as military orders drop. Unless prices of foreign wool advance, some means must be found for restoring more normal price relationships between domestic and imported wools in the domestic market.

Even with government support, prices received by United States farmers for wool since 1943 have been lower compared with pre-war (1935-39) prices, than prices received for domestic farm products in general. Sheep numbers have declined to the lowest level since 1928. This has not only resulted in a smaller wool production but production of lambs—which are needed in the nation's meat supply—has declined sharply. Without government support of wool prices, production of wool and of lambs probably would have declined much further.

TOBACCO

With the easing in shipping conditions to Europe, tobacco exports rose sharply during the year to a level near the biggest years before the war. Mainly this movement represented a change in the location of storage from the United States to the owning countries, of the substantial quantities of tobacco accumulated by foreign buyers during the war.

Since the United States is the largest existing source of the kinds and qualities of tobacco customarily desired by many importing countries, a continuing high level of tobacco exports from the United States is expected until low or exhausted stocks abroad have been replenished. When foreign stocks are replenished, however, high prices for tobacco may impede movement from this country into customary export channels. At the same time a continuation of wartime prices for U. S. tobacco would probably accelerate expansion of sources of supply outside the United States, including possibly the development of new sources.

Tobacco producers entered the post-war period with a greatly expanded market for their product. Much of the sharp increase in the domestic market during the war period likely will be maintained. The volume of exports will depend not only upon the price and availability of the leaf but also upon the many complicated factors in world policy on international trade. No segment of American agriculture has a greater stake in the free flow of goods among nations.

OPPORTUNITIES IN FARMING

Currently our farm production is about 25 per cent greater than it was in the late 1930's; it is about in line with the per capita food consumption to be expected with full employment and the equivalent of pre-war farm exports. In the next half century our population is likely to increase by at least one-fifth. As a result, we can expect a corresponding increase of one-fifth in market outlets for farm production. Changes will undoubtedly take place in farm exports and also in the industrial utilization of farm products, but these we can discount, because they will affect a relatively small proportion of the total. What will the indicated probable increase in the demand mean in terms of farm opportunities—in terms of opportunities to farm or to hold farm jobs?

Between 1880 and 1910 our total population increased 84 per cent; simultaneously, our farm production increased 82 per cent. Population and farm production rose in nearly the same proportions from 1910 to 1940. Between these years the population-increase was 43 per cent, while the farm production increase was 38 per cent. In each of these two periods, despite a slightly greater increase in population growth than in farm production, the level of food and fiber consumption per capita in the United States advanced somewhat. This was possible because farm exports gradually declined. The close relationship between population and farm production reflected the fact that food consumption, which accounts for more than 80 per cent of the total farm output, is very stable, but we can not infer how many farmers and farm workers we need simply from the demand for farm products.

Another important factor, namely, the efficiency of farming or the output per farm worker, must be considered. This has been advancing rapidly and it is still advancing. Thus farm production may keep in line with total population growth without providing more opportunities for farmers and farm workers. In fact, it may do so with an actual decrease in the number of such opportunities. The relationship between production and opportunities, unlike that between population and production, is by no means close. On the contrary, it is divergent. Thus from 1880 to 1910 the United States increased its farm production 82 per cent with an increase of only 35 per cent in the number of workers in agriculture. In the period 1910 to 1940 it achieved a 57 per cent increase in farm production with an actual decline in the number of farm opportunities. This decline was approximately one-fifth.

Both farm production and farm employment can expand if the population increases at a faster rate than that at which farm technology advances, but we are not in that position any longer. We are in the opposite position, in which technological advance, as reflected in farm worker productivity, is faster than population growth. This means that we can achieve an expanding farm production with no expansion and in fact even with a decrease in farm employment. The 21 per cent decline that occurred between 1910 and 1940 in farm employment had an offset, from the standpoint of production, in a 73 per cent increase in the productivity of the average farmworker. Since productivity per man engaged in agriculture is still increasing faster than total population growth, a continued slow decline in farm worker opportunities must be expected.

FARMS FOR VETERANS

Again the country faces the task of finding jobs for its war veterans. Today, as after other wars, many veterans are interested in going into farming. After the First World War there were some suitable new areas open for settlement although many new land farms were settled and land was plowed only to be abandoned later because cultivation of it did not pay. Today the outlook for farming opportunities is different. Since occupation of the best of the western land, opportunities for beginning farmers have been limited either to farms for sale or rent in established communities, to limited areas that can be brought into irrigation or cleared or drained for farming, or to less desirable land that was passed over or abandoned by earlier homeseekers, or to land more costly to develop and operate.

A survey made by the Army shows that about as many service men are thinking of farming as originally left the farms to enter the service. This survey and letters received by government agencies indicated that many of these veterans do not have enough money with which to buy and equip a good farm. Some of those interested in farming lack practical farm experience and some are physically handicapped.

In all, it is estimated that approximately 1,000,000 men in the armed services are likely to turn to full-time farming as a post-war job. Another half million are thinking of part-time farming to supply part of the family living while they engage in some other regular work. Of those interested in full-time farming, nearly two-thirds, or 600,000, say either that they have in mind farms to which to return, that they own farms, that they can return to family farms, or that they know farms they think they can rent or buy. About one-third, or 300,000, say they will have to look for farms. Only 100,000 appear interested in working on farms for wages. This indicates that the task of finding enough suitable farms for veterans wanting them will be a sizable job.

Current estimates of farm land sales, farm rentals, and farm vacancies created by retirement, by changes to other jobs, and by death, indicate that about one farm in seven will be available for a new operator in the first five years after the war—in other words, about 800,000 farm openings of all kinds and sizes. Only about one-half of these farms are adequate or can be made adequate by farm improvement, by adding more land, or by a combination of the two. Many of these farms are clearly too small, or have insufficient improved land and improvements, to provide an income sufficient for a family. Some are only suitable for part-time farms and rural residences for workers who earn incomes off the farm. Other farms not adapted to part-time farm and residential use need to be combined with adjoining farms to make more adequate units.

In addition to existing farm openings, possibly 40,000 to 50,000 new farms can be created to the full-time operating stage by irrigation and drainage in a similar period of time. If all suitable military land is declared surplus, possibly as many as 10,000 farms will be available. Of course, over a longer period several thousand additional new farms can be developed by various means if needed. Present authorizations and plans for irrigation, flood control, and drainage, if carried out, will make it possible to develop 75,000 to 100,000 new farms over a 10- to 15-year period. These developments will also provide supplemental water and protection to many existing farms.

FARM INCOME IN 1945

Cash receipts from farm marketings in 1945 may total about $20,400,000,000—3 per cent more than in 1944. The income from crops is expected to be 5 to 10 per cent above the previous year. On the other hand, the income from livestock and livestock products will reflect decreased sales, particularly in hogs.

In volume, the marketings (crops and livestock combined) will be about the same as the record total of 1944. It will include, however, an unusually large proportion of crops from the previous year's harvests. Comparatively heavy marketing of 1944 crops in 1945 resulted from several factors, notably the late maturity of 1944 cotton, the high moisture content of much 1944 corn, the shortage of rail transportation, and administrative orders that delayed tobacco marketings.

Total marketings of crops in 1945 were about 7 per cent greater than those of 1944, while marketings of livestock and livestock products were smaller by about the same percentage.

Prices received by farmers in 1945 may average about 2 per cent higher than in 1944. Livestock and livestock products will show a greater gain than crops.

Cash receipts from crops showed consistent monthly gains over 1944 up to and through September, especially in the receipts from feed grains; corn returned a higher income than in 1944; the receipts from oats rose sharply because of the large 1945 crop. Income from wheat increased owing to the sale of parts of two record crops at relatively high prices. Income from vegetables increased substantially; truck crop prices during June, July, and August showed greater gains over 1944 than any other group of prices.

Cash receipts from livestock and livestock products increased only slightly. Despite a small percentage gain in hog prices, income from hog marketings declined sharply, as a result of drastically reduced sales. On the other hand, income from cattle and calves was higher than in 1944 because marketings were about the same while prices were up slightly. Poultry and eggs returned an increased income, mainly as a result of higher prices. Dairy products earned slightly more income for farmers as a result of slightly larger production.

Net returns to farmers reflect production expenses as well as cash receipts. Total expenses of farm production for 1945 may be 4 per cent above those of 1944, with increases relatively large in labor costs and in maintenance and depreciation. Wages were up about 8 per cent, and the value of perquisites to hired workers was up slightly, in line with the higher value of farm products. The total costs of hired labor in agriculture, for wages and perquisites, seemed likely to be about 7 per cent higher than in 1944. Expenditures for purchased feed declined.

Charges for maintenance and depreciation increased partly because farmers had more opportunity to replace outworn and outmoded equipment. Expenses of maintenance and depreciation may be from 5 to 10 per cent above 1944. Farmers are eager to replace old equipment, and also to buy fertilizer and lime in increased quantities as supplies become available.

Taxes and mortgage interest showed little change from 1944. Local tax assessments have shown little change throughout the war period, while farm indebtedness has decreased.

Analysis of the receipts and the expenditures indicates the net income to operators in 1945 may be about 3 per cent higher than in 1944. Value of products consumed in farm homes may be slightly higher; the rental value of operators' dwellings may show a small increase, in line with some rise that has taken place in real estate values; government payments will be about the same as in 1944.

AGRICULTURE'S BALANCE SHEET

As measured by the dollar value of its physical goods, agriculture has increased from a $49,000,000,000 industry to a $74,000,0000,000 industry during the five years ended Jan. 1, 1945. During 1944 the increase was from $69,000,000,000 to $74,000,000,000. Financial assets such as currency, deposits, and war bonds increased from an estimated $5,000,000,000 on Jan. 1, 1940 to $13,000,000,000 on Jan. 1, 1944 and to nearly $17,000,000,000 on Jan. 1, 1945.

On the other hand liabilities have decreased throughout the five-year period. Farm-mortgage indebtedness, estimated at $5,271,000,000 on Jan. 1, 1945, was $364,000,000 less than a year earlier and $1,316,000,000 below the total on Jan. 1, 1940. The 1945 figure was less than one-half the all-time peak in 1923 and the lowest since 1916. Non-real-estate indebtedness (excluding non-recourse loans guaranteed by CCC) has also shown a slight decline.

With assets growing in value and liabilities shrinking, proprietors' equities obviously have benefited greatly. The proprietors held a 99 per cent interest in the physical and financial assets associated with agriculture on Jan. 1, 1945. This proprietary interest totaled $81,820,000,000 or $8,447,000,000 more than a year earlier and $38,036,000,000 more than five years earlier.

The wartime rise in prices has been the chief factor in the increase in assets. Real estate which accounted for 55 per cent of total assets on Jan. 1, 1945 increased in value from $33,642,000,000 in 1940 to $50,295,000,000 in 1945, an increase of about 50 per cent. Value of livestock and crop inventories has been influenced both by physical increases and higher prices. The index of prices received by farmers for farm products averaged 195 (1910-14=100) in 1944 or about 1.6 per cent higher than in the previous year.

The increase in value of physical assets during 1944 was largely the result of a further $4,700,000,000 rise in land values. A $394,000,000,000 increase in machinery and automobiles and a $250,000,000 increase in crops on hand were almost exactly offset by a $668,000,000 decrease in the value of livestock.

CROP INSURANCE

Federal crop insurance was not

available on the 1944 wheat and cotton crops or the 1945 winter wheat crop because the 1944 and 1945 agricultural appropriation acts provided funds only for liquidation of the insurance then outstanding. The Federal Crop Insurance Act was amended in late December 1944 to change certain of its provisions and to repeal the crop insurance provisions of the 1944 and 1945 Appropriation Acts. Thus crop insurance is again available to wheat and cotton producers. It is also available for the first time to flax producers. Offered generally on a nationwide basis on these three crops it had to be restricted to spring-planted crops in 1945, because fall crops had been planted before the legislation was amended.

The amendment to the Federal Crop Insurance Act authorized trial crop insurance on other commodities in a limited number of representative counties, but limited it in 1945 to corn and tobacco. Each year thereafter a trial crop insurance may be started on not more than three additional commodities. The purpose is to determine the most practical plans, terms, and conditions. Limited on each commodity to a period of three years and to 20 counties, the plan for trial insurance gives an opportunity to gain experience on a volume of business and a contingent liability kept at a low level.

On all the commodities covered, the insurance is against losses owing to unavoidable causes. On wheat, cotton, and flax the insurance is against loss of yield with coverage optional at either 75 per cent or 50 per cent of the long-time average yield for the farm. If the yield in the year of insurance is less than the coverage, the insured farmer is indemnified for the shortage. Under this plan, the amount of coverage, the premium, and the indemnity are determined in commodity units, such as bushels of wheat or pounds of cotton. Payment, however, both of premiums and of indemnities, is usually made in the cash equivalent at the current price.

FARM HOUSING

On farms in this country there are about 6,500,000 dwellings, and a recent analysis by the Department of Agriculture, in cooperation with the Bureau of the Census, has divided them into three main groups—dwellings that are acceptable, those that need extensive repairs or improvements, and those that are in such bad shape or are so small that they ought to be replaced. One-third are fairly satisfactory, one-third need major improvements, and the remaining third should not be used for human habitation. In short, some two-thirds of the nation's farm families are ill-housed. The situation reflects the adverse influence of the war, which hampers building and repair operations; nevertheless, it is not to any great extent a product of the wartime shortage of labor and materials. On the contrary, it is an old evil, with roots in the same causes that have impaired other aspects of farm life and given rise to calls for various farm programs.

Farm operators and their families occupy about 5,000,000 of the 6,500,000 total; hired farm workers, urban workers, and retired farmers occupy most of the remainder. Farm operators occupy the great majority of the acceptable dwellings. Nevertheless, many farm operators have very unsatisfactory housing, about half of them in structures that could be repaired and the rest in structures beyond repair. As for certain other occupants of farm dwellings, particularly the hired labor group, it must be said that, broadly, their housing is deplorable, though with scattered exceptions. Particularly bad in some sections are the tarpaper shacks and other wretched shelters of migrant workers. Most migrant farm workers live in dwellings far below urban standards, but the average even for settled farm families is not up to that of city dwellings.

The Department of Agriculture and the National Housing Agency agree that rural and urban people are entitled, equally on the basis of need, to help from the National Government in efforts to improve their housing standards. They agree, too, that the relationship between farm housing and other farm programs is extremely close. On two other important points the two organizations agree: (1) as much as possible of the required improvement in rural housing should be undertaken by private enterprise; (2) nevertheless, the Government has an ultimate responsibility for helping all families to achieve adequate housing. All types of possible programs, however, will require a large degree of local initiative and responsibility. Eventually, long-range housing projects must be able to stand on their own feet. Hence the use of subsidies, when necesssary, should be temporary and should be designed to remove the need for further subsidies.

RURAL HEALTH CONDITIONS

Alarming deficiencies in rural health resources are an increasing source of concern to all interested in rural welfare. The number of physicians available to serve the population on farms and in small towns is steadily decreasing. There are too few dentists, nurses, druggists, health officers, sanitarians, laboratory technicians. More than 1,200 rural counties lack approved hospital facilities. These deficiencies reflect the low medical purchasing power of rural areas. Associated with them, and with related economic factors, is a heavy burden of preventable illness, unnecessary disability, and premature death among under-served rural people.

Post-war planning, looking to fundamental improvements in rural health and sanitation, has progressed rapidly during the past year. The working Group on Health and Sanitation of the Department of Agriculture's Interbureau Committee on Post-War Programs is publishing a report on rural health problems and plans for improvement of medical services and facilities. This report sets forth five objectives to be achieved in the field of rural health, including easing payment of medical bills, constructing hospitals and other facilities, providing more medical personnel, expanding public health services, and elevating the quality of rural medical care and related services.

Planning and legislation concerned with one or all of these objectives are going forward in most of the states. There have been many conferences of state rural health committees on post-war problems, and several regional health conferences. Regional Post-War Planning Committees, representing the Department and the Land-Grant Colleges, have held conferences, devoted wholly or partly to rural health in Atlanta, Lincoln, Dallas, San Francisco, and Washington, D. C.

CROP MARKETING BY AIR

Aviation will influence agriculture in post-war years. Even in indirect ways the influence will be considerable; for example, air transport by sea and land will affect highways, railways, and sea ports. As the air-lines attract passengers, the older forms of transport will have to depend more on freight, perhaps with repercussions both on their charges and on their facilities. New areas may have to wait longer for railways. Ocean shipping will have to be adjusted to the new competition. The total effect on the economy, and therefore on agriculture, will undoubtedly be tremendous. In addition, aviation will affect agriculture directly through the opportunities it will offer for the speedy long-distance transport of perishables. In fact, here is agriculture's principal immediate interest in air transportation.

Air-freight transportation permits the long distance shipment of fully matured and ripened products, and makes them available to markets that otherwise could not be reached. Other forms of transportation, even over much shorter distances, often oblige growers to ship their products at various stages of unripeness and consequently of inferior quality. For example, perishables harvested in California, if shipped by air freight, could be retailed in eastern markets within 24 hours, as compared with the 10 days or more required in rail-freight movements. Probably surplus war-cargo planes will be available to move food when the war is over, though the available cargo will not be enough to utilize any large proportion of these planes.

COTTON AND GRAIN CROPS

By Paul L. Koenig

Chairman, Crop Reporting Board, Department of Agriculture

GENERAL—COTTON

The smallest quantity of cotton produced in any year of this century, with the exception of the 1921 crop, was harvested in 1945. This low ebb came from the smallest acreage planted since 1885. The small acreage reflects the reduction in the labor force, the strong competition for acreage from food, feed and higher yielding oil crops, and adverse planting conditions. The season was relatively unfavorable, resulting in heavier abandonment than usual. In spite of the unfavorable growing conditions, yields per acre were relatively high. This was largely because, in reducing acreage, growers utilized the better cotton land. Improved varieties and cultural practices also contributed to the yield increase. The crop was late, as wet and cloudy weather promoted excessive plant growth and tended to delay the opening of bolls, and the rate of ginning was far below average.

GENERAL—GRAINS

American agriculture again achieved outstanding production of grains and other field crops in 1945, despite the serious difficulties encountered at time of planting and again at harvest time. The national crop production in 1945 was the third largest of record.

Paralleling this huge total output, and contributing heavily to it, the eight food and feed grains aggregated 154,462,000 tons in 1945, closely crowding the 1944 total of 154,569,000 tons. This output was 99.6 per cent of the all-time record of 155,017,000 tons produced in 1942. Wheat, oats, and rice established new production records, while corn contributed a crop of 3,000,000,000 bushels.

Total production of the so-called food grains—wheat, rye, rice, and buckwheat—in 1945 was 1,226,358,000 bushels, compared with 1,175,004,000 bushels the previous year and the 10-year (1934-43) average of 889,981,000 bushels. National production of the feed grains—corn, oats, barley, and sorghum grain—totaled 4,925,633,000 bushels, 2 per cent more than the 1944 production and 28 per cent above the 10-year average.

Continued downward trends in acreage are accountable for a 1945 rye crop only 64 per cent of average and a barley crop 97 per cent of average. Sorghum grain production was 36 per cent above average but 47 per cent below the 1944 record crop. Buckwheat production was cut sharply by adverse weather conditions at harvest-time.

COTTON ACREAGE

The 18,157,000 acres of cotton in cultivation in the United States on July 1, 1945 was the smallest acreage planted to that crop since 1885. The 1945 acreage was 11 per cent below the 20,354,000 acres planted in 1944, 31 per cent below the 10-year (1934-43) average, and only 39 per cent as large as the peak of 45,968,000 acres planted in 1925. Planted acreage in 1945 was below that for 1944 in all cotton-producing states except New Mexico, Arizona, and California, in which states moderate increases were registered. In these three states practically all of the cotton is grown under irrigation.

The continued downward trend in cotton acreage is the natural result of reduced labor forces coupled with strong demands for maximum production of feed and food crops and of higher yielding oil crops. Furthermore, weather conditions in some of the important cotton-producing areas were unfavorable for cotton planting. Floods during the early spring of 1945 along the Mississippi River delta inundated large acreages of lands normally planted to cotton, and in many instances the waters did not recede early enough to permit growers to prepare seed beds and plant their crops. These floods and continued heavy rains resulted in a Delta acreage somewhat below that which would have been planted under more favorable weather conditions. Excessive drought at planting time also greatly reduced the acreage to be seeded in Oklahoma and in northwest Texas.

Abandonment of acreage at 2.6 per cent of the acreage in cultivation on July 1, left 17,688,000 acres for harvest. Percentage abandonment in 1945 was somewhat above the 10-year average of 1.8 per cent (excluding cotton plowed up for AAA compliance purposes) and, percentage-wise, was greater than in any year since 1936. Abandonment was particularly heavy in Oklahoma and in northcentral and northeast Texas, where continued rainfall throughout the growing season resulted in irregular stands and in unusually heavy losses from boll weevils. Above-average abandonment also occurred in the Mississippi River Delta states where the crop was planted under unfavorable conditions and where continued rains after July 1 drowned out some of the lowland acreages. In other states acreage abandonment was less than average.

Acreage planted to American Egyptian cotton in 1945 was further reduced to 6,200 acres compared with 14,700 acres planted in 1944 and almost 200,000 acres planted in 1942. Acreage planted to this long staple type of cotton was greatly increased during the recent war years to provide high quality fiber for military uses, but under conditions prevailing during the past two years American Egyptian cotton could not profitably compete with the long staples of imported fibers.

COTTON YIELDS

Although the 1945 per-acre yield of cotton, computed at 250 pounds, was 44 pounds less than the 1944 record, it was 19 pounds above the 10-year (1934-43) average. Even though much below the previous year, the 1945 yield was still the sixth highest on record and above that of any year prior to 1937. The attainment of this comparatively high yield, considering the generally unfavorable weather throughout most of the planting, growing, and harvesting season, is attributable in part to the improved varieties and cultural practices now used, but mostly to the use of the better cotton lands for growing the reduced acreage. In all states east of the Mississippi River and in Arkansas yields were well above average. These above-average yields more than offset below-average yields in all other cotton producing states.

COTTON PRODUCTION

The 1945 cotton crop of 9,195,000 bales (500 pounds gross weight) was 3,035,000 bales or 24.8 per cent less than 1944, 25.2 per cent less than the 10-year (1934-43) average, and below production in any year since 1921. This marked drop was owing to a 12 per cent decrease in acreage harvested and very unfavorable weather from planting through mid-harvest season in most states. Production was below 1944 as well as the 10-year average in all states, except in California where the 1945 production exceeded that of 1944.

Severe drought in Oklahoma and northwest Texas and excessive rain and flood water in the Mississippi Delta areas materially delayed plantings and caused the crop to get off to a poor start. In most all regions, stands were thinned by cold, wet soils, and considerable replanting was necessary. Frequent and prolonged rains which continued during the growing season resulted in excessive plant growth, heavy weevil infestation, and slow maturity of bolls. This condition was particularly serious in the Mississippi River Delta areas, in Oklahoma,

[1] Allowances made for interstate movement of seed cotton for ginning. A 500 lb. gross weight bale represents approximately 480 lb. net lint.

[2] Included in state and United States totals. Grown principally in Arizona, New Mexico, and Texas.

and in north central and northeast Texas.

With wet and cloudy weather continuing through mid-October, bolls opened slowly and the rate of ginning was far below average. Although open weather prevailed after mid-October and ginnings picked up rapidly, the limited labor supply was unable to harvest the crop before the onset of winter weather, so that a comparatively large portion of the crop remained in the field on Dec. 1.

VALUE OF COTTON PRODUCTION

The preliminary average price of lint cotton to Dec. 1 was 22.4 cents per pound compared with the season average price of 20.7 cents per pound for the crop of 1944. The price received for the 1945 crop is above the average received for any crop since 1924. Computed at 22.4 cents per pound, the value of cotton lint production is placed at $1,029,105,000. The preliminary price of cottonseed, at $51.80 per ton, is almost one dollar below the average of $52.70 per ton received from the crop of 1944. Value of cottonseed production is computed at $191,939,000 and the combined value of cotton lint and cottonseed, $1,221,044,000. The value of the 1944 crop was estimated at $1,526,020,000. Included is the value of cotton lint placed under government loan and unredeemed at the end of the crop marketing season. For the 1944 crop, 2,100,000 bales were placed under loan, of which about 1,000,000 bales had been redeemed by Aug. 1, 1945. Loans had been made on only 134,000 bales of the 1945 crop up to Dec. 8. In addition, the Commodity Credit Corporation purchased 95,000 bales of the 1945 crop through Dec. 8 as compared with 2,500,000 bales for the entire 1944 crop season.

WHEAT

Breaking the record set only the year before, wheat production in 1945

[1] Yield of dry beans is expressed as pounds per acre and production as thousand bags of 100 pounds each, uncleaned.

reached 1,123,143,000 bushels. Billion-bushel wheat crops had previously been harvested only in 1944 and 1915. Contributing to the setting of this new record were the third largest acreage ever harvested and a favorable growing season. The second largest winter wheat crop occurring in the same year and a fairly good spring wheat crop are combined in this record production of all wheat.

Ample supplies of wheat for domestic requirements in the 1945-46 season are indicated in the total of the new crop combined with carry-over stocks of 281,000,000 bushels. In the 1944-45 season, civilian and military food uses account for about 559,000,000 bushels, seed 81,000,000, industrial alcohol 96,000,000, feed 275,000,000, and exports 139,000,000 bushels. In the current season, July 1, 1945 to June 30, 1946, requirements are estimated at 540,000,000 bushels for civilian and military food, 82,000,000 for seed, 25,000,000 for industrial alcohol, 170,000,000 for feed, and 325,000,000 for exports, which would leave stocks about the same as at the beginning of the 1945 crop year, assuming that imports will be relatively small.

Farmers responded to the urge for increased food production by growing the largest acreage of wheat since 1938. Of the 68,781,000 acres seeded to wheat, 64,740,000 acres were harvested for grain; thus only 6 per cent of the seeded acreage was not harvested for grain. This compares with 65,439,000 acres seeded, 59,095,000 acres harvested, and about 10 per cent not harvested for grain in the 1944 season. Much winter wheat was seeded in the fall of 1944 in ground that was deficient in moisture, but rains in early October were in time to bring up good stands of wheat and to permit completion of seeding the intended acreage. Wheat went into the winter with good growth, having furnished more fall pasture than usual in the Great Plains states. Good snow cover in the eastern Corn Belt area helped to hold winter losses to a low level, and an early spring gave the crop a good start. However, wet weather at usual seeding dates tended to limit the acreage of spring wheat sown. Cool weather held rust damage to a minimum and favored filling of the heads. The enormous crop created a serious handling problem, but coordination of facilities for storage and transportation, even in the wartime shipping emergency, resulted in a satisfactory solution of the problem.

Valued at $1,673,688,000, the tremendous 1945 crop exceeds the $1,516,088,000 valuation of the 1944 crop and the $1,145,909,000 in 1943. Value is computed at the preliminary season average price of $1.49 per bushel in 1945, at $1.41 in 1944, and $1.36 in 1943. These season average prices are prices received by farmers for the portion of the wheat crop they sell, usually 75 to 85 per cent of the total produced. They include allowances for unredeemed loans at average loan values, though at the current level of prices the quantity of wheat placed under loan has become relatively small. Such prices applied to production afford a measure of the importance of each crop to the agricultural industry.

WINTER WHEAT

A total of 50,123,000 acres of winter wheat was seeded in the fall of 1944, nearly 9 per cent more than a year earlier and the largest acreage since the fall of 1937. Increases were rather general in important winter wheat states, though numerous states with relatively small acreages reduced them further. More than half of the total acreage was seeded in three states—Kansas, Oklahoma, and Texas—with 28 per cent of the total in Kansas alone. While Nebraska was fourth in acreage, it was second to Kansas in production, followed by Oklahoma, Ohio, and Washington.

Seeding operations began in the fall of 1944 with the ground so dry that seed beds were prepared with difficulty. While considerable acreage was seeded in dry soil, seeding operations were largely delayed until early October rains fell, permitting rapid seeding of remaining fields and enabling seeded acreage to germinate strongly. By Dec. 1, 1944, condition of wheat was reported outstandingly high in the Great Plains and Mountain states and unusually good throughout the Central and Eastern states, entering the winter with high yields and low abandonment in prospect. Spring growth started early with warm weather in March and early April. A shortage of soil moisture developed in the Pacific Northwest, in the Southern Great Plains and New Mexico, cutting yields, but excessive rains fell in North Central states and caused harvesting losses in areas east of the Allegheny Mountains. As a result, yields averaged 17.6 bushels per harvested acre, compared with 18.7 bushels in 1944, and the 10-year average of 15.3 bushels. On the 46,678,000 acres harvested, production was 823,177,000 bushels, exceeded only by the 825,315,000 bushels in 1931.

SPRING WHEAT

Of a total of 299,966,000 bushels of spring wheat, 35,020,000 bushels were durum and 264,946,000 bushels other spring wheat. Durum wheat was harvested from only 1,970,000 acres in 1945. Only in the severe drought years of 1934 and 1936 had the acreage ever before fallen below 2,000,000, but yields were exceptionally good, averaging 17.8 bushels, which was exceeded only in 1942, so that production was 10 per cent higher than in 1944. Other spring wheat had a fairly good season, but both the acreage at 16,092,000 acres and yield at 16.5 bushels per acre, were lower than in 1944. The greater part of the acreage developed without damage, though hot winds in some areas forcing heads to early maturity, drought in Montana, a relatively dry season in the Pacific Northwest, and frost in higher altitudes reduced yields. Harvesting weather was favorable in all areas.

RYE

Since the turn of the century, only in 1944 and in the drought years of 1933, 1934 and 1936, has rye production been less than the 26,354,000 bushels harvested in 1945. Continuing the downward trend of recent years, the acreage of rye seeded for all purposes was 4,476,000 acres, the lowest of record. Of this, only 44 per cent, or 1,981,000 acres, was harvested for grain, the smallest acreage since 1934. A considerable acreage is usually sown for pasture, for hay, and for soil conserving purposes.

Acreages harvested for grain continued to decrease in such major producing states as North Dakota, South Dakota, and Minnesota to the extent that they were exceeded in 1945 by the Nebraska acreage, which had been below them in the 1934-43 averages. Production in Nebraska exceeded average but was slightly below that in South Dakota in 1945. The national yield per harvested acre at 13.3 bushels was well above 1944, and average. At the preliminary season average price of $1.33 per bushel, the value of 1945 production was $35,145,000 compared with $1.09 and $27,677,000 in 1944.

Stocks of rye on July 1, 1945—12,787,000 bushels—were at an extremely low level. These, with the new crop and probable imports, provide a supply of only about 41,000,000 bushels for the 1945-46 season. In the preceding 1944-45 season, disappearance amounted to over 48,000,000 bushels, of which 9,100,000 bushels were used for food, 19,500,000 for feed, 6,200,000 for seed, 10,200,000 for alcohol and distilled spirits, and 3,200,000 for exports. In the current season, July 1, 1945 to June 30, 1946, about 8,300,000 bushels are expected to be used for food, 7,000,000 bushels for seed, with the quantity for feed, alcohol, and exports reduced to bushels between 20,000,000 and 22,000,000, which would exceed production and further reduce the July 1, 1946 carryover.

BUCKWHEAT

A relatively small crop of 6,701,000 bushels of buckwheat was harvested in 1945, about 6 per cent below the 1934-43 average acreage. The acreage seeded to buckwheat was well above average, largely because of substitution of buckwheat as a late catch crop when seedings of other grains were reduced by the wet spring. The crop progressed well during the growing season, but of the 486,000 acres seeded only 413,000 acres were harvested. Abandonment was particularly heavy in New York, Pennsylvania, and Michigan, where weather at harvest time was adverse. The yield of 16.2 bushels per harvested acre is below average. At the preliminary season average price of $1.12 per bushel, the value of 1945 production is $7,519,000, considerably less than the $9,290,000 for the 1944 crop, when the price per bushel was only $1.01.

RICE

For the fourth consecutive year, the rice crop set a new production record. The 1945 crop of 70,160,000 bushels exceeded that of 1944 by 2,000,000 bushels. It was harvested from a record acreage of 1,506,000 acres, 2 per cent larger than the year before. The average yield was 46.6 bushels per harvested acre, compared with 46.3 in 1944 and the average of 47.8 bushels. The Southern area produced 55,600,000 bushels in 1945, as both acreage and yield exceeded that of 1944 when 53,200,000 bushels were harvested. In Arkansas, despite delaying spring rains, development and expansion of a new area continued, and an excellent crop was harvested without unusual loss. In Louisiana and Texas the planting and growing season was favorable, but a tropical storm in much of the Texas rice area interfered with harvest operations and resulted in lower yield because of harvesting loss. The California crop of 14,520,000 bushels was slightly less than the 15,000,000 bushels produced in 1944; although the acreage was larger, yields fell below expectations. A rainy growing season caused rank plant growth and considerable lodging, resulting in much immature rice and some harvesting difficulties. At a preliminary season average price of $1.81 per bushel the 1945 crop is valued at $127,104,000, compared with $1.77 and $120,385,000 in 1944.

FEED GRAINS

The third largest aggregate of record for corn, oats, barley and sorghum grain was produced in 1945. The 118,290,000 tons in 1945 was exceeded only by the 119,936,000 tons in 1944 and 122,566,000 tons in 1942. It was a quarter larger than the 1934-43 average and a fifth larger than the pre-drought (also before A.A.A. allotments restricted acreage) average for 1923-32. As usual, the major part of this tonnage was of corn, but corn was a smaller proportion of the total than in any of the previous three years. Oats contributed considerably more than usual, barley was the smallest crop since 1938, and sorghum grain was the smallest since 1940.

Farmers realize the greater part of their income from feed grains by way of the livestock to which they are fed. Of the supply of feed grains, by far the greater proportion is fed on the farms where grown or purchased by other farmers for this purpose. Commercial users require only a relatively small proportion. In some areas corn was killed by frost while immature, so that more than the usual proportion was utilized as forage. Much of the grain corn was "soft" or of high moisture content, requiring a greater quantity to produce the desired results in livestock feeding. Feed production was fairly well distributed in 1945. The large production of feed grains assured generally adequate supplies, as production per grain consuming animal unit was well above average. Hay supplies were unusually large.

Information on stocks of corn, oats, and barley in all positions on quarterly dates have been available now for nearly three years. As of Oct. 1, 1945, stocks of corn were larger than in 1944, but less than in 1943; stocks of oats were larger than ever before, but stocks of barley were lower than in either of the previous years. Supplies of feed grains (stocks at the end of the crop year plus new production) were larger than in 1944, but prospective imports and quantities of wheat and rye to be fed were less.

CORN

Another 3,000,000,000-bushel corn crop was produced in 1945, the fourth in succession, but the smallest of the four. The 3,018,000,000 bushels in 1945 was 6 per cent below the record 1944 production, nearly equaled that of 1943, but was about a fourth larger than average. This total includes 2,699,000,000 bushels harvested for grain as well as an allowance for corn utilized as silage, forage, hogging, and grazing. More than the usual amount of the corn for grain was either "soft" or of high moisture content. Farmers, however, took measures to prevent waste by drying the corn where possible, or by feeding quickly and locally such corn as can not be stored safely.

The chief factor limiting corn production in 1945 was the relatively small acreage. Except for four years, 1939-1942, in no year of this century has a smaller acreage of corn been planted and harvested than the 92,867,000 acres planted and the 91,202,000 acres harvested in 1945. Planting intentions were never fully realized, though planting was not completed before mid-July. Abandonment was relatively light. About 64 per cent of the acreage was planted to hybrids—85 to 100 per cent in most Corn Belt states, which was a significant factor in the high average yield. Of the acreage harvested, 80,812,000 acres were for grain, 4,641,000 acres for silage producing 36,137,000 tons, and 5,749,000 acres were utilized by livestock in the form of fodder, pasture, and acreage hogged off.

Seldom has a corn crop with so many serious obstacles to overcome been able to reach bumper proportions. The acreage available for corn was limited when light abandonment of winter wheat left fewer acres to be replanted to corn, and seedings of spring grains were heavy. At corn planting time, intermittent rains and cold weather delayed operations beyond optimum planting dates, so that many fields intended for corn were never planted. A large part of the Corn Belt acreage was waterlogged and could not be worked for extended periods. Some late fields were not even tasseled by Sept. 1, making them vulnerable to killing frosts that occurred before or near the usual dates. The season was favorable, however, for corn in most of the South. An average yield of 33.1 bushels per harvested acre exceeded any year other than 1942. New production records were set in Indiana and North Carolina.

Measuring the value of all corn by the price received by farmers for the quantity they sold, the value of 1945 production, at the preliminary season average price of $1.14, was $3,436,356,000. This compares with $1.09 and $3,478,270,000 for the record 1944 corn crop.

Stocks of corn in all positions Oct. 1, 1945 were 329,000,000 bushels, which added to new production, result in a supply of 3,347,000,000 bushels for the 1945-46 season. A year earlier stocks were 235,000,000 bushels and the supply 3,438,000,000 bushels. On Oct. 1, 1943, stocks were 388,000,000 bushels and the supply 3,423,000,000 bushels.

OATS

The nation's first 1,500,000,000-bushel oats crop was produced in 1945. The 1,547,663,000 bushels was a third larger than the 1944 crop. It was harvested from 41,503,000 acres, on which the average yield per acre was 37.3 bushels, the best on record.

An exceptionally good season was experienced in most areas and especially in the North Central states where over 75 per cent of the acreage and 80 per cent of the production was grown in 1945. An unusually early spring enabled farmers to seed a large portion of the acreage early, and while later unfavorable weather delayed seedings, it did not materially reduce them. The growing season, prolonged by ample moisture and cool weather, was ideal for filling and maturing the crop, resulting in high test weight and heavy yields. New disease-resistant, higher yielding, and locally adapted varieties are being used throughout the country, and still others are being developed. The low labor requirements of the crop, the increased use of combines, and the favorable feeding quality of oats are other factors contributing to the steadily expanding acreage in most areas, especially in the South.

The 1945 oats crop has a value of $1,011,918,000 at the preliminary season average price for oats sold of 65.4 cents per bushel. This compares with $815,370,000 for the 1944 crop at 70.6 cents per bushel.

Stocks of oats in all positions on July 1, 1945 amounted to 238,000,000 bushels, which added to the new crop, makes the supply for the 1945-46 season about 1,786,000,000 bushels. A year earlier stocks were 208,000,000 bushels and the supply about 1,363,000,000 bushels, and on July 1, 1943 stocks were 262,000,000 and the supply 1,399,000,000 bushels.

BARLEY

The 1945 barley crop of 263,910,000 bushels was the smallest since 1938, about 5 per cent less than in 1944 and 3½ per cent less than average. Reduced acreage accounts for the small crop, as the yield of 25.9 bushels per harvested acre was the best since 1915.

The 10,195,000 acres harvested in 1945 was 1,900,000 bushels less than in 1944 and 1,800,000 acres of this reduction occurred in the North Central states. This region harvested nearly 70 per cent of the nation's barley acreage during the 10 years 1934-43, about 59 per cent of the total in 1944, but only 53 per cent in 1945. Only in Ohio, Montana, Colorado, Arizona, and California were 1945 acreages above those of 1944. Yields were higher than average in most states and higher than 1944 in most important producing states. Inability of barley to compete satisfactorily with other crops has brought a steady decline in barley acreage since 1942, the peak year. Low yields and poor returns, often resulting from disease, and lack of varieties that will hold their ground against other crops, have contributed to the decline in acreage. At the preliminary season average price of $1.02 per bushel, the 1945 barley crop is valued at $268,234,000, compared with $1.01 and $282,397,000 in 1944.

Stocks of barley in all positions on July 1, 1945 were about 97,000,000 bushels, which with the new crop, made the supply for the 1945-46 season about 361,000,000 bushels. A year earlier stocks were 76,000,000 and the supply 354,000,000 bushels, while on July 1, 1943 stocks were 121,000,000 bushels and the supply 445,000,000 bushels.

SORGHUM GRAIN

The 1945 crop of sorghum grain, at 95,599,000 bushels, appears small in comparison with the record crop of 181,542,000 bushels in 1944, but it is still a third larger than the 1934-43 average. The 6,324,000 acres harvested for grain were 31 per cent less than in 1944, but 29 per cent above average. The yield at 15.1 bushels per acre was 4.8 bushels less than in 1944, but 1.4 bushels above average.

Sorghums were planted later than usual, so that earlier than usual frosts killed a considerable acreage while still immature, reducing the acreage for grain below earlier expectations. The acreage for grain was only 44 per cent of all sorghums harvested in 1945, compared with 52 per cent in 1944. Sorghum grain production is heavily concentrated in the southern and central Great Plains states, with Texas producing 64 per cent of the 1945 national total. As sorghums are also produced for silage and forage, the greater-than-usual proportion which could not be utilized for grain in 1945 was largely converted to these uses.

Using the preliminary season average price for sorghum grain sold by farmers to evaluate the crop, the 1945 production at $1.19 per bushel has a value of $113,989,000, compared with 91.3 cents per bushel and $165,712,000 in 1944.

OTHER FIELD CROPS

Among the more important field crops in the United States is hay. Its importance among crops may be gauged by its value, which in 1945 ranked third, below corn and wheat, and which in 1944 ranked second, exceeded only by corn. Production of all hay in 1945 amounted to 104,951,000 tons, only slightly below the record crop in 1942. This was harvested from 74,216,000 acres. Hay is a universally grown crop with the various kinds suited to different portions of the country. Making up the total production were about 34,000,000 tons of alfalfa hay, 33,000,000 tons of clover-timothy hay, 4,000,000 tons of grain hay, 5,000,000 tons of annual legume hay, 8,000,000 tons each of lespedeza and other tame hay, and 13,000,000 tons of wild hay.

At the preliminary season average price of $15.10 per ton, the 1945 hay crop is valued at $1,589,919,000, compared with $16.30 and $1,598,720,000 in 1944. The 1945 supply of hay was 8 per cent above 1944 and 19 per cent above average, and well distributed over the country, as related to hay-consuming animal units.

DRY BEANS

The smallest crop of dry beans since 1936 was produced in 1945. The crop encountered adverse conditions from planting time through much of the harvest season, but despite all this, production was 13,578,000 bags. This was about 2,500,000 bags below the 1944 crop and the average. The 1,760,000 acres planted was the smallest acreage since 1938. Acreage losses were about 11 per cent, compared with 8 per cent in 1944. Yields per acre, however, were equal to or larger than in 1944 in most major producing states except California.

Stocks of dry beans on farms Dec. 1, 1945 were about 1,234,000 bags, compared with 1,623,000 a year earlier. On the same date 5,241,000 bags were stored in usual commercial bean storage places in and near producing areas, compared with 7,862,000 bags the year before.

SOYBEANS

Few crops underwent wartime expansion to a degree comparable with soybeans. The 1945 production of 191,722,000 bushels of soybeans was the second largest of record, exceeded only in 1943. It was almost 2¼ times as large as the 1934-43 average. Prior to the war, production of soybeans had jumped from less than 5,000,000 bushels in 1925 to over 105,000,000 bushels in 1941.

A larger proportion of the total acreage of soybeans planted for all purposes was harvested for beans in 1945 than in any previous year. Of the 14,205,000 acres planted, more than three-fourths, or 10,873,000 acres, were harvested for beans. The acreage for beans was largely concentrated in the North Central states. The average yield of 17.6 bushels per acre equalled the 10-year average, but was the lowest since 1940.

Wet weather in much of the soybean producing area caused late planting of a large part of the acreage and prevented planting of some intended acreage, though in some areas a considerable acreage was planted to soybeans when it became too late to plant spring grains and corn. The growing season was favorable and the crop made vigorous growth, so that only a small part of even the late-planted acreage suffered loss by frost.

The 1945 soybean crop, at the preliminary season average price of $2.08 per bushel received by farmers, was worth $399,011,000. In 1944 the value was $390,498,000 at $2.05 per bushel.

Stocks of soybeans on Oct. 1, 1945 were less than 8,000,000 bushels, which with the new crop, make up the 1945-46 season supply of nearly 200,000,000 bushels. A year earlier stocks were over 14,000,000 bushels and the supply about 205,000,000 bushels, of which 152,000,000 bushels were processed for oil. On Oct. 1, 1943, stocks were 12,500,000 bushels and the supply 206,000,000 bushels, of which 142,000,000 bushels were crushed for oil.

THE DAIRY INDUSTRY

By Gerson Levin
Bureau of Agricultural Economics, Department of Agriculture

GENERAL

While the years 1943 and 1944 were characterized chiefly by the adjustment of supply of dairy products to meet wartime needs, most of 1945, especially the first eight months, reflected the full impact of government programs. Under the impetus of record unit returns, including government incentive payments, and accompanied by excellent pasture conditions, milk production was at a record level. Production of the most desired manufactured dairy products for war purposes (cheddar cheese, canned and powdered milk) was at or near record levels. Rationing programs and government orders, when they were in effect, appeared to distribute the supply more equitably than in any year since 1942. However, the supply-demand gap for dairy products was very wide during the year, even after the cessation of hostilities.

MILK PRODUCTION RECORD

Except for the drought years, 1934-37, 1943, and 1944, milk production has been steadily increasing. Until 1940, this upward trend was about in line with increases in population. Since 1940, however, the increase in milk production has been greater than the population increase. Production on farms during 1945 was about 123,000,000,000 pounds, 3 per cent above 1944, and 19 per cent above pre-war (1935-39). The average number of milk cows on farms—25,700,000 head—was about 1 per cent below the 1944 record. However, a record milk production per cow of nearly 4,800 pounds—5 per cent above 1944 and 9 per cent above pre-war—was more than an offsetting factor. This high level of milk production per cow was a reflection of the high unit returns which permitted a liberal rate of grain and concentrate feeding. Also, pasture conditions, except for 1942, were the most favorable in more than a quarter of a century.

PRICES AND INCOME

Restrained by maximum price regulations, prices received by farmers for dairy products in 1945 were not much different from the previous year. The index of prices received for dairy products averaged for the year 197, one point below 1944. Wholesale and retail prices were unchanged from 1944 with the exception of creamery butter, which was raised 5 to 6 cents in early November.

With a record milk production, the cash income from dairy products, including government incentive payments, was the largest ever reported. Cash receipts from marketing of dairy products totaled about $3,100,000,000. In addition, there were dairy feed payments of about $500,000,000, so that cash income was about $3,600,000,000, more than double the pre-war years. In addition to the cash income received by dairy farmers, it is estimated that milk, cream, and butter consumed on farms had a value of close to $600,000,000. Thus, gross farm income from dairy products was in the neighborhood of $4,200,000,000. As has been the case every year since 1919, except 1943, dairy products were the single largest source of income for farmers.

LIFTING OF WARTIME RESTRICTIONS

Directing of milk to the most desired wartime uses was accomplished by limitation, reservation, allocation, and rationing orders. Reservation orders require the setting aside of a part of output or stocks for sale to government agencies. Limitation orders restrict production and sales of products. Allocation orders require users to apply for permission to use a specified quantity of products under allocation. Rationing is a routinary version of allocation, used where a large number of consumers is involved.

The end of hostilities and the reduction in military requirements was followed from August through November by termination of all restrictions on the production and consumption of dairy products.

Reservation orders in effect through August 1945 related to creamery butter, American cheddar cheese, and spray process non-fat dry milk solids for human consumption. The percentages required to be set aside varied in such a way that civilian supplies for most months were fairly constant.

Limitation orders, which were in effect during the first eight months of the year and which were lifted in August or September, limited sales of fluid milk and fluid cream with less than 19 per cent butterfat, prohibited the sale of cream containing more than 19 per cent butterfat, except for manufacturing purposes, restricted production of all types of cheeses other than cheddar, cottage, pot, and bakers, and restricted the sales of dried milk products and compounds. These limitation orders were in effect in order to channelize milks into the most desirable wartime uses.

Allocation orders in the dairy field related to lactose (milk sugar) and casein.

RATIONING PROGRAMS

Supplies of manufactured dairy products during most of 1945 appeared to be more equitably distributed than in the preceding two years. Rationing of butter and cheese became effective March 29, 1943, and of canned milk on June 6, 1943. Rationing restrictions on cheese and canned milk were eliminated during September, 1945 and on butter at the end of November.

The supply of butter was shortest of demand in the early part of 1945 and after rationing restrictions were lifted. Cheese supplies were short during all the year. With the removal of rationing restrictions, supplies became scarcer in relation to demand. Supplies of canned milk were fairly ample during the year.

UTILIZATION OF MILK

The 126,000,000,000 pounds of milk produced on farms and in cities and villages were utilized and finally consumed in a variety of ways. About 3,000,000,000 pounds were used in feeding calves on farms. Additional 12,000,000,000 pounds were consumed as fluid milk and cream by people living on farms. In addition, about 6,500,000,000 pounds went into farm products. Thus, almost 22,000,000,000 pounds, approximately 1/6 of the total production, did not enter into channels of trade. The urban population consumed the equivalent of about 46,000,000,000 pounds of fluid milk and cream. Total consumption of fluid milk and cream, farm and urban, was 5,000,000,000 pounds or approximately 45 per cent of the total production. Creamery butter utilized the smallest quantities of milk in a quarter of a century, about 29,000,000,000 pounds going into that use. On the other hand, utilization of milk in cheese and canned milk was at a record level, about 11,500,000,000 pounds going into cheese production and 9,000,000,000 pounds into producing canned milk. An additional 6,000,000,000 pounds went into the production of ice cream, including dry ice cream mix, and dried whole milk utilized about 2,000,000,000 pounds, leaving approximately 1,000,000,000 pounds for other uses.

Skim milk available for manufacturing purposes was at a record of about 13,500,000,000 pounds. Of this quantity nearly 8,000,000,000 pounds went into production of non-fat dry milk solids for human consumption. Quantity of skim milk wasted or fed to livestock was probably the lowest on record.

MANUFACTURED PRODUCTS OUTPUT

With total milk production in 1945 at a record and with the price relationships favoring production of dairy products other than butter, the output of whole milk manufactured products was substantially above 1944 and at or near record levels. Production of American cheddar cheese was 900,000,000 pounds, about 11 per cent above 1944 and almost double the 1935-39 average production. Production of condensed and evaporated milk was 4,230,000,000 pounds, 13 per cent above 1944 and 90 per cent above average. Dried whole milk production was 205,000,000 pounds, 10 times the pre-war average and 30,000,000 pounds above 1944. The output of non-fat dry milk solids for human consumption reached a record level of 640,000,000 pounds, 10 per cent above the previous record in 1944. In sharp contrast to the near-record-level production of whole milk products, total butter output in 1945 of 1,720,000,000 pounds was the lowest in a quarter of a century. Although current estimates of ice cream production were not available, production of ice cream and sherbets was probably higher than in any year of record.

CIVILIAN PER CAPITA CONSUMPTION

Of the total supply for human consumption of about 124,000,000,000 pounds, milk equivalent, of dairy products, approximately 103,000,000,000 pounds were consumed by civilians, 13,000,000,000 pounds were procured by the armed forces, 6,000,000,000 pounds were exported, and the remaining 2,000,000,000 pounds went into stocks. Purchase by the armed forces and the U. S. Department of Agriculture for lend-lease purposes accounted for about half of the total cheddar cheese production, 40 per cent of the evaporated milk output, a quarter of the creamery butter production, more than 2/3 of the dried whole milk manufactured, and about half of the production of non-fat dry milk solids for human consumption. In addition, about 2,000,000,000 pounds of fluid milk and cream were consumed by the armed forces.

Because of the high level of milk production and the sudden surrender of Japan in August, the 1945 civilian per capita supply of dairy products (on a milk equivalent basis) was about equal to the pre-war level and above 1943 and 1944 despite the large quantities of non-civilian purchases. Civilian consumption of dairy products was about 800 pounds per capita. Consumption of fluid milk and cream, though restricted by government orders until mid-August, was about 440 pounds per person, 4 per cent above 1944 and 30 per cent above prewar. Civilian supplies of most whole milk manufactured products (cheese, canned milk, dried whole milk) were at or near the pre-war level. Per capita consumption of butter, however, was the lowest in almost a century.

The milk equivalent of production and consumption of dairy products also can be determined by using conversion factors based on the relative amounts of non-fat milk solids (protein, minerals, and milk sugar) contained in the various products. Milk products containing non-fat milk solids are by far the most important nutritional sources of calcium and riboflavin. In view of the possible deficiencies of these two nutrients in civilian diets, this method of calculating milk equivalents is receiving increasing attention. Figured in this way, the civilian per capita consumption of all milk and dairy products on a whole milk equivalent basis in 1945 was 560 pounds, compared with 524 pounds in 1944 and a 1935-39 average of 431 pounds. The difference between the civilian consumption of all milk on a fat and non-fat solids basis largely represents non-fat solids (skim milk, buttermilk, and whey) fed to livestock or used for industrial casein.

GOVERNMENT PRICE SUPPORTS AND SUBSIDIES

For 1945, specific price supports on manufactured dairy products were not announced as in 1943 and 1944. The only support commitment which was in effect was that of the Steagall Amendment to the Price Stabilization Act, which provides that the price of whole milk and butterfat received by farmers shall be supported at not less than 90 per cent of parity for two years following the Jan. 1 after hostilities cease. However, subsidy payments were made on butter and American cheese in order to keep the cost of living down. The rollback subsidy of 5 cents per pound on butter was in effect through Oct. 31. The cost of the rollback butter subsidy for the year 1945 was slightly over $60,000,000.

The subsidy payments on American cheddar cheese were 3¾ to 4 cents per pound, depending upon the amount of moisture in the cheese. This subsidy payment was in effect during the whole year and aggregated approximately $33,000,000. In addition, purchase and resale programs for fluid milk, which had been in operation since 1943, continued in 13 major marketing areas.

A program of government payments to protect dairy farmers against increases above September 1942 feed prices, continued in operation during all of 1945. Payments were highest in areas where the quantity of purchased feed is large and feed costs the most advanced. The total cost of this program is estimated at about $500,000,000 for 1945.

INSECT PESTS AND PLANT QUARANTINES

BY P. N. ANNAND

CHIEF, BUREAU OF ENTOMOLOGY AND PLANT QUARANTINE,
DEPARTMENT OF AGRICULTURE

GENERAL

Research, conducted cooperatively by the Bureau of Entomology and Plant Quarantine with Federal, state, and other agencies, has produced results which promise far-reaching effects upon the general control of insect pests in the future, and which will also affect large-scale programs to combat outbreaks of injurious insects. Of special interest is the extension of the usefulness of the aerosol method of dispersing insecticides, both the liquefied-gas aerosol and those in the form of smokes. The utilization of various types of distributors, whereby a concentrated spray, broken into very fine droplets, can be effectively applied from the air, has made possible the practical use of airplanes for the application of sprays. As little as one gallon will give good coverage over an area as large as an acre on certain types of foliage. This opens up new possibilities for the application of liquid insecticide materials from the air. Similar improvements have been made in equipment for applications from the ground.

Extensive research on new insecticides has shown the important new material DDT to hold much promise against agricultural insects. Although not effective against all insects, the results indicate that it will be useful against many important ones which are injurious to livestock and crops. The more promising methods are being rapidly adapted to aid in efforts to control pests of major importance and to maintain the production of food, lumber, and fiber. Methods and formulations for its use for the control of disease-carrying insects have been developed and used effectively by the armed forces. Certain of its limitations must be worked out before DDT can be used with safety for some purposes.

NEW INSECTICIDES AND METHODS OF APPLICATION

Two new nicotine compounds were found to be more highly toxic than free nicotine. Solutions, emulsions, powders, and aerosols containing DDT were formulated and tested for various insecticidal purposes. Specifications were worked out for commercial grades of DDT and for certain DDT preparations. A new insecticidal material, the active principle of which is the gamma isomer of benzene hexachloride, was tested and found to be more toxic than DDT to some insects and less toxic to others. Further tests were made in the adaptation of heat-generated, or "smoke," aerosols for the control of agricultural pests. Tests of the latest models of power blowers in dispersing insecticides in finely atomized form proved that the mist blower is especially well adapted for treatment of shade and roadside trees and that much less spray material is used by this method. The so-called aerosol "bombs," of which approximately 35,000,000 were distributed to the armed forces during the war period, are now becoming available for civilian use.

INSECT REPELLENTS

Two important developments were the repellents dimethyl phthalate, which can be applied to the outer garments to give protection against chiggers and to some extent against ticks; and benzyl benzoate for impregnation of clothing to furnish protection against mites which transmit scrub typhus in the Pacific area. It was found that a combination of dimethyl phthalate, Indalone, and 2-ethylhexanediol was effective for use as a repellent against malaria mosquitoes found in the United States and was more generally effective on every individual against various mosquitoes and biting flies than any of these compounds alone.

MOSQUITOES

The research with DDT has shown it to be outstanding in its toxicity to mosquitoes. It is the only material known that will kill mosquitoes and flies when sprayed on the walls of dwellings or barns. An important accomplishment is proof of its residual value in controlling malaria. DDT has also given mosquito-control workers for the first time a material that can be applied from various kinds of aircraft and, with one operation, will destroy the larvae in the water and the adult mosquitoes on the wing.

SCREWWORMS

Two new smears that contain chlorophenoxathiin were developed for treatment of screwworm-infested animals. The new smears showed a distinct advantage over those containing diphenylamine in that they did not become hard and crusty on the wound after the benzene had evaporated.

CODLING MOTH

Used experimentally in 1944, DDT gave outstanding control of this insect in New York, Maryland, West Virginia, Indiana, and Washington. From ½ to one pound of powdered DDT appeared superior to three pounds of lead arsenate or cryolite for control of codling moth larvae, but the possible increase of mite populations where such quantities are used remains to be considered. Although residues of DDT on harvested fruit have been found difficult to remove, they do not appear sufficiently heavy to present a serious health problem.

ORIENTAL FRUIT MOTH

Injury to peaches was reduced considerably in experimental field plots sprayed with DDT at the rate of one pound per 100 gallons of water. Two applications, one each just before the appearance of both second- and third-brood larvae, were more effective than one application made just before the appearance of the second brood. Continuation of the cooperative Federal-state survey in several western states disclosed the presence of the fruit moth in 1944 for the first time in five counties in Colorado and in one county each in Utah, Idaho, and Arkansas. In 1945 Washington and Oregon were added to the range of known distribution. The new method of producing *Macrocentrus ancylivorus Roh,* an important parasite of the oriental fruit moth, from the potato tuber worm was further developed for use under eastern conditions.

JAPANESE BEETLE

There was a 59-per cent expansion in the 1944 trap-scouting program, in which military and commercial airports west of the Mississippi River were included. Beetles were captured for the first time in 36 localities. Experimentally, one to three applications of DDT (micronized with an equal quantity of pyrophyllite and with glue as a wetting agent) at the rate of one pound to 100 gallons of spray gave almost complete control of the adult beetle on peach, early apple, grape, blueberry, and a miscellaneous group of ornamental and shade trees and shrubs. In soil tests a dosage of 25 pounds of DDT per acre was found to be more effective against third-instar larvae than 1,000 pounds of lead arsenate and to be as effective after 75 weeks in the soil as when first applied. Results of the milky-disease distribution program for control of the larvae continue to be favorable. Revised Japanese Beetle quarantine regulations were issued.

WHITE-FRINGED BEETLE

During 1944 there was some extension of the area infested. The insect is now known to occur on a total of 140,000 acres in Alabama, Florida, Louisiana, Mississippi, and North Carolina. Insecticides were applied to 68,702 acres in order to reduce populations at places from which there was danger of spread and on crops the marketing of which presented a hazard. Quarantine regulations were revised to include newly infested areas.

EUROPEAN CORN BORER

During 1944 this insect was found for the first time in Kansas, Nebraska, and Tennessee, and in a considerable number of counties outside the territory previously known to be infested in 10 states. In tests with DDT, good control of the borer was provided by various spray and dust formulations.

CORN EARWORM

Heavy populations developed on late corn in some sections of the Corn Belt during 1944. Experimental injections of DDT in mineral oil into silk channels of the ears gave almost perfect control of the insect. The hazard of toxic residues in sweet corn ears has not been definitely determined.

GRASSHOPPERS

Infestation remained generally at a low level in 1944. There were some important shifts in economic populations. Substantial increases occurred in Montana, Wisconsin, and Wyoming, and slight increases in Arizona, Colorado, Oklahoma, Texas, Utah, and Washington. There were significant decreases in Kansas, North Dakota, and South Dakota.

CHINCH BUGS

Although surveys in the fall of 1944 revealed large numbers in hibernation, the serious damage in prospect for 1945 was largely prevented by continuous cool, wet weather during the spring and early summer. Tests showed dust mixtures of DDT to be very effective as barriers, but for application directly on the bugs infesting sweet corn, popcorn, and oats, good control required heavy dosages.

STORED-GRAIN INSECTS

Tests in a commercial flour mill showed that fumigation of machinery units every three weeks held the insect infestation at a sufficiently low level to insure the production of insect-free flour. Carbon tetrachloride and various mixtures of carbon tetrachloride with ethylene dibromide or trichloroethylene gave promising results as grain fumigants. Wrappings coated or impregnated with DDT, acrylamide, or a trichlorobutyramide were highly effective in preventing insect entrance into packages of cereals in experimental studies.

VEGETABLE INSECTS

Special emergency surveys of insects that attack vegetables and their control requirements were continued, in cooperation with state workers, industry, and other agencies. In South Carolina, dust mixtures containing 1 or 2.5 per cent of DDT were found to be superior to all other insecticides tested for the protection of cabbage from caterpillar damage. Encouraging results were obtained when DDT aerosol, with methyl chloride as the propellent agent, was used on large field plots of peas for pea aphid control. In the greenhouse, DDT in aerosol form, applied with special dispensers, was found to be very effective against several species of insects affecting vegetables grown under glass. The results of tests obtained thus far indicate that the use of aircraft for applying insecticides to some vegetable and tobacco crops has a promising future.

PINK BOLLWORM

Additional infestations discovered in Texas in 1944, together with new discoveries during the crop season of 1943, continued to increase the threat of spread of this insect throughout the entire Cotton Belt. Effective November 9, 1944, the domestic quarantine and regulations were revised to include recently found infestations in southern Texas.

OTHER COTTON INSECTS

Losses from boll weevil and other cotton insects in 1944 were the lowest in recent years; damage caused by the boll weevil was the least for any year since 1911. Unfavorable conditions for weevils and favorable conditions for cotton resulted in the highest yields per acre ever recorded in the United States. In experiments against insect pests of cotton it was found that DDT was not effective against the boll weevil or the cotton leafworm, and caused an increase of the cotton aphid and the common red spider. It was effective against the bollworm, the cotton flea hopper, and several stinkbugs attacking cotton.

FOREST INSECTS

The outbreak of the Engelmann spruce beetle in Colorado continued unabated, killing over 1,000,000,000 board-feet of Engelmann spruce in 1944. Extensive surveys showed the infestation to be increasing in area and severity. The discovery that the Engelmann spruce beetle hibernates beneath the bark at the base of the trees during the second winter, a habit unknown to closely related beetles, has an important bearing on control methods. The program of experiments with concentrated DDT sprays distributed from an airplane for the control of forest-insect pests has been greatly expanded, and improved spray formulas have been tested. Preliminary results of these tests are very encouraging. It has been demonstrated conclusively that DDT is the most effective and economical insecticide discovered for control of the gypsy moth, as little as ¼ pound of the material in one gallon of solvent per acre being effective in some tests. Large-scale tests to determine the possible detrimental effects to beneficial insects, fish, and wildlife when DDT is applied to large forested areas were undertaken in 1945, but the complete results are not yet available. Tests with various types of airplanes have demonstrated that the helicopter may prove very useful in treating woodland areas too large for economical treatment by ground equipment and too small for economical fixed-wing plane applications.

BEE CULTURE

Feeding pollen and soybean flour to unprotected colonies in winter resulted in better colony development early in the spring than did the generally accepted method of heavily packing colonies for winter without supplemental pollen feeding. In limited tests, bees fed clover pollen supplemented with soybean flour reared more brood than those fed unmixed rye grass, star-thistle, partridge-pea, and clover pollen alone.

FOREIGN PARASITE INTRODUCTION

Special emphasis was placed on the importation of parasites of the vegetable weevil and the cotton boll weevil from South America. A new project for the biological control of the Klamath weed was initiated in the fall of 1944. Large-scale shipments of two leaf-feeding beetles and a root borer that attack this weed were received from Australia. These are being tested on several economic crops, and field releases of one species have already been made in northern California.

INSECT IDENTIFICATION

Over 59,000 insect specimens were identified as a basis for the institution of proper control or quarantine action, or in connection with experimental work. In addition, approximately 6,000 samples of insects and mites involved in human-health problems were identified for the Army, Navy, and Public Health Service. Direct assistance or instruction in insect identification and classification was given many officers of these branches of the service.

DUTCH ELM DISEASE

Operations were modified to concentrate on determining where the disease occurs, on advising elm owners of its nature and recommending ways of combating it, and on testing methods of disease control in selected areas. There was some extension of the known limits of infection.

WHITE PINE BLISTER RUST

The control program was conducted on much the same basis as in 1944, and in general, accomplishments were about the same. Over 16,000,000 ribes bushes were removed from 969,372 acres of control area, of which 490,014 acres were initial eradication and 479,357 acres were rework.

BLACK STEM RUST

No general epidemic developed in 1944. There were severe local epidemics in some sections west of the Mississippi River. East of the Mississippi the amount of damage was negligible.

PLANT QUARANTINES

Developments in the war situation strongly affected plant-quarantine enforcement at maritime ports in 1945. Ship arrivals increased 30 per cent over those of 1944. The Army program for returning troops from Europe by airplane accelerated the rapid growth of air-borne commerce. Inspection of nearly 46,000 airplanes represented an increase of 112 per cent over the previous year. Plant-quarantine inspection was inaugurated in Alaska, a step necessitated by air traffic into the Territory. Nearly 65,000 freight cars were inspected upon crossing the Mexican border during the fiscal year 1945 and more than 9,000 were fumigated as a condition of entry; these figures represent a decrease in this activity over the previous year, owing in part to a reduction in traffic and in part to the employment of procedures for waiving fumigation when it can be done without additional risk of pest entry. In addition, 5,390 Pullman and passenger coaches and about 4,800,000 other vehicles and over 930,000 pieces of baggage were inspected, upon arrival from Mexico, in cooperation with United States Customs. The use of tight railway refrigerator cars for the bulk fumigation of plant material with methyl bromide was authorized during the year.

FISHERIES

By Ira N. Gabrielson

Director, Fish and Wildlife Service, Department of the Interior

VOLUME OF YIELD

The year 1945 was an average one in the United States fisheries in so far as the volume of the yield was concerned. Figures available at the end of the year indicated that total production amounted to about 4,400,000,000 pounds, which is equivalent to the normal pre-war average. This figure is a slight recession from the 4,500,000,000 pound yield achieved in 1944, but is substantially larger than catches during the balance of the war period.

While total production was normal, the various fisheries contributing to the total yield met with uneven success. Some broke all previous records; others fell to the lowest level in years.

FRESH FISH INDUSTRIES

The New England offshore fisheries, which supply the bulk of the product destined for the country's fresh fish markets, brought in the heaviest landings in their history—567,000,000 pounds. These fisheries operated under severe handicaps early in the war, many of their vessels having been requisitioned by the military services. By the summer of 1945, however, most of these boats had been replaced by new ones, and a good many of those requisitioned had been returned. As a result, the productive capacity of the New England fleet was considerably greater than in pre-war days.

For the third successive year, Gloucester ranked first among New England ports, with landings of 213,000,000 pounds. Boston received 188,000,000 pounds. Two Massachusetts ports which have only recently risen to prominence—New Bedford and Provincetown—both handled the largest quantities of fish in their history: 101,000,000 and 42,000,000 pounds, respectively.

Production of fresh fish in other sections also held up well in 1945. Seattle, the major port of the Pacific northwest, received 83,000,000 pounds of fishery products, a gain of about one-third over the previous year. Along the coast of the Gulf of Mexico, landings of fish showed substantial increases over 1944, although crabs, shrimps, and oysters made little or no gain.

CANNED FISH

In contrast to the fresh fish industries, most of the canned fish industries had a relatively disappointing year. The salmon fishery, which was one of the most important sources of aquatic food for war purposes, had the poorest season in a quarter of a century, with a pack of only 4,800,000 cases. This small pack had been anticipated, however, on the basis of biological data. The runs of salmon have their cycles, and 1945 happened to be a year in which poor runs could be expected.

The catch of pilchards or Pacific sardines was below that of 1944, although not disastrously so. The 1945 catch was about 416,000 tons, compared with a 1944 yield of 567,756 tons. A two-fold use is made of pilchards, some being canned, the rest processed into oil and meal. Because of the improved manpower situation in the canneries, it was possible to put up a larger pack in 1945 than in the previous year, despite the smaller catch.

The pack of Pacific mackerel was one of the smallest in years—about 636,000 cases—and the Maine sardine pack receded from the high level of

3,000,000 cases packed in 1944 to an estimated 2,600,000 in 1945.

On the other hand, the tuna fishery enjoyed an excellent season, with a pack of approximately 4,000,000 cases. The ending of the war resulted in the reopening to tuna boats of the so-called "area of vigilance" which included the important fishing grounds about the Galapagos islands.

FISH MEAL AND OIL

The fisheries for the Pacific pilchard, Alaska herring, and Atlantic coast menhaden are the principal sources of fish meal and oil. Both of these products are used in animal feeding to provide essential proteins and vitamins; the oil also has scores of important industrial uses. Demands for both oil and meal during the war period were far in excess of the supply. Although complete figures for these industries were not available at the end of 1945, it was apparent that production of both products would fall somewhat below the 1944 level, which was 213,147 tons of meal and 27,324,173 gallons of oil.

VITAMIN A OILS

United States production of vitamin A oils, which attained a high level in 1943, continued the recession begun in 1944. During 1945, production totaled 162.6 trillion units, compared with 73.8 trillion units in 1944. The only commercial source of vitamin A is the livers and other viscera of fish, with the various species of sharks providing more than half the total United States yield. The most valuable of the sharks, because of the great size of its liver and the high potency of its oil, is the soupfin shark, a Pacific coast species. Early in 1944, a decline in the catch of the soupfin became apparent. Production of livers of this species was sufficient to yield only 18.9 trillion units in 1945, compared with 25.9 trillion units in 1944. In addition to the sharks, other important sources of vitamin A oils are halibut, ling cod, sablefish, tuna, and cod.

SHELLFISHERIES

The shellfish industries in general continued to suffer from the manpower shortage, which made for a scarcity of workers in shucking and packing houses, and in some instances for a scarcity of fishermen.

In most areas the opening of the 1945-46 oyster season found supplies of marketable oysters short in relation to the demand. Lack of labor during the war period seriously affected production in some localities where oysters are intensively cultivated like an underwater crop. Production in such oyster-farming areas will suffer for several years as a result of insufficient help during the period when the young oysters should have been transplanted and protected from natural enemies.

On the other hand, the New England lobster fishery produced the largest catch for many years, rivaling the heavy catches of this industry during the 1880's, despite the fact that manpower was still scarce and that shortages of rope, lath, and other necessary materials continued to plague the industry. Although biological proof as yet is lacking, the indications are that the present trend of the lobster population is upward, reversing the decline which has been evident for many years.

EFFECTS OF WAR ON THE FISHERIES

At the conclusion of the war, the condition of the fisheries was generally sound. Our aquatic resources contributed in many essential ways to the needs of war, supplying protein foods, animal feeds, medicinal oils, and a great variety of products of value in the war industries. Demands for fishery products throughout the war period were phenomenally high. However, it was recognized by fishery authorities of the state and Federal governments that to permit excessive withdrawals from fishery stocks at the expense of the continued welfare, or indeed the very existence, of these populations would be shortsighted. Accordingly, all essential conservation measures were retained in force. This prudence now appears to have been well justified. According to available evidence, the major resources are in at least as good condition as they were at the beginning of the war.

POLLUTION

In some instances, however, the war has taken its toll. Especially is this true in inland waters, where pollution, already a grim menace to the fisheries, was greatly aggravated by the rapid growth of war industries and by abrupt increases of population in industrial centers and military camps. Even less than normal care was taken in the disposal of wastes. Streams that once supported fish populations of great value have been turned into dumping grounds for chemicals and for untreated, or at best inadequately treated, sewage, creating conditions where it is impossible for aquatic life to exist.

In the lower Chesapeake Bay, large acreages of highly productive oyster beds had to be withdrawn from use because of the polluted condition of the water. Shad are unable to spawn successfully in certain sections of the Delaware River because pollution has so reduced the oxygen content of the water that the young can not survive; as a result, the once great shad fisheries of this river can not be restored until the pollution is cleaned up.

Not only have the shad, oyster, and other food resources been affected; in all but the most isolated sections of the country recreational fisheries are suffering damage as a result of water pollution. Although means to render most wastes relatively harmless by appropriate treatment are known, their effective application is hampered by conflicting, overlapping, and obscure authority to deal with the problem.

RIVER DEVELOPMENT AND THE FISHERIES

The problem of fishery resources in relation to the development of river basins for power, irrigation, or navigation was brought into sharper focus during the year by the maturing of several such projects. It became more than ever apparent that it is necessary, in the initial stages of such projects, to consider the role of the fishery resources in the economy of the region, as well as their less tangible function as a source of recreation. The Federal Government made extensive inquiries into this matter during the year, with a view to laying before Congress the facts needed for the protection of aquatic life in conjunction with water developments.

DDT AND THE FISHERIES

The war-developed insecticide DDT has potentialities both for good and for ill in relation to the fisheries. The possibilities of its beneficial use to improve sanitation in fish processing establishments suggested themselves as soon as the chemical was released for civilian use. However, because so little was known about the possible dangers of using DDT in situations where it might come in contact with food, special studies were carried out by interested governmental agencies, including the Fish and Wildlife Service. Proper use of DDT in fishery establishments was found to reduce the fly population by as much as 95 per cent; this reduction was, moreover, effective over a long period of time. Certain precautions were found necessary to avoid bringing the spray into contact with fish, or with scraps or oyster shells to be used in animal feeding.

Use of DDT in shore areas and over water for the purpose of controlling mosquitoes and other insects was found to involve serious risk of destruction of fish, crabs, and oysters, for all aquatic life appears to be highly susceptible to the chemical.

EXPLORING FOR NEW MARINE RESOURCES

The most challenging opportunities for the development of untapped marine wealth are in Alaska, especially in the waters of Bering Sea. Experimental fishing done here by the Federal Government a few years ago revealed enormous resources of groundfish, especially flounders, pollock, ling cod, and cod. Because of the remoteness of these fishing grounds from centers of population, it is not feasible to develop these fisheries with existing facilities. The year 1945, however, saw the launching of several projects for the opening up of the fishery wealth of Bering Sea.

The most ambitious of these projects was the establishment of the Pacific Exploration Company, which, with certain financial assistance from the Federal Government, will operate a factory ship and a fleet of trawlers in Bering Sea in 1946. The trawlers will deliver their catches direct to the factory ship for filleting and freezing. All processing of the fish will, therefore, be done at the scene of fishing operations, so that the elements of time and distance separating the fishery from its potential markets can be disregarded.

If the venture proves successful, a new fishery resource, perhaps as productive as the famed Grand Bank, will be opened up for the American public. Moreover, the revolutionary change in the method of operation—the processing of fish at sea—will then undoubtedly be adopted by other American fishermen who find it necessary to go to distant waters for their catches.

FORESTRY

By Charles E. Randall
United States Forest Service

GENERAL

The close of the Second World War brought an end to the heavy demands of the armed forces on the forests of the United States. Most of the wartime controls on distribution and use of lumber and woodpulp products were promptly modified or cancelled. The reduction in military requirements, however, was offset by pent-up civilian demands. Stocks at the mills and in the hands of distributors were seriously reduced, and these would have to be replenished before lumber would again be available in adequate volume to meet civilian needs.

The war brought convincing proof that wood is an indispensable material. The War Production Board placed it on the "National production urgency list" early in 1945. The Army classed lumber almost on a par with ammunition as a combat material. Wartime shortages of many wood products were a severe handicap to the civilian economy.

The 1920-40 average of annual lumber consumption in the United States was slightly under 30,000,000,000 board feet. It is likely that annual demand will be above this figure for several years after the war. Wood requirements for pulp and paper also are expected to remain at high levels materially exceeding pre-war consumption rates.

TIMBER GROWTH ESTIMATES

Latest estimates of the rate of timber growth in American forests were made by the U. S. Forest Service in 1938. At that time the total annual growth was estimated at 11,300,000,000 cubic feet. Losses from fire, insects, diseases, etc., reduced this to a net usable increment of 9,200,000,000 cubic feet. Volume of logs and cordwood cut for all purposes was estimated at 11,400,000,000 cubic feet. Timber cut thus exceeded net usable increment by 2,200,000,000 cubic feet. In trees large enough to yield sawlogs, the net usable increment was 26,700,000,000 board feet; and the volume cut was 42,400,000,000 board feet, more than 50 per cent in excess of growth.

The Forest Service in 1945 began a reappraisal of the forest situation to bring these and other pertinent figures up to date. Meanwhile, there was little doubt that timber was still being drained from the forests faster than it was being replaced by new growth. Because of continued depletion of growing stocks, the annual net increment is not likely to have changed much since 1938, but the drain is now substantially larger. Annual lumber cut in the past few years has been some 30 per cent greater than it was in 1938.

WORLD FOREST SITUATION

A report on the world-wide forest situation was issued in 1945 by the Technical Committee on Forestry and Primary Forest Products of the United Nations Interim Commission on Food and Agriculture. This technical forestry committee was set up by the Interim Commission in March, 1944, with Dr. Henry S. Graves, dean emeritus of the Yale School of Forestry, as chairman. Membership of the 13-man group included officials and leaders in forestry and conservation in the United States, Great Britain, Canada, Soviet Union, France, Norway, Brazil, Czechoslovakia, and China.

Among the world's raw materials, the report said, wood ranks second only to food, but despite the fact that forests can be managed to provide ample wood supplies and vastly increased social benefits, only 15 per cent of the world's timberlands are being handled as a renewable and productive resource. The committee estimated that two-thirds of the world's forests receive neither care nor protection.

To help meet the problem of the destruction of forests by war and the enormous prospective need for wood after the war, the committee urged international action by the United Nations Food and Agriculture Organization in collection and unification of forestry statistics as the first step in balancing the world's forestry budget and planning its expansion. The same world agency, it stated, should undertake to aid member nations in the solution of forest problems, such as the development of techniques in the growing, harvesting, and use of wood products, and research into values of thousands of tree species still of unknown quality.

Most important of the specific problems suggested for solution by the Food and Agriculture Organization's member governments include: 1. Restoration of Europe's war-depleted forests. 2. Extension of sound management in countries whose reserves of old timber are in process of depletion. 3. Reforestation in southeastern Asia and the Middle East as an indispensable step in soil improvement, more efficient agriculture, and higher nutrition levels for almost 1,000,000,000 people. 4. Initiation of forestry measures in the largely unexploited wood-surplus countries in Latin America and Equatorial Africa. 5. Effective world-wide distribution of forest products. 6. World-wide correlation of the results of research in forest production and wood utilization. 7. Coordination of forest production and utilization with soil and water conservation as well as with other land uses and services, such as wildlife and grazing.

FOREST FIRES

Acreage burned over by forest fires in the United States in 1944 was held to a little more than half that of the previous year. A total of 16,549,312 acres was burned during 1944 as compared with 32,333,398 acres in 1943. A reduction in number of fires also was reported: 131,229 for 1944 as against 210,326 the year before.

The reduction in fire losses was regarded by the Federal and state forestry agencies as particularly encouraging because for years prior to 1944 the area burned over annually remained close to the 30,000.000-acre mark, and the number of fires per year has been consistently around 200,000. Fire control officers of the U. S. Forest Service attributed the big gain against fire losses to several factors, including increased public consciousness of the danger of fires and need for safety precautions; an intensive wartime fire prevention campaign by forestry agencies; improved fire fighting equipment and techniques; increased Federal and state funds for wartime protection; fewer campers and hunters in the woods owing to wartime restrictions. Weather conditions were not unusually favorable; from the fire-weather standpoint 1944 was an average year.

Of the total area burned in 1944, 85 per cent was in the 11 Southern States, owing largely to the fact that less than one-half of the southern forests are as yet under organized protection. For the United States as a whole, 513,572,000 acres are under some degree of systematic protection, while 129,928,000 acres still lack organized protection. Eighty-four per cent of the total acreage loss was in unprotected areas.

JAPANESE BALLOON MENACE

During the first half of 1945, preliminary reports indicated that fire losses continued below average. A special menace to western forests, however, was presented by the appearance of Japanese stratosphere balloons carrying incendiary bombs. Several hundred of these free-floating balloons were released in Japan in the early months of 1945 to be carried by prevailing westerly winds to the North American continent. The Forest Service and cooperating agencies intensified protection measures against this menace. Several companies of paratroopers were assigned by the Army to augment the Forest Service corps of "smoke jumpers" (parachuting fire-fighters). No serious fires resulted from the Japanese balloon barrage, but six persons were killed by a balloon bomb in southern Oregon.

DISASTROUS WESTERN FIRES

In the summer of 1945, numerous bad fires occurred in West Coast and Northern Rocky Mountain states. One of the worst fires in recent years broke out in Tillamook County, Oregon, in the same area ravaged by the disastrous Wilson River fire of 1933. The 1933 fire burned over 267,000 acres containing some 12,000,000,000 board feet of virgin timber. Much of the same area burned again in 1939. The 1945 fire which started in July was fought by several thousand men, including large numbers of Army and Navy personnel, but the fire was not finally brought under control until September rains checked its spread. Approximately 130,000 acres were burned over, completing the devastation of one of the finest timber-growing areas in the country.

COOPERATIVE FARM FORESTRY PROGRAM

There are approximately 140,000,000 acres of farm woodlands in the United States capable of growing commercial timber. Farm forests occupy about 18 per cent of all land in farms; in the South and Northeast, from 40 to 60 per cent. About one-third of the annual timber cut comes from farms. The importance of the farm output of forest products is increasing as virgin timber supplies dwindle. In general, however, farm woodlands are producing from one-third to one-half of what they could under improved forestry practices. Farm owners frequently dispose of their entire timber stand in a lump-sum sale, often at a fraction of its full value, and leaving their timberland unproductive for years to come.

To provide technical advice in the management of farm woodlands and marketing of woodland products, the U. S. Forest Service has initiated a special farm forestry program in cooperation with state forestry agencies. By June 30, 1945, 100 projects had been established, covering 403 counties. Forty additional farm forestry projects initiated by the Soil Conservation Service were transferred to the Forest Service in 1945.

In each project, the services of a technical forester are made available to woodland owners to work up management plans for their timber tracts, to assist in marking and measuring timber ready for harvest, to obtain competitive bids for the timber, and prepare a simple sale agreement which will protect the interests of both farmer and purchaser. This type of assistance is resulting in the farmer receiving more for the timber sold than he would have under the old lump-sum sale practice, and he is left with a stand of thrifty trees which will produce future crops. The Forest Service reports that the program is also becoming popular with mill operators since purchase of marked trees of known volume reduces the element of risk in their operation, and since the selection method of cutting furnishes the millman with larger, better quality logs, and gives him the opportunity for return cuts and assurance of continuity and stability of operation.

FOREST SERVICE ANNIVERSARY

The U. S. Forest Service reached its fortieth milestone in 1945. The Forest Service was established on Feb. 1, 1905, when the earlier Bureau of Forestry was reorganized and the forest reserves (later renamed national forests) that had been set aside from the unreserved public domain were placed under its jurisdiction. Governmental forest work actually began in the Department of Agriculture as early as 1876, with the appointment of a commissioner to study forest conditions in the United States. In 1881 a Division of Forestry was set up, and in 1901 this became the Bureau of Forestry. Through these earlier periods, however, the Government's forestry work amounted to little more than compiling information and offering advice.

During its 40 years of existence, the Forest Service has spearheaded the conservation movement in the United States. The National Forests under its jurisdiction have become the world's outstanding public forest system. In 1905 the science of forestry was almost unknown in America; Forest Service research has developed a broad foundation of technical forestry knowledge applicable to American conditions. Where the practice of forestry has been adopted by timberland owners, it is usually the result, directly or indirectly, of pioneering work of the Government's foresters.

A fortieth anniversary statement by Lyle F. Watts, Chief of the Forest Service, stated however that the biggest jobs in forest conservation still lie ahead. The downward trend of the forest resource has yet to be reversed. The bulk of the nation's forest lands are still handled with little regard for future productivity. Large areas of depleted land need to be restored to usefulness.

MINERAL INDUSTRIES

GOLD AND SILVER

By Walter Renton Ingalls
Consulting Engineer, New York

WORLD PRODUCTION OF GOLD

According to American Bureau of Metal Statistics the world's production of gold in 1944 was 27,100,000 oz. against 29,540,000 oz. in 1943 and an all-time maximum of 40,925,000 oz. in 1940. These totals comprise conjectures in each year of 4,000,000 oz. for the production of Russia (including Siberia) and 1,000,000 oz. per annum for Japan, Korea, and Manchuria, no data having been received from any of those countries since several years prior to the war.

The decline in production in recent years has been owing to the withdrawals of labor and materials from gold mining in the United States, Canada, Australia, and elsewhere during the war. The Witwatersrand of South Africa, which produced about one-third of the world's production in 1940, was also affected in this way but much less severely.

The same condition continued during the first half of 1945 during which production in the United States was only 419,000 oz. against 505,000 oz. in the corresponding period of 1944. Similarly the production of Canada in the first semesters was 1,329,000 oz. in 1945 against 1,524,000 oz. in 1944. On the other hand the production from the Witwatersrand in 1945 has been steady at about 1,000,000 oz. per month, which was about the average rate of 1944.

GOLD PRICE AND MINING FACTORS

The British Treasury buys gold from almost all producing countries in the sterling area, except India where gold is sold in a free market. At the beginning of the war the Treasury undertook to buy all gold offered at 168 s. per oz., which price was based on what could be realized in the United States less cost of shipment, insurance, etc. Following reduction of such costs the British Treasury raised its price to 172 s. 3 d. per oz., effective June 9, 1945. This was of special benefit to the South African industry where the "dying" mines and the producers from very low-grade ore were having a hard time.

Five important mines of the Witwatersrand are in the "dying," *i.e.* nearly exhausted stage, and it is expected that the subtraction of their production will not be offset for some time to come by production from the modern deep-level mines, the development of which is naturally slow. These mines described as "deep" and "ultra-deep" are opened to a depth of 8,600 feet below the surface. (The Ooregum mine in the Kolar gold field in India had attained a depth of 8,800 ft. as far back as 1943.)

Following the victory over Germany and the consequent easing of munition requirements, resumption of gold mining in the United States was permitted by the War Production Board, effective July 1, 1945, revoking the prohibitory order of Oct. 8, 1942. About a fortnight before all restrictions of gold mining in Canada were lifted. This was too late in the year to lead to resumption of dredging in Alaska and the Yukon, the season being then too far gone to permit proper preparation of the ground, and also there was insufficiency of labor

GOLD HOARDS IN GERMANY

There was in 1945 much interest in the seizures of gold in Germany and Japan. In a salt mine in Germany a hoard of 100 tons of gold in bullion and coin was found. According to a military report early in June, experts were not then satisfied that all of the gold of Germany had been discovered. In the meanwhile all gold discovered in Germany was frozen until the claims of several governments could be proved, and herein were manifest tangles. For example: The Banque Nationale de Belgique gave the Banque de France a large quantity of gold for custody just before Germany invaded Belgium. Some of this was sent to America, some was sent to Takaradi, in West Africa, and the remainder was kept in France. When the Germans occupied France they took large quantities of gold back to Germany. Belgium alleges this was its gold. The Banque de France is reported to have reimbursed Belgium for it. The American and British claims to the gold found in their areas in Germany may come to be considered as legitimate booty of war.

According to a study of gold reserves published in the *Federal Reserve Bulletin* for November, 1944, the German gold reserve had shrunk from $650,000,000 at the end of 1928 to $90,000,000 at the end of 1933. In the worldwide depression of that period Germany was forced completely off the gold standard, most of its gold having then been exhausted. By the end of 1940 Germany had lost about all that remained. Accepting this survey, all of the gold existing in Germany in 1945 must have been obtained from elsewhere. According to the same authority the possession of gold by adjacent countries was as follows, in thousands of ounces:

	At end of 1928	At end of 1933	At end of 1940
France	60,716	146,105	57,257
Netherlands	8,466	17,900	17,600
Belgium	6,047	18,868	21,286
Italy	12,820	17,900	3,171

In reporting these data in ounces troy there is no confusion in respect of the value, which was changed from $20.67 to $35 by the Gold Reserve Act of the United States, Jan. 31, 1934. A ton of 2,000 lb. avoirdupois comprises 29,166 troy ounces and at $35 per ounce is therefore a little more than $1,000,000 (exactly $1,020,800).

GERMAN LOOTING OF GOLD

The above data indicate that France and Italy had been losing gold prior to the German occupation. There is no doubt that since 1940 the Germans took gold from Austria, Czechoslovakia, France, Hungary, Italy, and Poland, but much of the gold obtained from these sources passed to neutral countries in settlement of debit balances. It is known that Germany used looted gold to settle international debts and help finance the war. Thus we see from the estimates of the Federal Reserve System that the gold reserves of Switzerland, Sweden, and Turkey were all substantially larger at the middle of 1944 than they were at the end of 1940. It may be, therefore, that at the time of the conquest the gold remaining in Germany was not much more than what was captured in the salt mine. This subject can not be pursued any further with any assurance of accuracy. In none of the countries of Europe is there any gold production that merits statistical attention apart from a little in Sweden and Rumania. The Russian production is mainly Asiatic.

SEIZURE OF GOLD AND SILVER IN JAPAN

It was reported in press dispatches from Japan, Oct. 10, 1945, that General MacArthur had seized 58,000,000 oz. of gold bullion, silver bullion, and gold coin valued at $253,000,000, plus 33,422 oz. of platinum and 27,122,417 yen in silver coin. On the basis of the current exchange rate 15 yen equals $1. Some of this bullion was supposed to be loot from China, and elsewhere. No official data in respect of this subject have yet appeared.

SILVER PRODUCTION

No complete estimate of the world's production of silver has been possible since 1940, in which year the aggregate was 273,400,000 oz., which included about 30,000,000 oz. estimated conjecturally. However, of the estimated world's total in 1940 about 210,000,000 oz. was from the several silver-producing countries of North America, Central America (including the West Indies), and South America, and for those groups there is complete annual data through 1944. These show a steady decline, especially in the countries of North America. A reason for this is that their silver production is largely derived as byproduct from copper and lead ore and consequently has diminished along with the decline in the production of those base metals.

The production of silver in the United States in 1945 was about 30,000,000 oz. against 37,370,000 oz. in 1944. The production in Canada was about 13,000,000 oz., and in Peru about 12,000,000 oz., these being about the same totals as in 1944. Production in Mexico in the first six months of 1945 was about 32,000,000 oz. but there was some increase right after the middle of the year and the total may be 65,000,000 oz. against 63,000,000 in 1944.

SILVER STOCKS IN THE UNITED STATES

The stock of silver held by the U. S. Treasury was 97,286 tons avoirdupois at the end of 1942, 92,111 at the end of 1943, and 80,406 at the end of 1944. Of the last total about one-half was held as security against silver certificates used as currency and 30,000 tons had been loaned to defense plants for use as electrical bus bars and otherwise.

INDUSTRIAL USE OF SILVER IN THE UNITED STATES

During the war the industrial use of silver in the United States rose from an average of 33,000,000 oz. per annum in the triennium immediately prior to 1941, to an annual average of 120,000,000 oz. in the triennium following 1941. This exhausted stocks of foreign silver available at 45c. per ounce, which was the OPA ceiling. The shortage was ameliorated by passage of the Green Act liberating several hundred million ounces of Treasury silver, but only at a price of 71c., this liberation expiring at the end of 1945.

Use of the foreign or lower-priced silver was restricted to the most essential war needs, and users of silver for other purposes, such as the manufacture of silverware and jewelry, were required to use the higher-priced domestic or Treasury silver. The orders of WPB limiting the uses of silver were revoked Aug. 20, 1945, and continuance of different prices then became no longer practicable. Consequently OPA established 71.111c. per ounce as the uniform price for all silver—both foreign and domestic—effective Sept. 21, 1945.

FOREIGN SILVER MARKETS

Following the lifting of the price for foreign silver by OPA, the markets abroad rose commensurately. In Bombay silver rose one rupee three annas (32c.) and industrial corporation shares rose sharply. Even more acute was the disturbance in Mexico, which is not only on a silver monetary basis but also is a large producer of silver. The Bank of Mexico discontinued coining silver in as much as the rise in price made the peso worth 27.36c., instead of about 20c., which would make it profitable to melt coinage in circulation for the silver content. About 400,000,000 pesos were believed to be in circulation among individuals plus about 100,000,000 held by banks.

By decree, Sept. 25, 1945, the Bank of Mexico was given a monopoly in buying and selling all but industrially worked silver. By this decree the bank alone can export coin and bar silver, and silver producers must sell silver to the bank, which will supply industry. By another decree, subsidy was abolished and taxes were changed. The outcome of these readjustments was a present tax on silver of about 17c. an ounce, leaving about

9c. an ounce of increased value to the producers, who were promptly notified by labor leaders that they expected labor to have a share of the new profit.

The Canadian Government maintained its ceiling price of silver at 40c., Canadian funds, which was approximately in line with the American price when it was 35⅛c. When the price in the United States was raised to 44¾c. in September, 1942, the Canadian Government took no corresponding action.

IRON AND STEEL

By Thomas C. Campbell
News-Markets Editor, *The Iron Age*

THE LABOR PROBLEM

Steel company executives in 1946 would like to spend most of their time and energy on steel production and steel market competition, but the cards seem to foretell a different story. Unfortunately for them one of their most insistent problems will continue to be labor relations. Faced with one of the biggest strikes in its history, the steel industry may well ponder over the outcome of its current labor controversy, because whatever settlement is made will reflect the trend of labor relations for some time to come.

Since 1936 the steel union has spent most of its time obtaining recognition and higher wage rates. It was assisted considerably by the Administration at Washington in its fight for organization and wage demands. Now part of that phase of the union's activity seems to be at an end.

Unless the United Steel Workers of America (USWA) initiates a program of closer cooperation with steel companies for the purpose of increasing productivity per employee as well as assisting management in its competitive market angles, it will eventually become nothing more than "another union." If it becomes this, it will ultimately suffer a governmental strait jacket in the form of strict labor legislation.

STEEL MANAGEMENT AND THE PUBLIC

On the other hand steel management has only recently awakened to the fact, long known by others, that a positive relationship with the public can only be enhanced by a cutting of red tape and managerial egotism. For years the steel union has beaten the industry in obtaining space in the national press on controversial matters. The result has been that the union has obtained a far wider dissemination of its views than has management.

Some sources believe that once the present wage controversy is settled, the steel companies and the union can settle down and "enjoy" the production of steel sufficient to meet the nation's huge demand. The union now considers itself to be just as strong as the steel industry. On that basis it can be expected that the USWA will not rest, can not rest, and must continuously make fresh demands in order to keep the support of its large membership.

It is regarded as probable that once the union has obtained a higher wage rate in the present controversy and once it has offered terms to prevent unauthorized strikes, it will launch a drive for some sort of a guaranteed annual wage. When the current drive to keep the pay envelope at the wartime level is successful or partly so, it is logical to suppose that the annual wage demand will become a rallying battle cry for the union.

Since it will take some time for such a thing as an annual wage for steel workers to be debated, negotiated, accepted, or rejected, it will, however, serve to keep the union united in a common cause. Therefore, any steel official who looks for an end to his labor troubles would appear to be naive.

PRICE POLICY

Closely associated with the steel industry's labor problem is its price policy. Hemmed in by governmental red tape on one side and union demands on the other, the steel industry has unsuccessfully attempted to obtain a price increase. Washington officials dodged the whole price decision with the worn-out phrase, "We will look over your earnings for the fourth quarter." If any industry or company has been "looked over" on the question of price, it is certainly the steel industry.

It is true that the industry during the war did better pricewise than during the pre-war period because it was able to obtain the full published price. Furthermore, on shipments to areas not previously termed normal markets, the industry was allowed to charge full freight from the point of manufacture to the point of consumption. Also during the war the industry was able to charge and obtain many extras which were conveniently forgotten during the competitive pre-war periods.

Admitting this, it does not necessarily follow that the industry has "made out well." It merely shows that, if it had not been for these factors, the industry could hardly pay an average wage rate of more than $1.15 an hour, compared with 85 cents an hour a few years ago and 65 cents an hour in 1936.

Contrary to some backroom talk, the industry is just as aware of the peril in too high prices as are economists or market experts. Nobody realizes more than the steel industry that its future markets are endangered by inroads of other metals and products, if the price of steel were to go too high. Steel men are not being lulled to sleep by the fact that the greatest proportion of steel produced can not successfully be replaced by other materials.

Unfortunately the return on practically all steel products which do not face strong competition for other materials is so low that their load must be carried by the profits of some of the more or less specialized items. However, the latter happen to constitute that small portion of steel output which could suffer the greatest loss from other competitive materials.

THE QUESTION OF BASING POINTS

Already on its way, but still having some distance to go, is the recent trend towards more basing points. Several months after the Supreme Court had ruled in effect that a single basing point for an item made at more than one location was illegal, the U. S. Steel Corporation began multiplying its basing points. Probably realizing that sooner or later it would be a target for the Federal Trade Commission in the latter's drive for an F.O.B. mill pricing system, the corporation completed studies on the feasibility of naming additional basing points.

The first action was taken on stainless steel in 1944 when it went from a single basing point to a multiple basing point product. This general pattern of naming the place of manufacture of a product as a basing point was followed through on other steel items by U. S. Steel and by some other companies. The general program has by no means been completed.

It is expected that other steel companies will eventually increase their number of basing points with the ultimate result that the city at or near the point of manufacture will be made a basing point for the item made at that location.

The long-term tendency of multiplying basing points may cause some drastic changes in steel output geographically. For instance, in the case of the Pittsburgh district where competition with newly established eastern basing points will be keen, it may be that several steel companies will abandon some equipment there and replace it at a more strategic market location.

COMPETITIVE FACTORS

As a byproduct of the increase in the number of basing points, the search for technological improvements, the increase in wage rates, and the keener competition in the steel industry will once and for all eliminate what is left of the so-called umbrella under which the largest company or the larger companies automatically contribute to the position of the small producers.

For years larger steel companies have sold huge quantities of semi-finished steel to non-integrated firms only to face competition from those companies in the sale of finished steel products. It was not many years ago that a subsidiary of one company sold semi-finished material to an outside firm which in turn engaged in stiff competition with another division of the first steel company.

Now with larger steel mills requiring semi-finished steel for their own finishing mills, there is a market disposition drastically to slash the tonnage of semi-finished steel being shipped to the small non-integrated makers. For this reason it is expected that, unless management of the smaller companies can, like a few units in that category, find their own markets in the form of specialties or special services, the going may be so rough as to cause fatalities.

STEEL PRODUCTION

Turning to steel production which in 1945 amounted to about 80,000,000 tons, a drop of more than 9,500,000 tons from 1944, output in 1946, if the steel strike is not prolonged, may run as high as 83,000,000 tons. The crux of the year's production will depend upon product mix, possibility of price relief, and the abandonment or non-use of high-cost equipment.

No steel producer in 1946 will continue to make products on which the loss is too great nor will he utilize old equipment which is too costly to operate. It would be worth more to the company to operate at a lower rate, making products which reflect a better return than to operate at a higher rate with products which must be "carried" by more profitable items.

The industry will not lack a demand for steel over the next few years at least. Backed-up requirements for peacetime production appear to be heavy enough to support a steel ingot rate of from 70 to 80 per cent for the next two or three years. Some analysts in the steel industry are estimating four good operating years before any serious decline is noted.

The production of alloy steel in 1945 declined somewhat from wartime peaks. About 11 per cent of total steel production in 1944 constituted alloy steel, whereas in 1943 it accounted for about 15 per cent of total steel output. It is believed that, while the participation of alloy steel will not decline to the pre-war figure of 6 per cent, it may drop to around 8 per cent in 1946.

Open-hearth operators in 1945 were rapidly regaining the alloy business which they lost to the electric furnaces during the wartime peaks. In 1945 open-hearth furnaces supplied slightly more than 67 per cent of the alloy steel as against 66 per cent in 1944. During some months in 1944 the participation of the open hearths had been cut to as low as 64 per cent.

Because of the drop in alloy steel output and the increased use of open

PIG IRON AND STEEL OUTPUT IN NET TONS

Year	Pig Iron	Steel
1945	53,700,000*	80,000,000*
1944	61,939,000	89,642,000

* Estimated.

hearths for making alloy steel, electric steel capacity during 1945 was not utilized to anywhere near the extent experienced in 1943. In the third quarter of 1945 electric steel capacity operated at only 51 per cent as against 76 per cent in the third quarter of 1944 and 86 per cent in the first quarter of 1944.

The existence of such a large amount of unused capacity will serve to accentuate the post-war competition between open-hearth alloy steel and electric alloy steel. There is no indication that open-hearth makers will give up any business which they feel is theirs.

COAL AND COKE

By R. Dawson Hall
Engineering Editor, *Coal Age*

PRODUCTION FACTORS

In 1945, the production of bituminous coal and lignite was 576,000,000 net tons as against 619,576,000 in 1944, a decrease of 43,576,000 tons and a 7 per cent drop. The output of anthracite dropped from 63,701,000 to 54,476,000 tons, a decrease of 14.5 per cent. Production of beehive coke declined from 6,974,810 in 1944 to 5,194,750 in 1945, a fall of 25.5 per cent. All the coal made into byproduct or beehive coke is credited to bituminous and anthracite production depending on the source of the coke, the use of anthracite being of insignificant proportions. These are tentative figures; the actual figures must await further returns. The bootleg coal produced in the anthracite region is not included in these figures nor will it be included in the final result. If it were, the percentage drop in production would be still greater for the bootleg production has declined, and most of the men have returned to legitimate operations.

Production was hampered all through the year by labor disturbances, and always by lack of manpower and supplies. In making its demands, the aim of the labor union, the United Mine Workers of America, was to concentrate its demands on subsidiary payments, on a royalty of 10¢ a ton to be paid to the union and to be expended by that organization for the health, rehabilitation, and "economic protection" of the mine workers, on vacations, on payments for transportation time involved in traveling in the mine to and from work and on other similar provisions —so-called "fringe compensations"— rather than on increases in basic wage. Thus, it ingeniously planned to escape the restrictions of the Little Steel formula. It claimed that these were not wage concessions, but the removal of injustices in working conditions.

SOFT COAL CONTRACT

In order that a strike could be declared legally, April 1, when the contract in the bituminous and lignite mines would expire, the U.M.W.A. on Feb. 26, 1945 served notice on Secretary of Labor Frances Perkins, under the Smith-Connally Act, that "a labor dispute exists" between it and the bituminous coal operators. The intention was to start the "cooling off period" so long before the expiration of the contract that the period would end before the contract expired and a strike could start without delay.

In the name of the Southern Coal Producers' Association, E. R. Burke, its president, filed, with the National Labor Relations Board, a petition asking that no strike vote be taken, because there was no dispute; both sides were still preparing to discuss a new contract in place of an agreement that would not expire until April 1. On Mar. 12, Burke's request was denied, and 140 field examiners and 4,000 special agents were hired to take the poll, which followed Mar. 29 and resulted in an overwhelming vote, 208,797 to 25,158, in favor of such a suspension.

Prior to that time, the operators offered to concede, Mar. 16, full-time for travel from the mine portal to the working face and back to the mine portal, "full portal-to-portal time" as it is officially designated. Under the expiring contract, payment was made for only two-thirds of the time thus expended or 50¢. This payment the operators agreed to make 75¢. They offered to pay also 4¢ per hour extra to men working on the second shift and 6¢ per hour extra for the third shift. They refused to pay for the time spent for lunch and insisted that overtime should start only after seven hours of work. The concessions would have raised the day's wage 49.6¢. Another concession was vacation pay to employees with one year of service equal to 2 per cent of straight time for the preceding year (a minimum of $50), while employees with five years of service or more would get 4 per cent (a minimum of $100). The demand for a participating royalty was rejected.

An extension of the existing agreement was ordered, Mar. 31, by the War Labor Board on a basis that would make the contract, when signed, retroactive to April 1. The operators accepted this arrangement, but would not stipulate their acceptance of financial responsibility for fulfilling the retroactive clause, nor post a security bond or put money in escrow for fulfillment of the pledge. On April 1, J. L. Lewis, president of U.M.W.A., advised the W.L.B. that the union recommended its membership to remain at work.

On April 3, despite orders from the union to continue working, 80,000 soft-coal miners struck. In Alabama, 95 per cent of the men were idle. Negotiations continued but reached a deadlock, April 6. The operators stated that they would hand over the matter to the W.L.B., the following day, but as Lewis showed signs of relenting, the Labor Board was apprised that the operators would make another attempt to conclude a contract. On April 10, there being still no agreement, Secretary of the Interior Ickes took possession for the Government of 235 bituminous mines in seven states. As a result, a new agreement was signed calling for an increase in basic earnings as estimated by the operators at $1.25 to $1.30 a day putting up coal costs about 25¢ a ton.

Payment for travel and luncheon time for a six-day week was increased $6.44 or $1.07 a day. Four cents an hour additional was granted to second-shift workers and 6¢ an hour to third-shift employees. Annual vacation pay was raised from $50 to $100. Mr. Lewis relinquished his demands for 10¢ a ton "royalty" and for the inclusion of most of the foremen in the union, as also for several wage concessions and changes in working conditions. The W.L.B. promptly approved the agreement, April 23, estimating the increase in earnings of the employees from all the several changes as $1.02 per day for a six-day week. A large part of the increase stemmed from full portal-to-portal pay, 81¢ per day for all miners. The U. S. Circuit Court of Appeals had interpreted the law as requiring full-time compensation for such travel.

ANTHRACITE CONTRACT

On March 27, Lewis for the U.M.W.A. filed a notice of a labor dispute between the Pennsylvania anthracite operators and the miners, excluding the Philadelphia & Reading Coal & Iron Co., then under Federal control. On April 18, the 29 mines of this company were restored to it after seven months of government operation. During the month of April, the mine workers and operators tried without success to conclude a contract. On April 26, the vote was taken and the miners elected to strike by a vote of 41,952 to 6,697 (78,789 being eligible to vote), and on May 1 all the mines were idle.

The operators already had agreed to work the mines for 30 days with pay retroactive to May 1, if a settlement should be reached within that period but Lewis refused any such arrangement. A wage increase of 25 per cent was demanded, also a 10¢ royalty per ton. Second shifts were to receive 10¢ additional pay per hour and third shifts 15¢. In all, there were 30 demands. After three days of idleness, Secretary Ickes took possession of the mines and called on the mine workers to return to work on May 7, but 363 operations still remained closed, awaiting word from Lewis, who remained silent. On May 17, the U.M.W.A. accepted a new agreement with provisions for underground travel-time pay, overtime for work exceeding seven hours a day and 35 hours a week, differentials of 4 and 6¢ an hour for second and third shifts respectively, and a $75 instead of a $50 vacation allowance. This agreement was approved by the W.L.B. June 2.

SUPERVISOR STRIKE

A long time earlier, Lewis had established a section of the U.M.W.A., termed "District 50," in which all persons whose fortunes were in any way linked with coal, even in the most remote manner, might invoke protection. One of the more reasonable affiliates of this "district" would have been the United Clerical, Technical and Supervisory Workers Union, as it included such persons as were employed by coal companies, had it not been that the contracts made with the U.M.W.A. expressly excluded the unionization of these representatives of the management. On Sept. 21, the foremen belonging to this union and located at four coal mines of the Jones & Laughlin Steel Corp., walked out, following a N.L.R.B. strike vote, and, on Sept. 28, after the strike movement had spread, Lewis requested the bituminous coal operators to meet in Washington to settle the question of the recognition of the U.C.T.&S.W.U. On their refusal, Lewis dubbed their action "insolent." At that time, 105 mines with a total production of 228,000 tons per day and employing 42,169 men had closed.

When the supervisors of a coal mine no longer work, the mine must close because the law rules that the presence of such men is necessary for safe operation. It is stated that, in many instances, the mine workers compelled the supervisors to forsake the mines and join the union and thus excused their own absence from the mines. They tried to get unemployment compensation as being laid off by reasons beyond their control.

Both sides in the controversy finally agreed to confer with Secretary of Labor Schwellenbach, Oct. 6. The conference lasted three weeks until 210,000 miners were idle causing a loss of more than half the daily national tonnage. The Solid Fuels Administration for War set the total production loss at 13,000,000 tons, when Lewis, Oct. 17, without any explanation ended the strike of both supervisors and supervised for which he had claimed consistently he had no responsibility, but he stipulated no fines must be assessed or collected or a strike vote would be requested of the N.L.R.B. The National Bituminous Coal Operators' Negotiating Committee agreed that the operators, in view of the national crisis, would overlook the fines provision which the contract with the mine workers contains.

STRIPPING PROGRESS

In 1944, of the bituminous and lignite tonnage, 15.3 per cent was produced by stripping the material from above the coal and mining the coal thus exposed. That proportion in 1942 was only 11.5 per cent. Great progress recently has been made in "outcrop stripping" where the coal at the edges of the deposit is covered by such a weak and shallow capping of rock that it can not safely and economically be recovered by underground mines. Such stripped coal, as is covered by sufficient protective rock and as is, on removal, cleaned and prepared, enjoys an increasing reputation, though some stripped coal, especially outcrop coal, is still indifferently prepared for the market. Exposure reduces sulphur content, and suitably mined and prepared stripped coal should improve the deep-mined coal where mixed with it. Some of the premium coal producers are now stripping and mixing the product with the output of the mine.

TRAINING MINE CRAFTSMEN

An employee-management forum has been introduced at the mines of the Pennsylvania Coal Co., Scranton, Pa. to discuss mine technique. A school started in Logan County, W. Va., to train men for war work soon drew off excess labor to distant towns and was about to close. Instead it was reorganized to train workers in and for the mines. Its teachers are trained by men supplied by the Island Creek Coal Co. and the West Virginia Coal & Coke Co.; other sources that can furnish such help are the State Department of Mines, W. Va. University, the United Mine Workers, and machinery manufacturers.

A machine shop, well equipped, a drafting and blueprinting room, a welding shop, a forging department, an electrical shop including the framework of a house for house wiring, and a mine entry with side rooms constructed of wood are provided for instruction in the several mine crafts. Of 172 enrolled students, 15.1 per cent come from a farm area and 17.4 per cent are using the school for bettering their knowledge of their several crafts.

Thirty-four bituminous operating companies in Pennsylvania and West Virginia and 15 anthracite companies in Pennsylvania are using the job-relations training course of the War Manpower Commission's Training within Industry service. The school for training miners, sponsored by the Lehigh Valley Coal Co., at Wilkes-Barre, and Pittston, Pa. is to be extended to Scranton, Dallas, Berwick, Shickshinny, and Tunkhannock, all in Pennsylvania. Nine scholarships—four for under-graduates (a term of four years), four for master's degree (a one-year course), and one for a doctor's degree (three-year course)—have been offered by the Sahara Coal Co., Chicago, at the University of Illinois. Preference is to be shown to applicants from Saline County (where the company operates mines) and to those whose fathers are now, or were formerly, employed by the Sahara Coal Co. A rescue station, sponsored by operators in the western part of Colorado, has been established at Somerset, Col. to serve seven mines and to provide a fully fitted six-man team.

PORTAL-TO-PORTAL PAY

Whether bituminous-coal miners are entitled to pay for all the time spent within the mine, including going to and from their work (portal-to-portal pay), was decided in favor of the miners by the Fourth U. S. Circuit Court of Appeals, Oct. 6, 1944. On Jan. 5, 1945, the U. S. Supreme Court agreed to review the issue, granting a writ of certiorari to the Jewell Ridge Coal Co., by whom the "right" had been contested. The case came up for hearing, March 9, and portal-to-portal pay was upheld by a 5-to-4 decision, May 7, as mandatory under the Federal Wage and Hour Act.

Justice Murphy declared underground travel in bituminous coal mines "bears all the indicia of work" —physical and mental exertion, exertion controlled or required by the employer and exertion pursued for the benefit of the employer and his business." Payment has not been customary, but the act was not intended to codify customs that allowed "the employer to claim all of the employee's time while compensating him for only a part of it." The dissenting opinion declared that the act was not intended to overthrow existing contracts made by collective bargaining.

STRIPPING LEGISLATION

The public continues to protest at the "unsightliness" of the overturned surface at strip mines. West Virginia and Pennsylvania passed laws requiring bonds to be given for each acre stripped. In Ohio, Illinois, Missouri, and Indiana, efforts were made to regulate stripping, but without avail, for many believe that the land is more fertile after stripping than before, more picturesque after reforestation, and a source of revenue to the community which receives a big price for the coal land and returns from the wages of the miners, thus being benefited by the operation.

STATE LEGISLATION

West Virginia requires that the ground be restored to its former condition and that vines, trees or shrubs be planted, under the specifications to be set forth by the Mines Department and the West Virginia University Agricultural Experiment Station. Bonds of $500 an acre or a minimum of $1,000 are required. The Pennsylvania law requires that a bond be pledged of $200 per acre up to a limit of $1,000 to assure compliance with legislative requirements. A license fee of $100 is demanded. Three suits have been promptly filed against the enforcement of the law.

In Ohio, Governor Lausche gave the stripping bill every assistance despite Deputy Solid Fuel Administrator C. J. Potter's opposition, who declared it would hamper the war effort. The bill failed, 58 to 53. In Illinois, the Paul Powell bill, levying a tax of 4¢ a ton on strip-mined coal after Sept. 1, 1945, with the product of the tax to be used to restore the topography of the terrain, actually passed with a vote to spare, but Governor Green vetoed it, because he was opposed to all new taxes at this time and because it was discriminatory. In Missouri, the Neel Stripping bill was killed by a vote of 55 to 45, but a bill to assess 5¢ a ton was introduced later. The Indiana bill was defeated 22 to 62.

GAS TURBINES IN LOCOMOTIVES

A fund of $1,100,000 has been established by six major eastern railroads, three large coal companies, and Bituminous Coal Research, Inc. A Locomotive Development Committee has been created to administer the fund. The purpose is to incorporate the gas turbine in the design of locomotives using coal as fuel. Dr. J. L. Yellott will direct the investigation. At present, it appears that the method of operation will be burning pulverized coal and removing mechanically as much flyash as possible. Johns Hopkins University and the Institute of Gas Technology will study the pulverization of the coal, and Battelle Memorial Institute its combustion and the problem of ash removal. The coal will be pulverized by (1) subjecting the crushed coal to a high pressure of air or steam filling its crevices, and (2) passing this coal through a nozzle to a chamber at low pressure, where the entrapped air or steam will expand and burst the coal particles. The coal will be burned at a pressure of 60 lb. per square inch. An attempt will be made to combine the combustion chamber with a cyclone to remove large flyash particles to a degree needed to protect the turbine blades against excessive erosion. The temperatures will be kept below 1,200° F. to prevent slagging and 400 per cent excess air should eliminate smoke.

SMOKE ABATEMENT

Recognizing the difficulty during the war in getting the right kind of coal to suit installed equipment and in getting replacements for present equipment, most cities have been lenient in enforcement or in initiating new ordinances. The war over, the Commissioners of Allegheny County, Pennsylvania moved, Nov. 13, to draft anti-smoke regulations patterned after Pittsburgh's considerate ordinance of 1941. Anticipating a revival of activity in drafting of such ordinances, the Coal Producers Committee for Smoke Abatement, at Cincinnati, O., Oct. 15, undertook once again to assist municipal authorities in cities using Appalachian and western Kentucky coals in preparing technical data on which to base their smoke-abatement ordinances. Accordingly, Toledo, O., which had passed an ordinance restricting the "kind of coal" that may be burned in hand-fired furnaces, will be surveyed by employees of this coal-industry-and-railroad group.

STEAM JETS OVER FIREBED

Use of steam-jets to eliminate smoke in furnaces is an old device, but until the Battelle Memorial Institute for Bituminous Coal Research experimented with it and developed standards of construction it was a hit-and-miss, and always a noisy and extravagant device. Following tests at Baltimore, Md., the Pennsylvania Railroad announced that it would install such jets on all of its steam locomotives where they may, by any possibility, emit obnoxious smoke. The Illinois Central Railroad announced its intention later to put these jets on its 80 switching locomotives in Memphis, Tenn. Late in October, 666 locomotives on 24 railroads had been equipped with the new type jets and silencers; most of these railroads expect to continue to install them in their steam locomotives.

BATTELLE RESEARCH

Studies have been made by the Battelle Memorial Institute to determine the quantity of rock salt or flake calcium chloride to use for freeze-proofing coal shipments for several anticipated outdoor temperatures, and to determine where the material should be applied. Corrosion of stoker screws in residential underfeed stokers was found by B.M.I. to be owing to (1) evaporation of moisture from the coal by the heat derived from the retort end of the tube, (2) backward diffusion of water vapor along tube toward bin or hopper, and (3) condensation of moisture on coal and screw.

Even quite dry coal will suffice to cause such corrosion. Oxidation of the pyrite in coal makes it acid, and corrosion is thereby accelerated. Calcium chloride, if present in the coal mass, also accelerates corrosion, but the three conditions detailed are more important than the acidity of the coal or the presence of calcium chloride.

Waters dripping through mine roofs where sulphur is present are found nevertheless, declares the B.C.R. Mining and Preparation Committee, to be alkaline wherever tested, but the mine waters leaving such mines sometimes are acid, sometimes alkaline. Acid mine waters are predominately sulphates of iron, aluminum, manganese, calcium, magnesium, sodium, and probably potassium. Alkaline waters show no appreciable quantities of iron, aluminum or manganese in solution. The effectiveness of mine sealing in reducing sulphate formation, the importance of the action of bacteria in acidifying mine waters, and the effect of the oxidation of pyrite on the deterioration of mine roof will be studied. Coats of paint, in the Appalachian region, have not been successful in protecting mine roofs, but further tests seem justified.

Flash drying, in which fine coal is dried in suspension in a vertical stream of mingled heated air and combustion gases, will be tried as a means of reducing the surface moisture of coal being prepared for the market. Picking tables need more suitable, rather than more abundant light, to enable pickers to differentiate between bony and pure coal. Cost of district residence heating has been studied at Columbus, O., by the B.M.I. The committees of the American Mining Congress are continuing their work on mining problems.

OIL-SHALE RESEARCH

On Feb. 24, 1945, the U. S. Bureau of Mines announced its selection of Rifle, Col., as a location for a $1,500,000 oil-shale plant, which is to be operated in connection with a laboratory to be constructed at the University of Wyoming, Laramie, Wyo. The plant will mine 200 tons of shale per day. A $17,500,000 converted war plant at Louisiana, Mo., is to be used by the Bureau for the production of synthetic gasoline from coal and oil. A new laboratory and research unit will be erected by the Bureau to conduct experiments in the production from coal of the gases required in the manufacture of synthetic liquid fuel.

The possibility of pelletizing fine sizes of anthracite and making the pellets suitable for shipment and combustion is being studied at Pennsylvania State College, State College, Pa. A bill has been signed in Illinois providing for an $80,000 research project to determine the commercial possibilities of Illinois coal. The Lehigh Navigation Coal Co. is building a plant to utilize the carbonaceous refuse from three breakers for the manufacture of a light-weight aggregate to be used with cement.

HAULAGE

During 1945, careful attention was given to the possibility of improving haulage methods. Always dangerous underground, higher speeds and heavier loads have increased these dangers, but these risks have been met by improved equipment. However, modern haulage, being electrical, has increased dangers considerably. In the Pittsburgh region, several committees have been appointed to study point by point, the several phases of this subject: heading driving, track construction, wire erection, maintenance of both headings and electrical equipment, location and handling of reclosing circuit breakers and the fighting of mine fires.

In *Information Circular 7032,* the U. S. Bureau of Mines discusses the two-wire overhead trolley system, battery and Diesel locomotives, their defects and those of circuit breakers, which, while introduced to make electric systems safer, have nevertheless their limitations where heavy currents are transmitted. Guards for trolley wires are illustrated and described in *I.C. 7332.*

FIRE CONTROL

Electric short circuits, having caused many mine fires, the bigger companies of Pittsburgh have pooled their talent into committees to consider all the ways, direct and indirect in which electric mine fires can be caused, prevented and extinguished.

Experiments have shown that moisture makes it easier for a flame or hot particle to ignite black powder, unless the powder gets damp enough to disintegrate. Fine-grain powders ignite more readily than coarse-grain powders. Heat black powder to a certain temperature and its own internal reactions will make it steadily hotter until it explodes. Blows have less and less ability to explode black powder after the moisture increases above 2 per cent *(Report of Investigations 3782,* U. S. Bureau of Mines). The Bureau, at the end of February, declared that the limit charge for "permissible" explosives, sheathed or unsheathed, fired from a single hole had been raised from 1½ to 3 lbs., permitting the use of deeper undercuts which can not be utilized without larger charges of explosive than had been "permissible."

ROCK-FALLING IN MINES

Microseismic disturbances in rocks under strain become ten to 100-fold as frequent as rocks begin to fall, thus giving premonitory warning of approaching collapse. The larger the area affected, the longer will be the period of increasing microseismic activity prior to failure *(R.I. 3797).* By compressing small rock specimens in a laboratory, tremors are produced as in mines. Coarse-grained rocks will have an average of 1,000 such tremors, and fine greenstones less than 200. Number of tremors depends on applied pressure and the rate of its application *(R.I. 3803).*

Lignite dust containing 20 per cent of moisture can be ignited both by electric arcs and by flames of detonating dynamite, but it is exploded less easily than the dust of low-moisture high-volatile coals *(I.C. 7322).* Use of flaked calcium chloride or of refined granular sodium chloride for allaying coal dust on shuttle-car roads is advocated by the U. S. Bureau of Mines *(R.I. 3828).* Driving of mine shafts by huge rotary drills of diameters larger than the completed shaft is recommended in *I.C. 7336* as also the lining of such shafts with a steel casing backed by concrete. A method of determining dust concentrations by collection of dust on filter paper is described in *R.I. 3788.* As the paper is dry, bacterial deposits on such paper do not grow, and the dust does not dissolve. To count the dust, it is removed by ethyl alcohol or other liquids.

SURFACE WATER

Ethyl alcohol can be used to absorb surface water from coal and thus make a rapid determination of such water. It can be used again and again until its water content is excessive. The quantity of water dissolved can be determined by a hydrometer *(R.I. 3811).* Unless coal is very dry, oiling will increase the density of the charge in a coke oven and improve the coke, but in some cases it may cause the charge to expand, thus damaging the ovens *(R.I. 3807).* Plasticity indexes, as determined by the Davis and Gieseler plastometers, give as good an indication, as proximate coal analyses, of the physical properties of the cokes to be derived from the coals (Carnegie Institute, *Contribution 115*). For coke making, low-volatile anthracite fines are perhaps preferable to those of higher volatility. From 3 to 5 per cent of anthracite may be used. Choice of anthracite and how much shall be added to the coal to be coked to lessen checking is a separate problem for each plant *(R.I. 3808).*

PACKAGED FUEL

The anthracite region has for many years been producing fine sizes of coal for which there was either no market or an inadequate demand. Some has been briquetted, but the excessive quantity of binder made the product costly. During the war, these fine sizes always readily made available, attracted attention, and the Defense Plant Corp. furnished the capital for Blaw-Knox Co. to erect a plant for making a fuel containing 70 to 80 per cent of anthracite fines blended with 20 to 25 per cent of Pocahontas No. 3 bituminous coal, further crushed, dried, and treated before being compressed into 3-in. cubes with an asphaltic binder. Wrapped six in a package by automatic machines with 267 packages to the ton, they are known as "White Glove Packaged Fuel." The plant has a capacity of 500,000 tons a year. The Philadelphia and Reading Coal & Iron Co. has erected two briquet plants, one at its Locust Summit plant and the other at the St. Nicholas plant.

NON-FERROUS METALS

By Walter Renton Ingalls
Consulting Engineer, New York

PRODUCTION AND PRICE FACTORS

During 1945, as in 1944, the use of the non-ferrous metals continued to be restricted in the main to military munitioning, but there was further release of some metals for ordinary consumption, except that lead and tin continued to be severely restricted. The cessation of fighting in Germany, early in May, was not allowed to lead to any great relaxation of effort, but after the surrender of Japan, in August, conversion to civilian consumption proceeded rapidly.

In reviewing the history of the non-ferrous base metals in 1945 it is best to refer to them jointly in a prefatory way, for economic conditions were common to most of them. Among these were shortages of labor, frequent strikes, embarrassments arising from pre-war labor legislation (especially in respect of an industry organized on the basis of 24 hours per day and 300 to 365 days per year), waning resources of ore and exigencies of importing, subsidizing of uneconomic operations, WPB and OPA controls, etc. These were among the difficulties experienced especially by the producers of copper, lead and zinc.

PRICES AND PREMIUMS

The price for copper in 1945 continued to be 12c. per lb., delivered in Connecticut; lead 6.5c. per lb., New York; common spelter 8.25c., East St. Louis; aluminum 15c.; magnesium 20.5c.; nickel 35c. and tin 52c., New York. The prices for copper, lead, and spelter were the ceilings established by OPA, but these prices being inadequate to invite maximum production, especially in view of increasing economic adversities, producers were stimulated by subsidies. Consequently the actual cost to the Government of all the copper produced in the United States in 1944 was 13.5c. per lb.; of lead 8.17c.; and of zinc 11.04c. Approximately one-fourth of our domestic copper production in 1944 had thus to be subsidized, one-half of our lead production, and about 60 per cent of our production of spelter. These conditions continued through the first semester of 1945, but, after the surrender of Japan, cancellation of foreign contracts for copper and of domestic subsidies occurred without much delay, but not so sharply in respect of other metals that continued in short supply, especially lead and zinc. It is now accepted that the lead and zinc mines of the United States have waned so extensively that they will be unable to supply domestic requirements; wherefore, this country will become regularly an importer of lead and zinc on a large scale. Our domestic copper mines are still capable of adequate supply, but the country will cease to be an exporter of copper.

ORE RESERVES

As reported by E. W. Pehrson of the U. S. Bureau of Mines, estimated lead and zinc reserves of the United States, recoverable under pre-war operating conditions, are now as follows: Lead, 5,000,000 tons of which only one-third classed as measured and indicated. These estimates are on the basis of 6c. for lead and 6c. for zinc. Under emergency conditions the lead reserve might be 6,600,000 tons and the zinc reserve 17,000,000. The pre-war consumption of lead and zinc in the United States was 500,000 to 600,000 tons per annum, respectively. In respect of both of these metals, metallurgical efficiency has been raised so high that no ores are now incapable of beneficiation. Not during the last 20 years have there been discoveries of new ore deposits. Attention must now be directed to the search for deep, concealed deposits. It is worth mention that, since the beginning of the war, the dezinking of old lead smelting slags has afforded the United States a new supply of zinc which in 1944 was upward of 50,000 tons.

TARIFF PROTECTION

Economic conditions in the United States led to grave concern with respect to tariff legislation under consideration during the early part of 1945. The tariff on pig lead, 2⅛c. per pound in the tariff act of 1930, was by presidential proclamation, effective Jan. 30, 1943, reduced to 1 1/16c. for the duration of the war, after which it was to be 1.7c. Similarly the tariff on spelter, 1¾c. by act of 1930, was reduced to ⅞c. per pound, during the war, going up to 1.4c. 30 days after the termination.

The President's V-J proclamation would have brought the post-war rates into effect Oct. 2, but no tariff proclamation was made. The enactment of the legislation in June, 1945, giving the President the right to make additional tariff reductions, up to 50 per cent more, alarmed domestic producers of lead and zinc. American producers fear that foreign costs of production are so much lower than our own that the very existence of their industries is in jeopardy, unless they have adequate protection. It was of record that, in order to obtain a production of 716,000 tons of spelter in the United States in 1944, an average price of 11c. per pound had been required, while producers in Australia and Canada had supplied their immense outputs to the British government at less than 4c. per pound, in depreciated currency.

A tariff of 4c. per pound was imposed on imports of copper by the revenue act of 1932. Although this has been construed as an excise tax, the Department of State holds that copper is not exempt from the authority granted by the reciprocal trade agreements act of June, 1945

ACCUMULATED STOCKS

Stocks of copper, lead, and zinc had accumulated to large proportions in 1944, besides which fired cartridge cases of brass were already coming back on a large scale and there was concern in respect of possible liquidation of surpluses. This was eased by Congressional enactment, Sept. 19, 1944, withholding stocks from liquidation for a period of 15 months and to such extent as the Army and Navy through the Munitions Board should pronounce needful for national security.

The Munitions Board report, dated Jan. 2, 1945, stated that in view of the "likelihood that in a future war we shall not have the time required to make the necessary provision for materials it is important that an early beginning be made toward accomplishing a sound stock-pile program." The Board withheld from publication "for reasons of military security" the quantities of materials in its recommendations for stockpiling, but they are believed to be large.

During October, 1945, identical bills were introduced in the Senate and House of Representatives to provide for the indefinite holding of stockpiles of metals and materials accumulated by government agencies during the war.

EUROPEAN PLANTS

By the end of September we had authentic, first-hand reports of the situation of metallurgical plants in Europe. On the whole they escaped with surprisingly little damage, suffering mainly from neglected upkeep. In the occupied countries—especially Belgium, Holland, and France—production during the war was small, owing to absence of supplies of ore and fuel, shortages of which and transportation difficulties being the chief obstacles against resumption for full-scale operation. Plants in Germany were more severely damaged, but not irreparably, and some of the more important of them were in partial operation during the third quarter of 1945. The copper mines and metallurgy at Eisleben (Mansfeld) and the zinc plant at Magdeburg (Giesche) are in the Russian area of occupation. The production of lead and zinc in Upper Silesia had been restored to a substantial scale by the middle of 1945.

ALUMINUM

At the end of 1943, listed aluminum ingot capacity in the United States was for an annual rate of 1,182,000 tons, and in the first half of 1944 there was an actual production of 460,000 tons. This manifestly afforded an oversupply, and during the second semester of 1944 there was an extensive closing of plants which reduced monthly production to about 50,000 tons. During the year 1945 it ranged from 44,000 to 53,000 tons per month. Plants continuing in operation were those owned by the Aluminum Co. of America (Alcoa); those owned by RFC and operated by Alcoa under lease; and those owned and operated by the Reynolds Metal Co. With the cessation of hostilities and cancellation of war orders for airplanes and other armaments, the capacity of the RFC plants was no longer required, Alcoa surrendering its leaseholds as of Nov. 1, 1945. The plants thus returned were at Jones Mills, Ark.; Los Angeles, Calif.; Massena, N. Y.; Spokane, Wash.; and Troutdale, Ore. Plants at Maspeth, N. Y., Burlington, N. J., and Riverbank, Calif., had been surrendered in 1944. At the time of this writing nothing had been decided in respect to the future of these surplus plants. Alcoa built and operated them for the benefit of the Government, without profit to itself.

Meanwhile, government opposition to Alcoa continued. The long drawn-out anti-monopoly case had been decided in favor of the company on every count in proceedings in 1938 in a Federal District Court in New York. The Government appealed to the Supreme Court, which resulted in a stalemate, there being too few of the justices, free from prior associations, to constitute a quorum. By agreement the appeal was then referred to a special court of three jurists appointed by the President of the United States. This court decided that Alcoa formerly had been a monopoly in the production of ingot aluminum in the United States but, with the advent of recent competition, has ceased to be so; and otherwise reaffirmed the decision of Judge Caffey in the Federal District Court. In September, 1945, the Department of Justice proposed legislation to Congress to bring about the dissolution of Alcoa.

Disposal of the DPC alumina and aluminum plants, built at a cost of $700,000,000, is a current problem. Alcoa is out of favor with the Department of Justice, which desires to increase competition with it. Alcoa expressed itself as not averse to fair competition but disliking subsidized competition. Alcoa offered to lease the alumina plant at Hurricane Creek, Ark., and to make the product available to competitors at 2c. per pound, or lower, according to quantity, the price in October, 1945, being 2.5c. Other concerns had previously expressed interest in some of the reduction plants, but no one had offered to purchase. Plants that are regarded as favorably situated are those at Jones Mills, Ark., Troutdale, Ore., and Massena, N. Y. The plant at Maspeth (Queens), greatest of all, has already been dismantled.

At the beginning of 1945 the Government stock of virgin ingot was 267,000 tons, besides which there was 15,500 tons of secondary ingot. Owing to a temporarily accelerated demand these stocks were reduced to 168,000 tons at the end of the first quarter, and at the end of September were 192,000.

COPPER

The world's production of copper in 1941-44 aggregated somewhat more than 3,000,000 tons per annum without much change from year to year. Plus or minus in the outputs of some countries were offset oppositely in others. This includes allowances for several countries for which statistics are wanting. It is known that the domestic production of Germany was no more than the pre-war rate of about 25,000 tons per annum, and that the Bor mines of Yugoslavia, which passed under German control, yielded no more than their maximum pre-war rate of 47,000 tons. It is doubtful if the Japanese were able to get much more than 100,000 tons from their own mines and from the mines in the Orient that became available to them. The mines in Finland, Norway, Sweden, and Turkey (Asia Minor) were unable to produce much more than to satisfy domestic needs.

When the refineries of Germany were seized they were found to be well stocked with roofing, statues, bells, etc. stripped from conquered countries. Even so it is clear that the Germans must have conducted their warfare with supplies of copper small in comparison with those enjoyed by the Allies. Of major importance was the development by the Russians of a great steam-shovel mine near Bertys Bay, Lake Balkhash in Kazakhstan, which began production in 1939, and which together with other new production in Kazakhstan may have raised the total production of Russia and Siberia above 250,000 tons per annum. Although Russia obtained copper and copper alloy from the United States under lend-lease, it is to be foreseen that Russia may cease to be an importer of copper.

In the United States supplies were received from Chile and Africa, which, added to domestic production, gave us about 1,800,000 tons of newly refined copper per annum. Domestic production attained a maximum of 1,114,000 tons in 1943 and thereafter waned through shortage of labor and other adverse economic conditions. Of our imported copper 80 per cent was produced at 11.75c. per pound and 20 per cent at prices above the OPA ceiling, resulting in an average price of 12.4c. per pound, thus reflecting that the cost of production in Chile, through higher terms for labor, taxes, and otherwise, had increased as it had in the United States.

Of the great consumption of copper in the United States, the major part of it was for ammunition, and nearly all of it was for military purposes, the domestic allowances for telephone, electric light and power, and railway service being severely curtailed, while for non-military motor vehicles and general building they were reduced to practically nothing at all.

Following the surrender of Germany in May, 1945, the manufacture of ammunition continued at a high rate, but after the surrender of Japan it was quickly ended. However, the civilian demand for copper developed in such volume that substantial releases from MRC (Metal Reserve Corporation) stock had to be made to satisfy it.

The total stock of copper held in storage by MRC as of Sept. 30, 1945, was 543,843 tons, including copper content of ore, some of which was stored in Canada and in Chile. Included is the MRC stock of refined copper in the United States, amounting to about 400,000 tons. Not included are stocks in Army arsenals, Navy yards, etc. The stock of refined copper in possession of the British Government in the middle of 1945 has not been officially declared but is intelligently surmised to have been about 400,000 long tons. Following V-E day some of the copper-starved countries, especially France, were quick to draw supplies from Great Britain.

LEAD

The history of lead in 1945 is similar to that of copper with the difference of a sharper decline in domestic production, although supported by stiffer subsidies. Domestic production being insufficient for our needs, it was necessary in the four-year period of 1941-44 to import 1,100,000 tons of refined lead, over and above what we derived from lead in foreign ore brought here for smelting and refining. These imports were derived chiefly from Australia, Canada, and Mexico. This led to an accumulation of about 275,000 tons of MRC reserve stock in the early part of 1943, which was reduced to 90,000 tons at the beginning of 1945, and to 86,000 at the end of October.

Allocation of lead supplies was controlled severely by WPB throughout the war and subsequently. Lead did not enter into ammunition so extensively as in former wars, lead bullets having been replaced largely by armor-piercing steel projectiles. On the other hand, the military requirements for lead for tempering gasoline and for storage batteries were immense. However, the dislocations in the uses for lead were relatively mild, military uses being largely the same as civilian, wherefore return to the latter did not produce much trouble. It is recognized that the lead mines of the United States are waning and that we are henceforth destined to be an importer of lead.

MAGNESIUM

Magnesium producers of the United States during three and one-half years beginning in January, 1942, shipped more than 25,000 tons of magnesium powder to domestic and lend-lease consumers. This was for tracer bullets, flares, signals, and other pyrotechnic implements of warfare. During the same period, magnesium foundries shipped almost 120,000 tons of incendiary bomb castings. This was close to aircraft as the largest user of magnesium during the war. In addition large shipments of bomb alloy ingot went to Great Britain for processing there.

At the end of 1943 capacity for the production of ingot magnesium in this country at the rate of 293,000 tons per annum had been realized. This proved clearly to have been overbuilding, for the maximum monthly production (January, 1944) was 21,000 tons and after the first quarter of 1944 the metal became obviously in excess supply and at the end of that year the monthly rate was about 4,200 tons. In the first half of 1945 production was 20,000 tons.

The military channels of consumption were naturally closed by peace. Otherwise, magnesium is but little used as such, being mainly used in alloy with aluminum, with or without an addition of zinc. Besides continued use in airplane construction, extensive uses will develop in other directions where saving of weight is desirable. At the second annual meeting of the Magnesium Association (comprising 53 companies), the president in his address was optimistic as to new uses. Among other things he suggested household appliances, office equipment, sporting goods and camping equipment. Commercially, weight will be saved in such applications as elevator cages, trucks, buses, railroad cars and perhaps some marine fittings. The efficiency of some machines with rapid motion may be materially increased. Among such machines are those used in the textile industry wherein improved methods have caused designers to turn more and more to the use of materials of light weight and increased strength, higher operating speed, and greater precision.

NICKEL

The nickel production of Canada, chiefly by the International Nickel Co., amounted to about 150,000 tons per annum in 1943 and 1944, and will probably be substantially less in 1945, a sharp shrinkage in demand having followed the end of the war and having led naturally to curtailment by the Canadian producers. Apart from the Canadian, the chief production prior to 1945 was in New Caledonia, at the rate of about 9,000 tons per annum, with which there was no interference by warfare in the Pacific. The mines and developments at Petsamo (Pechanga) in Finland, acquired by the U.S.S.R. by purchase from the International Nickel Co. late in 1944, have been in process of restoration and have not yet been brought into production. Apart from this source, the Russians have developed nickel mines in the northern part of Aktyubinsk Oblast (district) in eastern Kazakhstan. The Nicaro Nickel Co., subsidiary of the Freeport Sulphur Co., developing a deposit of nickeliferous iron ore in Mayari, Oriente Province, Cuba, entered into production early in 1945 at the rate of 1,300 tons of nickel oxide, equivalent to 1,000 tons of metal per month. The nickel oxide product of this company is, in that form, used in the manufacture of nickel steel in the United States. The elaborate and costly plant in Cuba was financed by the U. S. Government as a war measure.

The American Smelting and Refining Co. abandoned its interest in the deposit of nickel-cobalt ore near Sao de Tocantins in the state of Goyaz in Brazil, following its conclusion that, although this mine has a large deposit of ore, it would not pay under existing economic conditions.

TIN

Consumption of tin in the United States was reduced to about 60,000 long tons per annum compared with 101,000 tons in 1941. This reduction was accomplished by curtailment either by prohibition, *e.g.*, in some of the minor uses such as collapsible tubes, foil, galvanizing, etc., or by economizing in essential uses, *e.g.*, tinplate, with perhaps impairment of quality. Substantially the same thing was done in Great Britain and with approximately the same result except that the British did not venture into electroplating.

At the beginning of 1942 in the United States, there were 50,000 tons of pig tin in government stocks and 58,500 tons in private stocks. The Longhorn smeltery at Texas City, Tex., government financed, produced 15,700 tons in 1942, 20,700 tons in 1943, and 30,600 tons in 1944. This smeltery was alimented with ore imported from Bolivia and the Belgian Congo, but chiefly from Bolivia. This country also obtained 52,000 tons of pig tin by importation, which in 1942 comprised a substantial tonnage shipped from Malaya and the Netherlands East Indies prior to the Japanese occupation. Subsequently our imports of pig tin were from Belgian Congo plus a relatively small quantity transported by airplane from China. At the beginning of 1945 there were government stocks of 41,177 tons of pig tin plus 17,414 tons in private stocks, besides which we had 41,000 tons of tin, estimated as recoverable, in concentrates on hand for smelting.

In 1945 the picture did not change materially. In the first half of the year the Longhorn production was 20,000 tons, and at the end of the third quarter the expectation was that the year's production would be 41,000 tons. In the middle of 1945 we had 50,500 tons of pig tin in stock plus 36,500 in concentrates. The situation seemed therefore to be comfortable. However, the tin administration in WPB was unwilling to permit any relaxation in control.

Since the surrender of the Japanese and their evacuation from Malaya, Banka, and Billiton, reliable news as to situations there had not been received up to the end of November beyond the report that the smeltery at Penang was in working order but that the great plant at Singapore had been badly damaged. It was conjectured that the primary plant for tin production in Malaya, sluicing and dredging, had not been damaged. More damage appears to have been done in Banka and Billiton.

At the end of the war about 25,000 tons of pig tin existed in Great Britain, some of which was released to this country. A stock of uncertain tonnage was discovered in Malaya, mostly at Penang. Subsequently about 4,000 tons of pig tin and 16,000 tons of black tin (concentrates) were found in Siam. Small stocks were seized in Germany and in Japan.

The conditions of the war led to some important increases in production, especially in Nigeria, where output rose from about 10,000 tons in 1940 to about 17,000 in 1944, and in the Belgian Congo where it rose from about 10,000 to 18,400 tons. The ore deposits of the Belgian Congo, alluvial and lode, are believed to be large. Production in Bolivia which was 38,000 tons in 1940, was only about 39,000 in 1944 and will not turn out to be any larger in 1945. This production which is made under unhappy economic and physical conditions has had to be subsidized by the U. S. Government in order to aliment the Longhorn smeltery. Up to 1945 the price paid for this tin in ore was 60c. per lb.

ZINC

In this article reference has been made to the subsidizing of domestic production, the waning of our mines, and general economic conditions. Statistically it appears that the zinc mines of the United States afforded a production of 768,000 tons (their maximum) in 1942. In 1943 they produced 744,000 tons; in 1944 only 710,000; and in the first semester of 1945 only 321,000 tons with the outlook that the total for 1945 will be no more than 620,000 tons. These figures include what has been gained from the dezinking of lead smelting slags regarded as waste prior to 1940.

Besides our domestic production of zinc ore we have imported large quantities for beneficiation in our smelteries, which have an aggregate capacity for producing 1,097,000 tons of spelter per annum, and in 1943 actually produced 972,000 tons. Our imports of zinc ore have been derived chiefly from Argentina, Australia, Canada, Mexico, Newfoundland, and Peru.

In the triennium 1942-44 the imports of zinc ore into the United States were 368,000 tons in 1942; 537,000 in 1943; and 423,000 in 1944; a total of 1,328,000. Most of this ore was for domestic use, but a considerable part of it was imported for smelting on toll for the account of the British Government, and another part was for export under lend-lease. In these ways exports of spelter were 134,000 tons in 1942; 97,500 in 1943; 21,500 in 1944; a total of 253,000 tons. Besides such exportation, there was annually several thousand tons exported in the forms of zinc sheet, zinc dust, and zinc alloy.

Besides the requirement of zinc ore for the production of spelter and zinc dust there is in this country a large requirement for the production of zinc oxide, leaded-zinc and lithopone used largely for pigments, such requirement having been about 140,000 tons in 1944 with the outlook from the monthly statistics so far available that in 1945 it was about the same. To some extent the manufacturers of these products use the same ores as the producers of spelter, but to a larger extent they use ores adaptable to their own processes.

The domestic consumption of spelter was divided through the usual channels. Use for galvanizing was about stationary from 1940 to middle of 1945. Use for brass-making increased immensely in step with the use of copper for cartridge brass and bullet jackets. Use for die casting diminished sharply owing to discontinuance of manufacture of passenger automobiles. After the surrender of Japan the need for spelter for ammunition ceased, accumulation of stocks increased, and restrictions against civilian consumption were relaxed.

At the end of September, 1945 the total storage of RFC was 736,627 tons, including zinc in ore, whereof 165,460 tons were in ore stored abroad.

Zinc metallurgists, especially the distillers, were embarrassed by labor troubles all through 1945, and especially around the end of the third quarter when they were afflicted by strikes and exaggerated demands as in other industries. On top of wage, rates already high in some plants, a further raise of 20 per cent was demanded, plus double time for Sunday work and sundry perquisites. At the end of November a new strike developed.

PETROLEUM

By Robert E. Allen
Director of Information, American Petroleum Institute

END OF THE OIL WAR

From the relatively safe time-distance of four months since the war ended, it is appropriate to give expression to a few of the questions that now perplex mankind. To the first of these questions, which in various ways asks "Will there be another war?" only faith and determination will yield the ultimate answer. To the question "If war comes again, will it be another oil war?" an even less satisfactory answer is possible because of the host of unknown contingencies, not the least of which is atomic energy, that vast hall of terrible mystery.

Petroleum made world wars possible, for without it there would have been no mechanized armies, no self-sustaining task forces on the sea, and not a plane in the sky. Wars would be localized and leisurely as they were before petroleum came of age. Having made global warfare possible, petroleum contributed as much as any of our resources to the winning of the conflict just ended and which history may regard as the Second Air War, rather than the Second World War.

The will and ingenuity and fighting heart of the American people achieved a victory so decisive that the vanquished are under no illusions of a negotiated peace. Several basic industries contributed nobly to that victory. Steel, agriculture, lumber, coal, copper, aluminum, zinc, and all the rest mortgaged their present and impoverished their future, as did petroleum. These other industries provided the materials for the ships, planes, tanks, and all the means of war and it was petroleum that gave them motion and military value. It was petroleum, too, that comprised two-thirds of all the tonnage of all kinds shipped overseas.

Evidence aplenty has been found to prove that lack of mobile fuel rendered the Reichswehr impotent to stop our swift advance after the Rhine had been crossed. Lack of fuel oil in sufficient quantities kept the Japanese fleet so immobile that its units were easy prey to our far-ranging air fleets, each unit of which consumed more 100 octane fuel on each mission than the average automobile consumes during its entire life. It takes enough oil to last an oil-burning town of 5,000 people an entire year to fuel one of our big battleships or carriers for just one sweep.

Will such staggering quantities of petroleum, in so many forms, ever again be needed in war? Perhaps not, even though war itself may come. The three great inventions of the war—radar, rockets and nuclear fission—may be so perfected and combined as to make the next war brief and ghastly beyond all present comprehension. It would be naive for any survey of petroleum during the epochal year of 1945 to ignore the continuing relationship of petroleum to other sources of energy, both apparent and presumptive.

OIL RECONVERSION

Owing principally to the unique government-industry team that had directed the wartime production and distribution of petroleum products, the end of the war brought practically no reconversion problems of importance to the oil industry. One large refinery converted from the production of 100 octane aviation gasoline to the full scale production of high grade automotive fuel within 24 hours.

The government-industry partnership went into action on Dec. 8, 1941, the day after Pearl Harbor. At that time the Petroleum Industry War Council was organized with William

R. Boyd, Jr. as chairman. The purpose of the PIWC was to implement in industry the requirements for petroleum products for all military and civilian agencies, as determined by the Petroleum Administration for War, of which Secretary of the Interior Harold L. Ickes was Administrator and Ralph K. Davies was Deputy. PAW was the government member of the PAW-PIWC partnership that won such high praise from the leaders of our armed forces for exceptional service in always delivering the required petroleum products in the amount needed, whenever and wherever needed.

In conformity with oft-repeated pledges, Administrator Ickes began, immediately after VJ-Day, to relieve the petroleum industry of all the regulations and directives that had been necessary to accomplish many wartime objectives. The dissolution of PAW was so rapid that by the end of 1945 hardly a skeleton force remained. After four years of splendid war service, the PIWC and its affiliated organizations were formally dissolved on Dec. 12, 1945.

Soon after VJ-Day, PAW certified to OPA (civilian rationing agency) that petroleum supplies were such as to warrant the abandonment of rationing of gasoline and fuel oils. Rationing was suspended on Aug. 16, 1945, and for some weeks thereafter the highways of the country again were filled with millions giving vent to their pleasure at being able to come and go freely once more. Only the coming of winter and the accelerated failure of worn-out cars finally slowed down the national joyride.

As the year ended, better than prewar gasoline was available in greater quantities than ever before, and except for occasional dislocations because of strikes, unbalanced price control, and readjustment pains, fuel oil was again in good supply. For some reason price control was still maintained upon petroleum products despite the fact that petroleum was available in quantities exceeding the demand. The petroleum industry as a whole had completed the transition from war to peace as the year ended.

THE FUTURE OF PETROLEUM SUPPLY

The future of petroleum is closely linked with the three factors of supply, location, and competition. The continuing supply depends upon the discovery and development of new sources at a rate not less than that at which the older supplies are being produced and consumed. This is an elementary requirement but there are many who do not sense its importance. As a corollary to this basic essential we should at all times have a reserve productive capacity that will enable us to draw on our oil fields at greater than normal rates during an emergency such as war. It was the reserve productivity which had been developed by good practice and conservation that enabled this country to meet all war demands for oil without too severely injuring our civilian economy. Without an emergency productive capacity of about 30 per cent, gasoline and fuel oil would have been completely unobtainable by the average civilian.

During its 85-year petroleum history, the United States has produced about 32,000,000,000 barrels of oil to the end of 1945. There are at least 21,000,000,000 barrels additional already discovered and available over the 30- to 50-year period that would be required to exhaust our known oil fields by efficient methods of recovery. The magnitude of our still undiscovered petroleum reserves is, of course, an unknown quantity but many of the most competent geological authorities are confident that petroleum reserves at least equal to the 50,000,000,000 barrels in the past still await discovery in America. This takes no account of the tremendous reserves of petroleum that in due course may be obtained from the almost boundless deposits of coal, oil shale, and tar sands in the United States and Canada.

This subject of petroleum reserves is of vital and continuing interest in the public mind, which frequently

TABLE I

WORLD PRODUCTION OF CRUDE OIL

Year	United States		Rest of World		Total World
	Thousands of Barrels	Per Cent	Thousands of Barrels	Per Cent	Thousands of Barrels
1935	996,596	60	657,892	40	1,654,488
1936	1,099,687	61	691,853	39	1,791,540
1937	1,279,160	63	760,071	37	2,039,231
1938	1,214,355	61	773,686	39	1,988,041
1939	1,264,962	61	821,198	39	2,086,160
1940	1,353,214	63	790,836[1]	37	2,144,050
1941	1,402,228	63	819,002[1]	37	2,221,230
1942	1,386,645	67	694,784[1]	33	2,081,429

[1] Approximate production.
[2] Preliminary, subject to revision.

becomes confused by trying to reconcile apparently conflicting statements from responsible authorities. Actually this apparent conflict is nothing more than the conflict between optimistic and pessimistic views of the same set of facts.

A prospective shortage of an essential commodity has far more news value than a story of ample supply. The average civilian may feel alarmed or complacent about his future oil supply, depending on whose statement he reads. He can, however, rely on the American oil industry to keep him and his grandchildren supplied with oil to the degree that they are willing to pay for it and to the degree that government, state and Federal, nurtures the initiative and incentive that have made the United States petroleum industry the ever dependable source of supply that it has ever proved to be, in war as in peace.

OIL SUPPLY LOCATION
